PREFACE

This Handbook gives the accountant what other professions have long possessed—a compendium of fact-material for use in dealing with the thousands of questions that come up in his everyday work.

It brings together and explains formulas, figures, methods, and processes that are constantly needed but cannot be carried in mind for immediate use. Besides refreshing the memory, it gives, for emergencies when special works are not immediately available, the principal points of topics on which information is required. It covers, besides accounting, many other related matters.

The type of accountant who is skilled in accounting technique but neither considers nor understands the other related subjects is happily fast passing away. Accounting technique is the accountant's tool in the use of which he is particularly skilled. But the best results from the use of this tool are obtained only when the accountant avails himself also of all other branches of knowledge bearing on the case in question. The complete and satisfactory handling of an accounting question may involve consideration of quite distinct matters: finance, taxation, organization, management, banking, law, insurance, mathematics, even the physical sciences. It is in connection with the requirement for this broader range of information that the Accountants' Handbook finds its particular field.

Few individuals dealing with accounts, especially those on the staffs of business concerns, have ready access to libraries covering all the topics which they may have occasion to look up. The standard accounting works the practicing accountant will possess, often thoroughly annotated by himself; less frequently, however, will he have books on the related topics. For such information as is contained in these latter works, he will generally have to use a public or institutional library.

There is also a great mass of fact-material, isolated points of information, which is constantly needed but to look up which in the individual volumes of a library involves in the aggregate so much labor that some more convenient method of getting the information is highly desirable.

A handbook is the means for bringing this information to the accountant's elbow, for quick and continuous use. With a good handbook immediately available, the amount of information that can be instantly brought to bear on a question is literally enormous, as a glance at the hundreds of pages of

the present work will show. Moreover, the usefulness of such a book is obviously not limited to accountants but extends to treasurers, controllers, credit men, bankers, engineers interested in financial questions, and business managers. This last class of men constantly makes use of accounting methods in dealing with business problems, though they may have no interest in the technique of recording.

As has been amply demonstrated in the fields of natural science, law, medicine, and engineering, not only does a handbook greatly multiply the amount of quickly available information, but since the facts, tables, and formulas it contains have been carefully checked, it minimizes the probability of error and is far more dependable than relying on memory, attempting to reason out from fundamentals, or unskilfully applying unfamiliar methods.

To summarize the scope of this Handbook—what it includes, and what it does not include:

> It cannot give everything the accountant may have occasion to use, but it can and does give the material that is most often used.
>
> It is not intended to teach principles, as does a textbook or a treatise, but simply to refresh the memory on principles vague through infrequent use, to give in emergencies a rapid and essentially correct grasp of unfamiliar principles.
>
> It is not intended to replace special textbooks and treatises, but simply to give, when an extensive reference library is not available, a very much wider range of information than is found in any other one book.
>
> It gives facts, tables, formulas, processes, charts which, although useful, no one would attempt to carry constantly in mind.
>
> Finally, through careful selection, arrangement, and indexing of the material it saves its user an immense amount of labor; and it greatly reduces the probability of error.

The Accountants' Handbook is essentially a compilation. While there is no inconsiderable amount of original matter strewn throughout the work, the bulk of the material has been taken from a wide range of sources, credit in every case being freely given. Certain sections of the work have been prepared by specialists, carefully chosen for their ability, experience, and knowledge of the topics covered.

In the selection and arrangement of material, many individuals have been consulted, so that the work represents the collective judgment of many authorities as to what is desirable in a book of this kind and how it is best presented. A certain amount of repetition has been purposely permitted for greater convenience of use. A special effort has been made to have the index comprehensive and accurate.

The typographical arrangement is the outcome of much thought and experience, as the example of the excellent engineering handbooks now in print has been frankly followed. The engineering profession is unquestionably deserving of great credit in connection with the development of this invaluable type of reference work.

It is quite possible that the experience of users may lead to the detection of minor errors or disclose the desirability of further developments in the structure or content of this Handbook. Any suggestions in this regard will be appreciated by the publishers.

In conclusion, acknowledgment is due to those who by their co-operation have made possible the publication of the Handbook with least delay and greatest accuracy and completeness. The contributors, whose names are listed elsewhere, have endeavored to make the book a working organism rather than a mere collection of uncorrelated data. The editorial staff of the Ronald Press Company have brought to the work the experience of years in the preparation of many of the standard works dealing with the topics covered. John T. Madden, C. P. A., Professor of Accounting and Assistant Dean, School of Commerce, Accounting and Finance of New York University, has read much of the manuscript from the point of view of technical accuracy. R. B. Kester, C. P. A., Professor of Accounting in Columbia University; B. F. Young, Assistant Chief Accountant of the New York Telephone Company; Thomas Conyngton of the New York Bar; H. S. Kirby, Auditor of the Irving Bank–Columbia Trust Company; S. F. Brewster, of the Federal Bar; F. P. Pitzer of the Equitable Life Assurance Society of the United States; Edward B. Millar, C. P. A.; and Wallace Clark, Consulting Industrial Engineer, have assisted with suggestions and criticisms.

To Dr. Saliers, general editor, on whom the principal burden of the work has fallen, particular acknowledgment should be made.

BUSINESS LAW

CONTENTS

SECTION 1

BUSINESS LAW

Foreword

The object of this section is to present a digest of the fundamental principles of law on those subjects which are most likely to be met with by accountants and business men. Only the more important phases of the various subjects are set forth as complete as may be necessary to present principles for ready reference; no effort has been made to treat subjects exhaustively or to make the distinctions of the various phases of law developed by court decisions. Such a work would be of interest to lawyers and law students but would be out of place in a handbook.

In treating the subjects general principles were formulated from court decisions. Wherever possible the language of the court is used, or digests where the decisions are lengthy. For those who desire to make further and more detailed inquiry on any point, authorities and cases are cited in many instances. For more complete selection of cases and more comprehensive treatment of the subjects, readers can secure adequate information in the well-known legal reporting agencies such as Corpus Juris, Cyc., Century and Decennial Digests, as well as the many state digests and reports.

The subjects are divided into a major and a minor classification, the former consisting of Contracts, Corporations, Negotiable Instruments, and Partnerships; the latter, treated in more limited scope, of Agency, Bailments, Insurance, Sales, and Suretyship and Guaranty.

Law of Contracts

DEFINITION.—A contract is "an agreement upon sufficient consideration to do or not to do a particular thing." (2 Blackstone Commentaries, p. 442.) A more complete definition is: "A bargain or agreement voluntarily made upon good consideration, between two or more persons capable of contracting to do, or forbear to do some lawful act." (*Justice* v. *Lang*, 42 N. Y. 493.)

CLASSIFICATION.—There are various classifications of contracts, such as:

1. Express and implied contracts
2. Executed and executory contracts
3. Contracts of record
4. Specialties or contracts under seal
5. Void, voidable, and valid contracts

Express Contracts.—"A contract is express when the agreement is formal, and stated either verbally or in writing." (*Gillan* v. *O'Leary*, 124 App. Div. [N. Y.] 498.)

Contracts Implied in Fact.—"A contract may be implied where an agree-

ment in fact is presumed from the acts of the parties and this is the proper meaning of an implied contract." (*People* v. *Dummer*, 274 Ill. 637; also *People* v. *Speir*, 77 N. Y. 144; *Baker* v. *Stoutmeyer*, 2 McG. [La.] 61.)

Contracts Implied in Law.—Generally called **constructive** or **quasi-contracts.** "Constructive contracts, which are fictions of law adopted to enforce legal duties by actions of contract, where no proper contract exists, express or implied." (*Hertzog* v. *Hertzog*, 29 Pa. 465.) "The term implied contract has also been applied to a class of obligations which are created by law without the assent of the party upon whom the obligation is imposed, on the ground that they are dictated by reason and justice. They are not contract obligations in the true sense because there is no agreement of the parties, but they are constructive contracts created by law." (*People* v. *Dummer*, 274 Ill. 737; also *Navada Co.* v. *Farnsworth*, 89 Fed. 164; *Gutta Percha etc. Mfg. Co.* v. *Houston*, 108 N. Y. 276.)

Executed Contracts.—"One in which the object of the contract is performed." (*Fletcher* v. *Peck*, 6 Cranch [U. S.] 87.)

Executory Contracts.—"A contract to do some future act." (*Hale* v. *Sharpe*, 6 Caldw. [Tenn.] 275.) "Whilst any act remains to be done the contract is understood to be executory." (*Farrington* v. *Tennessee*, 95 U. S 679; also *Fox* v. *Kitton*, 19 Ill. 519; *Justice* v. *Lang*, 42 N. Y. 493.)

Contracts of Record.—These are judgments and recognizances. "A judgment is a contract of the highest nature known to the law." (*Taylor* v. *Root*, 4 Keyes [N. Y.] 344.) A recognizance is an obligation entered into before a court of record, undertaking to do or not to do a certain thing. Generally referred to as a bond to keep the peace, appear as a witness, pay a debt, etc.

Specialties or Contracts under Seal.—Contracts under seal derive their legal effect from the formality of the instrument, the essential elements of which are the seal and delivery. (Leake Digest, pp. 134–146.) Under the common law consideration was not necessary in sealed contracts, but most of the states have adopted statutes to the effect that a seal is only presumptive evidence of a consideration (*Home Ins. Co.* v. *Watson*, 59 N. Y. 390) which may be rebutted. "In contracts made by deed under seal, a consideration is not essential to give validity to the promise, as it is in the case of simple contracts." (Leake Digest, pp. 134–146.)

Parol or Simple Contracts.—These include all contracts in writing not under seal nor of record, and also all oral contracts.

Void Contracts.—An agreement in which one of the four necessary elements of a contract is absent, has no legal effect, and is not binding on either party. In reality it is no contract at all. The expression "void contract," although used, is a misuse of terms.

Voidable Contracts.—A contract which is binding on one of the parties but is capable of being rejected or accepted at the will of the other.

Valid Contracts.—One binding on the parties and of full legal effect.

ESSENTIAL REQUIREMENTS.—The following essential requirements are necessary to make a contract enforcible at law:

1. Parties legally competent
2. Agreement
3. Sufficient consideration
4. Legality of object or subject matter

1. PARTIES.—All persons are competent to enter upon enforcible contracts except those partially or totally disqualified under the law.

TOTAL DISQUALIFICATION.—One legally declared incompetent by a court having jurisdiction and where a guardian is appointed to administer his affairs, has no power to make an enforcible contract in the state in which he was judicially declared incompetent. Such persons include insane persons and spendthrifts.

PARTIALLY DISQUALIFIED—MINORS.—At common law and in most states by statute, an infant is a person under 21 years of age. Contracts of an infant may be valid or voidable at his option.

Valid contracts are for necessities furnished in accordance with station in life. One is liable for such at their reasonable value, not at the agreed price. Strictly speaking, the liability is on *quantum meruit*, i.e., quasi-contract and not on contract. The items must fall under the classification of necessities required for physical, mental, or spiritual welfare, such as food, clothing, medical attendance, shelter, ordinary education, but does not include articles of pleasure, ornament, or luxury.

Voidable Contracts.—Contracts of an infant, exclusive of those for necessities, are voidable at his option during his infancy, and on becoming of age he may avoid or ratify them.

Disaffirmance of Contract.—This may be done by an infant at any time but must be completed within a reasonable time after he becomes of age, except that deeds to land cannot be disaffirmed until he reaches his majority.

Return of Value Received.—The courts of the various states are in conflict on this subject. Some courts hold that an infant, although he has received the benefits under an executed contract, may recover from the other party what he has paid even though he cannot return what he has received. (*MacGreal* v. *Taylor*, 167 U. S. 688; *Reynolds* v. *McCurry*, 100 Ill. 356, *Gillis* v. *Goodwin*, 180 Mass. 140.) This rule is followed in New York. Other jurisdictions hold that an infant who has received a benefit under an executed contract cannot recover the consideration on repudiation by him without returning what he received. (*Johnson* v. *Ins. Co.*, 56 Minn. 365.)

Personal Defense.—Infancy is a personal defense available to the infant only and cannot be pleaded by the other party to the contract.

Torts.—Infants are liable for their torts, i.e., wrongs such as frauds, trespass, etc.

Minor's Representation of Full Age.—A minor who, fraudulently representing himself or leading others to think him of full age, enters upon a contract, will be held liable in a court of equity on his contract. The other party on discovery of the fraud may rescind and recover from the infant what he has parted with. The liability of the infant is for his fraud (*Studwell* v. *Shapter*, 54 N. Y. 249; *Burnett* v. *Williams*, 30 Fed. Rep. 697) and not on contract (*Badger* v. *Phinney*, 15 Mass. 359).

INSANE PERSONS.—

Legally Declared.—Contracts of a person judicially declared insane and placed under a guardian are absolutely void.

Not Legally Declared.—The general rule is that the law presumes every person sane until the contrary is established; hence a contract of a person of unsound mind is voidable only on establishing his insanity. The burden of proof is upon the person alleging insanity.

Degree of Insanity.—An insane person's contract is voidable where his infirmity is such as to render him incapable of understanding the nature of the contract and its probable consequence. (*Perry* v. *Pearson*, 135 Ill. 218; *Brown* v. *Brown*, 108 Mass. 386.) It need not be entire want of reason or

permanent insanity; yet it must be something more than mere weakness of intellect. (*Guild* v. *Hull*, 127 Ill. 523.)

Executed Contracts.—The rule followed by most states is that an executed contract of an insane person is not voidable. These courts follow the leading English case of *Moton* v. *Camroux*, 2 Exch. 489, which states: "The modern cases show that when that state of mind was unknown to the other party, and no advantage was taken of the lunatic the defense cannot prevail, especially where the contract is not merely executory, but executed in whole or in part, and the parties cannot be restored to their original positions." Followed in: *Mutual Life Ins. Co.* v. *Hunt*, 79 N. Y. 541; *Burnham* v. *Kidwell*, 113 Ill. 425. Contra principle followed in: *Seaver* v. *Phelps*, 11 Pick. 304; *Rogers* v. *Blackwell*, 49 Mich. 192.

ALIENS.—In practically all the states aliens have the same rights as subjects to make and enforce contracts regarding personal property. In a few states restrictions are imposed in regard to real estate.

Alien Enemies.—An alien enemy cannot make a new contract or enforce existing contracts during the continuance of hostilities. Existing contracts are as a rule suspended during hostilities. (*U. S.* v. *Grossmayer*, 9 Wall. 72.)

MARRIED WOMEN.—In most states married women have full rights to enter into enforcible contracts. A few states, however, still retain restrictions more or less approaching the old common law rule that married women cannot make a valid contract.

CORPORATIONS.—Corporations have full authority to enter into contracts within their express or implied corporate powers.

Ultra Vires Contracts.—An executory contract beyond its corporate powers is said to be *ultra vires* and is void. A corporation, however, is liable on its *ultra vires* contracts where it has accepted benefits under the contract. (See "Law of Corporations.")

2. **AGREEMENT.**—Agreement or mutual assent, which is the result of an offer and acceptance, is necessary for every contract. "Mutual assent is assent to the same thing in the same sense and under a common understanding of the stipulations agreed to." (*Martin* v. *Thrower*, 3 Ga. A. 784; also *Fire Ins. Assn.* v. *Wickham*, 141 U. S. 564; *Harper* v. *Goldschmitt*, 156 Cal. 245; *Harlow* v. *Curtis*, 121 Mass. 320; *Emerson* v. *Pacific Coast etc. Packing Co.*, 96 Minn. 1; *Livingston* v. *Livingston*, 173 N. Y. 377; *Teesdale* v. *Bennett*, 123 Wis. 355.)

OFFER.—Must be made with intent to create a contract on acceptance and be certain and free from ambiguity. The extent of the obligation is governed by the terms of the offer, for an acceptance is required to be identical with the offer made. "Where an offer and acceptance are relied on to make a contract, the offer must be one which is intended of itself to create legal relations on acceptance, and the offer intended to create legal relations must be so complete that on acceptance an agreement containing all the necessary terms is found." (13 C. J. Contracts 268; *Elks* v. *North State L. Ins. Co.*, 159 N. C. 619; also *Woods* v. *Evans*, 113 Ill. 186; *Marble* v. *Standard Oil Co.*, 169 Mass. 553; *Canet* v. *Smith*, 173 App. Div. [N. Y.] 29; *Wolfram* v. *Schwepke* 123 Wis. 19.)

Offer Must be Communicated.—An offer must be communicated by word or conduct. The mode or manner is immaterial. (*The Palo Alto*, 18 Fed. Cases 10,700; *College Mill Co.* v. *Fidler*, 58 S. W. [Tenn.] 382.)

Revocation of Offer.—An offer may be withdrawn any time before it is accepted or the acceptance put in course of communication. (*Moffet* v. *Rochester*, 178 U. S. 373; *Martin* v. *Hudson*, 81 Cal. 42; *Corbett* v. *Cronkhite*, 239 Ill. 9; *Benton* v. *Springfield Y. M. C. A.*, 170 Mass. 534.) Where time for acceptance is given, it may still be withdrawn before the expiration of that time unless the agreement to hold it open for that time is supported by a separate consideration. (*Minneapolis etc. R. Co.* v. *Columbia Rolling Mills Co.*, 119 U. S. 149; *Schenectady Stove Co.* v. *Holbrook*, 101 N. Y. 45.)

Lapse of Offer.—An offer lapses so that subsequent acceptance will have no effect by

1. Expiration of the time for acceptance.
2. Expiration of a reasonable length of time where no time is specified.
3. Death or insanity of the parties before acceptance.
4. Dissolution of partnership before acceptance where one of the parties is a partnership.

ACCEPTANCE.—A contract results from the acceptance of an offer. "To accept a contract is to admit it and agree to it; to accede to it; to assent to it; the ordinary meaning embodies assent and agreement." (*State* v. *Columbus Public Service Board*, 81 Oh. 218; also *Laprade* v. *Fitchburg etc. R. Co.*, 205 Mass. 77; *Graff* v. *Buchanan*, 46 Minn. 24; *Chicago etc. R. Co.* v. *Dane*, 43 N. Y. 240; *Hall* v. *Wilson*, 6 Wis. 433.)

Who May Accept.—An offer can be accepted only by the person to whom it is made and is not transferable to another.

Public Offers.—Public offers of rewards, etc., from their nature cannot be made to a definite person and cannot become binding contracts until accepted, within the scope of the offer by some person. (*Schoestene* v. *Iselin*, 69 Hun 250; *Crowell* v. *Hopkinson*, 45 N. H. 9.)

Sufficiency of Acceptance.—"An acceptance must correspond to the offer at every point, and must conclude the agreement." (*U. S.* v. *P. J. Carlin Const. Co.*, 224 Fed. 859.) "An acceptance, to be good, must, of course, be such as to conclude an agreement or contract between the parties. And to do this, it must in every respect meet and correspond with the offer, neither falling within nor going beyond the terms proposed, but exactly meeting them at all points and closing with them just as they stand." (*Potts* v. *Whitehead*, 23 N. J. Eq. 512; also *Kincaid* v. *Eaton*, 98 Mass. 139; *Poel* v. *Brunswick-Balke-Collender Co.*, 216 N. Y. 310; *Baker* v. *Holt*, 56 Wis. 100.)

Communication of Acceptance.—An acceptance to consummate a contract must be communicated to the offeror or must be put in the course of communication by the acceptor. (*Cleveland etc. R. Co.* v. *Shea*, 174 Ind. 303; *Busher* v. *N. Y. Life Ins. Co.*, 72 N. H. 551.)

Revocation of Acceptance.—An acceptance can be revoked only by a communication to that effect before the acceptance is consummated. (*Commercial Ins. Co.* v. *Hallock*, 2 N. J. L. 645.)

OFFER AND ACCEPTANCE—METHODS OF COMMUNICATION.—An acceptance becomes an enforcible contract from the moment it is put in the same course of communication followed by the offerer. The fact that the offerer fails to receive the acceptance so communicated has no effect. If, however, a different mode of communication is followed by the acceptor, his acceptance does not become a binding contract until it is received by the offerer.

Mail and Telegraph.—An offer sent by mail or telegraph is of no effect until it reaches the offeree. The acceptance of the offer becomes a contract only

when it is mailed, i.e., a properly addressed letter of acceptance with sufficient postage put in a United States post box or a prepaid telegram is given to the Telegraph Company. Failure of the offerer to receive such notification of acceptance does not affect the binding force of the contract.

3. CONSIDERATION.—"Something of value received by one party or parted with by the other by reason of the contract." (*Grantt* v. *Isett*, 81 Kans. 246.) "That may be some right, interest, profit or benefit accruing to one party, or some forbearance, detriment, loss or responsibility given, suffered or undertaken by the other." (*Ft. Wayne etc. Tract. Co.* v. *Justus*, 108 N. E. [Ind.] 754.) "Consideration may be described generally as some matter accepted or agreed for as a return or equivalent for the promise made, showing that the promise is not made gratuitously." (*Donahue* v. *Rich*, 2 Ind. A. 540.)

NECESSITY OF CONSIDERATION.—A consideration is essential to the validity of every contract. (*National Elect. Sig. Co.* v. *Fessenden*, 207 Fed. 915; *Hendy* v. *Kier*, 59 Cal. 138; *Bonney* v. *Bonney*, 237 Ill. 452; *Chase* v. *Chase*, 191 Mass. 556; *Fipe* v. *Blake*, 38 Minn. 426; *Belknap* v. *Bender*, 75 N. Y. 446.)

WHAT CONSTITUTES CONSIDERATION.—As a general rule, in accordance with the definition given above, there is sufficient consideration for a promise if there is any benefit to one party or any loss or detriment to the other. If something valuable flows from the person to whom a promise is made or if he suffers some loss or inconvenience and the promise is the inducement to the transaction, there is said to be a consideration. (*Townsley* v. *Summerall*, 2 Pet. 170; *Masson* v. *Morton Bldg. Co.*, 28 Cal. A. 330; *Buchanan* v. *International Bank*, 78 Ill. 500; *Chapin* v. *Lapham*, 20 Pick 467; *White* v. *Baxter*, 71 N. Y. 454; *Pabst Brewing Co.* v. *Milwaukee*, 126 Wis. 110.)

GOOD AND VALUABLE CONSIDERATION DISTINGUISHED.—A **good consideration** is love or natural affection by reason of the relation of the parties by blood, marriage, or family. A **valuable consideration** is a benefit or a detriment as set forth in the definition of consideration.

MUTUAL PROMISES.—Mutual promises concurrently made are considerations for one another. The one promise, and not performance, constitutes the consideration for the other. (*A. B. Dick Co.* v. *Fuller*, 213 Fed. 98; *Morrill* v. *Colehour*, 82 Ill. 618; *Price* v. *Muriat*, 107 Mass. 49; *Bayne* v. *Greiner Est.* 118 Minn. 350.)

MUTUALITY OF OBLIGATION IS ESSENTIAL.—"A contract is mutual where the agreement entered into between the parties is binding on each alike touching its ultimate performance." (13 C. J. Contracts 321; *Baumhoff* v. *Oklahoma City Elec. etc. Co.*, 14 Okl. 127; also *Harper* v. *Goldschmitt*, 156 Cal. 245; *Corbett* v. *Cronkhite*, 239 Ill. 9; *Abbott* v. *Hapgood*, 150 Mass. 248; *Grossman* v. *Schenker*, 206 N. Y. 466.)

LEGAL LIABILITY.—The promise, to constitute a good consideration for a promise, must impose some legal liability on the person making it. A promise to do what the promisor is legally bound to do is not a consideration. The promise must be lawful, definite, and certain.

WAIVER OF A LEGAL RIGHT.—The relinquishment of a legal right is a sufficient consideration. (*In re All Star Feature Corp.*, 232 Fed. 1004; *Hanchett* v. *Ives*, 171 Ill. 122; *Hamer* v. *Sidney*, 124 N. Y. 538.) A promise to refrain from doing something which the promisor has no legal right to do, is not a consideration for a promise. (*Sheppey* v. *Stevens*, 177 Fed. 484

Crosby v. *Ward*, 6 N. Y. 369; *Everingham* v. *Meighan*, 55 Wis. 354.) The relinquishment of rights may be those under contract generally, the right to sue for damages, claims of a beneficiary in an estate, dower, courtesy, liens, etc. As a general rule a promise to perform an existing legal obligation is not a valid consideration. (*Harris* v. *Cassidy*, 107 Ind. 158; *Parrott* v. *Mexican Cent. R. R. Co.*, 207 Mass. 184; *Carpenter* v. *Taylor*, 164 N. Y. 171.)

PAST CONSIDERATION.—A past consideration will not support a promise except where the past consideration was based on a previous request. (*Moore* v. *Elmer*, 180 Mass. 15; *Aultman* v. *Kennedy*, 33 Minn. 339; *Arend* v. *Smith*, 151 N. Y. 502.)

4. SUBJECT MATTER.—The subject matter or object of a contract is that which the agreement is about and may be anything concerning the affairs of mankind not forbidden by law or in derogation to human welfare.

MUST BE LAWFUL.—Unlawful agreements are those in violation of positive law and those which, although not contravening the law, are against the welfare of mankind and are not enforcible on the ground of public policy.

IN VIOLATION OF THE POSITIVE LAW.—If the object of an agreement is illegal, a contract does not result. (*U. S. Bank* v. *Owens*, 2 Pet. 527; *Harvey* v. *Merrill*, 150 Mass. 1; *Debbit* v. *Lander*, 72 Wis. 120.) Agreements to violate the law are illegal. (*U. S.* v. *Trans Missouri Freight Assn.*, 166 U. S. 290; *Coat* v. *Phillip*, 56 N. Y. 31.)

FRAUD AGAINST THIRD PERSONS.—An agreement to commit a fraud against a third person (*Douglas State Bank* v. *Lewinson*, 192 Ill. A. 364; *Sprague* v. *Webb*, 168 App. Div. 292), or the public in general (*Clinch* v. *Proctor*, 66 Fed. 240; *Nickerson* v. *English*, 142 Mass. 267; *Matesne* v. *Horwitz*, 101 N. Y. 469), or the commission of a civil wrong (*Randal* v. *Howard*, 2 Black. 585; *Adams* v. *Outhouse*, 45 N. Y. 318; *Rice* v. *Wood*, 113 Mass. 133) against a third person, is illegal and void even though the wrong itself may not be a crime or an indictable offense.

AGREEMENTS AGAINST PUBLIC POLICY.—Agreements opposed to public policy are illegal and void. (*Teal* v. *Walker*, 111 U. S. 242; *Palmbaum* v. *Magulsky*, 217 Mass. 306; *Richardson* v. *Crandall*, 48 N. Y. 348; *Roch* v. *Ekern*, 162 Wis. 291.)

Public Policy Defined.—"The term 'public policy' as applied to contracts embraces all acts or contracts which tend clearly to injure the public health, the public morals, or confidence in the purity of the administration of the law, or to undermine that sense of security for individual rights, whether of personal liberty or private property which every citizen has a right to feel." (13 C. J. Contracts 425; *Holland* v. *Sheehan*, 108 Minn. 362.)

Test of Public Policy.—The test of public policy is the evil tendency of a contract rather than the actual injury. Just what public policy is in a given jurisdiction is for the courts to decide, as it varies with time and place.

General classification of agreements against public policy:

Against good morals such as,

1. Agreements of an immoral nature.
2. Gambling and wagering transactions.
3. Agreements to commit a fraud, breach of trust or confidence.

Against marital relations

1. Absolute restraint of marriage.
2. In derogation of the marital relation.

Against public service

1. Interfering with legislative actions.
2. Influencing by corrupt means operations of a political subdivision of the nation.
3. Traffic in public office.
4. Influencing courts of justice by corrupt means.

Unreasonable restraint of trade.—Agreements to prevent competition, increase prices, or create monopolies.

Agreements in Restraint of Trade.—Agreements in unreasonable restraint of trade are illegal (*Addyston Pipe etc. Co.*, 85 Fed. 271), but agreements in reasonable restraint of trade are valid (*Carter* v. *Alling*, 43 Fed. 208). Modern authorities gauge the validity of contracts on the reasonableness of the restraint imposed as necessary to protect the parties in whose favor it was imposed. Leading cases are: *Gibbs* v. *Consolidated Gas Co.*, 130 U. S. 369; *Diamond Match Co.* v. *Roeber*, 106 N. Y. 473.

FORM OF CONTRACT.—

Oral.—Parol or simple contracts, except where required by statute to be written, may be made by word of mouth and are enforcible as such except for the difficulty of proving the contract.

Written.—In practically all of the states certain parol contracts must be in writing and sometimes follow prescribed forms. The foundation of most of the state laws in this respect is the Statute of Frauds mentioned hereinafter. Aside from the contracts under that statute there are a number of others not so general which must be in writing, such as insurance contracts which under the common law could be oral and are now generally required to be in writing and in some states in statutory form; contracts for the recovery of debt barred by the statute of limitations; promise of an infant on becoming of age to pay for debts contracted during minority; assignments of patents and copyrights.

Statute of Frauds.—To prevent frauds and perjury in proving contracts, most states have adopted statutes modeled after the English Statute of Frauds enacted in 1676 during the reign of Charles II. These statutes require that certain contracts shall be proven by some memorandum in writing.

Contracts Required to be in Writing.—Under the statute the following contracts to be enforcible must be in writing and signed by the person to be charged:

1. Promises or contracts of executors and administrators to pay out of their personal estate debts due from the estate they are administering.

2. Contracts not to be performed within one year from the making thereof. This refers to contracts which cannot be completed within the year. The statute does not apply to contracts which may be performed within a year but may possibly extend beyond the year. The general interpretation of the rule to bring contracts under the statute is that it must appear by their terms that performance cannot be completed within a year from the time the contract is made.

3. Promises to answer for the debt, default or miscarriage of another. This refers to suretyship and guaranty. The promise must be made to the creditor and there must be a present and prospective liability. To be within the statute the liability of the original debtor must continue and the promisor's liability become collateral. A release of the original debtor is a novation and takes it out of the statute, hence it need not be in writing.

4. Promises made in consideration of marriage, except mutual promises. This refers to promises to pay money, transfer property, make a marriage settlement or other act in consideration of a marriage taking place, but does not refer to the promise to marry. (*Lloyd* v. *Fulton*, 91 U. S. 479.)

5. A promise to pay a debt discharged in bankruptcy.

6. A contract for the sale of personal property over a fixed amount, which varies in the different states. (Explained more fully under "Sales.")

7. A contract for the sale of lands, tenements and hereditaments or any interest in them. This refers to the contract to sell and not the deed conveying title, which must be in writing and generally sealed. The natural growth and product of land are an interest in land, and contracts to sell or buy such must be in writing. Crops or other products of the land raised by cultivation and labor are not an interest in land and their sale need not be in writing. A lease or rental agreement for more than one year must be in writing. An easement (*Mumford* v. *Whitney*, 15 Wend. [N. Y.] 380) and right of way (*Bonelli* v. *Blackmore*, 66 Miss. 136) are interest in land and must be in writing.

EFFECT OF CONTRACT—REALITY OF CONSENT.—As stated, one of the requisites of a valid contract is agreement. This is not obtained without real consent of both parties, which cannot be said to exist where there is mistake, fraud, duress, undue influence, or misrepresentation.

MISTAKE.—Is occasioned by a misconception of some matter and may be a mistake of fact or a mistake of law.

Mistake of Fact Defined.—Mistake of fact is a mistake not caused by the neglect of a legal duty on the part of the person making the mistake and consisting in:

1. An unconscious ignorance or forgetfulness of a fact, past or present, material to the contract, or
2. Belief in the present existence of a thing material to the contract, which does not exist, or in the past existence of such a thing, which has not existed. (South Dakota Civil Code No. 1206.)

Mistake Affecting Validity.—"Mistake does not of itself affect the validity of contracts at all. But the mistake may be such as to prevent any real agreement being formed in which case the contract is absolutely void both at law and in equity." (*Kyle* v. *Kavanaugh*, 103 Mass. 356.)

Mistake as to Parties—Subject Matter.—A mutual mistake as to the subject matter, that is, what the contract is about or what is to be done under the contract, or the identity of the persons with whom the contract was made, avoids the contract as there is no meeting of the minds.

As to Legal Effect and Value of Subject Matter.—A mistake regarding the legal effect or the value of the subject matter does not affect the validity of a contract.

Mistake of One of the Parties.—A mistake of one of the parties only and not known to the other, does not affect a valid contract. (*Ellicott Mach. Co.* v. *U. S.*, 44 Ct. Cl. 127; *Monks* v. *West Street Imp. Co.*, 149 App. Div. [N. Y.] 504; *Bostwick* v. *Mutual Ins. Co.*, 116 Wis. 392.)

Mistake—Mutual Mistake.—One of material facts will avoid the agreement. (*Allen* v. *Hammond*, 11 Pet. 63; *Flynn* v. *Smith*, 111 App Div. [N. Y.] 870; *Hoops* v. *Fitzgerald*, 204 Ill. 325.) "Mutual mistake consists of a clear showing of a misunderstanding, reciprocal and common to both

parties, in respect to the terms and subject matter of the contract, or some substantial part thereof." (13 C. J. Contracts 375; *C. H. Young Co.* v. *Springer*, 113 Minn. 382.)

Mistake of Law.—This does not avoid the contract. The rule is well established that a mistake of law or the legal effect of a contract will not affect the enforcibility of the agreement. (*Lamborn* v. *Dickinson County*, 97 U. S. 181; *Soley* v. *Jones*, 208 Mass. 561.) Mistake as to the law of other states is regarded as mistake of fact and may under certain circumstances avoid the contract.

Mistake of Fact—Remedies.—Remedies are both equitable and legal where contracts are entered under mistake of fact. **In equity,** where specific performance is prayed for, the defense of mistake may be interposed or a bill may be filed to have the contract declared void. In case of mistake of form or expression, the instrument may be reformed in accordance with the real intent of the parties.

At Law.—The contract may be repudiated and all values paid thereunder recovered.

WRITTEN CONTRACTS—CONTENTS UNREAD AND UNKNOWN.—The general rule is that a person cannot avoid his written contract on the ground that he did not know its contents, did not read it, or that he supposed it was different in its terms or mere form. (*Black* v. *Wabash etc. R. Co.*, 111 Ill. 351; *Wood* v. *Mass. Mutual Acc. Assn.*, 174 Mass. 217; *Peo* v. *Dunbar Contracting Co.*, 215 N. Y. 416.) "It will not do for a man to enter into a contract; and, when called upon to respond to its obligations, to say that he did not read it when he signed it, or did not know what it contained. If this were permitted, contracts would not be worth the paper on which they were written. But such is not the law. A contractor must stand by the words of his contract, and, if he will not read what he signs, he alone is responsible for his omission." (*Upton* v. *Tribilcock*, 91 U. S. 45.)

EXPRESSED INTENTIONS ARE BINDING.—A person is bound on his contracts in accordance with the reasonable meaning of his expressed intention regardless of what his secret intentions were. "The rule of law is stated in *Freeman* v. *Cooke*, 2 Exchange 654. . . . . If, whatever a man's real intention may be, he so conducts himself that a reasonable man would believe that he was assenting to the terms proposed by the other party, and the other party upon that belief enters into the contract with him, the man thus conducting himself would be equally bound as if he had intended to agree to the other party's terms." (*Smith* v. *Hughes*, L. R. 2 Q. B. 597; also *Dybarg* v. *Minneapolis Sanitarium*, 128 Minn. 292.)

FRAUD.—Fraud is a false statement of a material fact made with knowledge of its falsehood or reckless disregard as to whether it is true or false, with the intention that it shall be acted upon by another and which is relied and acted upon by the other party to his injury.

Remedies of Defrauded Party.—The party so deceived in entering upon a contract, upon discovery of the deception can avoid the contract or maintain an action for the damages he sustained. (*Cooper* v. *Schlesinger*, 111 U. S. 148; *Krankowski* v. *Knapp*, 268 Ill. 183; *Adams* v. *Gillig*, 199 N. Y. 314; *Lee* v. *Burnham*, 82 Wis. 209.)

Must Be a Statement or Representation.—Mere non-disclosure does not constitute fraud unless there is a duty to disclose all facts to the other party or unless active steps are taken to conceal the truth.

Opinion.—Mere expression of opinion, although erroneous, is not fraud.

(*John* v. *Stephenson*, 154 U. S. 625; *Bryant* v. *Ocean Ins. Co.*, 22 Pick. 200; *Swanson* v. *Fisher*, 148 Ill. A. 104.)

Expectation of Future Act.—An expectation, representation, or promise as to some future act or performance which may have brought about the agreement, will not constitute fraud where the expectation is not realized. (*Southern Dev. Co.* v. *Silver*, 125 U. S. 247; *Miller* v. *Sutliff*, 241 Ill. 521; *Dave* v. *Morris*, 149 Mass. 188; *Adams* v. *Gillig*, 199 N. Y. 314.)

Representation of Law.—An erroneous representation of law is not fraud. (*Brink* v. *Johnson*, 146 Fed. 209; *Hooker* v. *Midland Steel Co.*, 215 Ill. 444; *Gormely* v. *South Side Gym. Assn.*, 55 Wis. 350.)

Trade Talk.—Commendable expressions as to value appearance, quality, prospects, etc., are not sufficient to constitute fraud.

Effect of Fraud.—An agreement procured by fraud is voidable, but not void. The defrauded party has the right to elect whether he will treat the contract as binding or refuse to be bound by it. (*Foreman* v. *Bigelow*, 9 F. Case No. 4934, 4 Cliff 508; *Wallace* v. *Pierce*, 97 Mass. 46; *Elmer* v. *Loper*, 66 N. J. L. 50; *Adams* v. *Gillig*, 199 N. Y. 314.)

Remedies of Party Defrauded.—He may either:

1. Affirm the contract, keeping what he has under it and sue for the damages he sustained by reason of the fraud. The affirmance of the contract is not a waiver of the fraud and does not bar the right to recover damages (*Hecksher* v. *Edenborn*, 203 N. Y. 210; *Gibson* v. *Nelson*, 111 Minn. 183; *Bumbs* v. *Burns*, 137 Fed. 781); or,
2. Rescind the contract and sue to recover what he has parted with. To rescind the contract he must return the consideration he received. If he retains the benefits under the contract his right to rescind is gone.

DURESS.—Duress is a threatened or actual violence or imprisonment reasonably sufficient to cause such apprehension that a person will enter into a contract against his own free will. "Duress exists where one is induced, by another's unlawful act, to make a contract or perform some act under circumstances which prevent his exercising his free will." (*Hackley* v. *Headley*, 45 Mich. 569.) "Duress is a species of fraud in which compulsion in some form takes the place of deception in accomplishing the injury." (*Kans* v. *Gracey*, 162 Iowa 671.)

Effect of Duress.—A contract entered into by a person under duress is voidable at his option, but not void. As in fraud, the contract may be disaffirmed or ratified.

Remedies.—"One who by duress is compelled to sign a contract whereby he parts with his property may proceed in equity for a recession, may rescind by his own act and sue at law, or may allow the contract to stand and sue for damages." (*Neibuhr* v. *Gage*, 99 Minn. 149.) "Unlawful duress is a good defense to a contract if it includes such degree of constraint or danger, either actually inflicted or threatened and impending, as is sufficient in severity or apprehension to overcome the mind and will of a person of ordinary firmness." (*U. S.* v. *Huckabee*, 16 Wall. [U. S.] 414.)

UNDUE INFLUENCE.—"Undue influence is a kind of mental coercion, which destroys the free agency of one and constrains him to do that which is against his will and what he would not have done if left to his own judgment and volition, so that his act becomes the act of the one exerting the influence rather than his own act, such act being one to his own injury, or to the injury of some one upon whom he would if left to his own free will, have bestowed a benefit." (*Beard* v. *Beard*, 173 Ky. 131.)

What it Consists of.—"Undue influence . . . consists in acts which though not fraudulent, amount to an abuse of the power which circumstances have given to the will of one individual over that of another." (Holland Jur., p. 264.) Undue influence is a form of fraud and consists of taking unfair advantage of another's weakness of mind, necessities, and distress, or by reason of the confidential relations or family relations existing between the parties.

Effect of Undue Influence.—A contract entered into under undue influence is voidable at the option of the injured party. To affect a contract on the ground of undue influence it must be shown to be such an influence as the law condemns. (*Bowdoin College* v. *Merritt*, 75 Fed. 480; *Roberts* v. *Little*, 9 Misc. 497; *Batavia Bank* v. *North*, 114 Wis. 637.)

ILLEGAL CONTRACTS.—

Effect of Illegality—General Rule.—The law leaves the parties where it finds them and will afford no relief. (*Sage* v. *Hampe*, 235 U. S. 99; *Pelosi* v. *Bugbee*, 217 Mass. 579; *Hart* v. *City Theatres Co.*, 215 N. Y. 322.)

Exception to General Rule—Parties Equally Guilty.—Where parties to an illegal contract are in *pari delicto*—equally guilty—but public policy requires the intervention of the courts, relief may be obtained. (*Western Union Tel. Co.* v. *Burlington etc. R. Co.*, 11 Fed. 1.) But: "Courts are and should be cautious in affording relief to a fraudulent debtor or other violator of the law under this exception, and should act only where it is evident that some greater public good can be subserved by action than by inaction." (*O'Connor* v. *Ward*, 60 Miss. 1025.)

Exception—One Party Guilty.—Where parties are not equally guilty and where it is in the interest of public policy to allow one of the parties to obtain relief from the transaction, the courts have granted relief. (*Logan County Nat. Bank* v. *Townsend*, 139 U. S. 67; *Duval* v. *Wellman*, 124 N. Y. 156.)

Exception—Object not Consummated.—Where the illegal purpose is not consummated, the agreement may be repudiated and the consideration paid thereunder recovered. (*Nat. Bank* v. *Carr*, 189 U. S. 426; *Fisher* v. *Hildreth*, 117 Mass. 558; *Donville* v. *Merrick*, 25 Wis. 688.)

INTERPRETATION OF CONTRACTS.—The courts in interpreting contracts apply broad principles to arrive at the intent of the parties. "The rules of interpretation ought not to be subtle; they are designed for people of common understanding; not as an act of logic but as the plain reason of a father of a family." (*Gathright* v. *Callaway County*, 10 Mo. 663.)

Intention of the Parties.—"The purpose of all interpretation is to ascertain and give effect to the intention of the parties to the contract as expressed by their writing." (*Alf. Bennett Lumber Co.* v. *Walnut Lake Cypress Co.*, 105 Ark. 421; also *Chesapeake etc. Canal Co.* v. *Hill*, 15 Wall. 94; *Smith* v. *Kerr*, 108 N. Y. 31; *Kluster* v. *Joseph Schlitz Brewing Co.*, 143 Wis. 347.)

Construction as a Whole.—The intention of the parties must be gathered from the entire contract, not a portion of it. (*Koles* v. *Borough Park Co.*, 142 App. Div. [N. Y.] 765.)

Separate Writings.—Where separate letters or instruments relate to one transaction or separate papers referred to, they will be read with reference to one another to interpret the contract. (*Pittsburgh etc. R. Co.* v. *Keokuk etc. Bridge Co.*, 155 U. S. 156; *Illinois Match Co.* v. *Chicago etc. R. Co.*, 250 Ill. 396; *Poel* v. *Brunswick-Balke-Collender Co.*, 216 N. Y. 310; *Hunt* v. *Frost*, 4 Cush. 54.)

Meaning of Words.—"The language employed is given its natural and commonly understood meaning." (*U. S. Fidelity etc. Co.* v. *French Mut. Gen. Soc.*, 212 Fed. 620.)

Technical Words.—Technical words will be interpreted in the sense in which they are generally used in the business to which the contract relates. (*Potter* v. *Phoenix Ins. Co.*, 63 Fed. 382.)

Writing and Printing.—Where both are used in a contract and are in conflict, the writing will prevail. (*United Surety Co.* v. *Summers*, 110 Md. 95.)

Words and Figures.—If in conflict, words govern. (*United Surety Co.* v. *Summers*, 110 Md. 95.)

Implied Terms.—In addition to words used, a contract also includes what is necessarily to be implied from the language used. (*Du Pont de Nemours Powder Co.* v. *Schlotterman*, 218 Fed. 353; *Senior* v. *Etger*, 213 N. Y. 589.)

Laws of the State.—The law of the state where the contract was made becomes part of it. (*Southern Surety Co.* v. *Oklahoma*, 241 U. S. 582; *People* v. *Metropolitan Surety Co.*, 211 N. Y. 107.)

Place.—"A contract as a rule is considered as entered into at the place where the offer was accepted (*Compagnie Générale etc.* v. *Simon Hertzig etc. Cie.*, 89 Misc. [N. Y.] 573; *In re Kahn*, 55 Minn. 509) or where the last act necessary to complete it is performed (*Clark* v. *Bell*, 223 Fed. 573).

Time.—If limited, the time runs from the date of the contract.

Ambiguous Contracts.—"If one interpretation of an ambiguous contract renders it valid and the other invalid, the former will govern. Likewise if one interpretation renders the contract reasonable and the other unreasonable the former will prevail."

Surrounding Circumstances Considered.—"The circumstances surrounding the parties when the contract was made form a sort of context that may be resorted to in doubtful cases to aid in arriving at the meaning of the contract." (*Singer* v. *Brenner*, 19 Pa. Dist.)

Liquidated Damages or Penalty.—Where a contract provides for the payment of a sum of money as liquidated damages in the event of a breach, whereas in fact the sum agreed upon is in the nature of a penalty, the courts will not enforce the contract. On the other hand, if the parties call it a penalty where it is in fact liquidated damages, the courts will interpret it as liquidated damages. (*War* v. *Building Co.*, 125 N. Y. 230.)

What Law Governs.—In general, the law of the place where the contract was made governs as to execution, authentication, and construction. As to performance, satisfaction, or discharge, the law of the place where the object of the contract is carried out governs. "As to mere personal contracts the law thereof as to their validity and interpretation, is that of the place where they were made; the *lex loci contractus*, unless the parties thereto intended that they should be governed by the law of the place of performance: the *lex loci solutionis*, or of some other place. That is, the place of the contract is, generally speaking, a matter of mutual intention, but the intended place, as determined by legal presumption in some cases and evidentiary circumstances in others, settles all questions as to the legal test of validity and interpretation. Such presumption, in the absence of evidence to the contrary, is that the place of making and performance, in a physical sense, is the place in a legal sense, but the place of performance when different from that of the actual making, is the place in such legal sense, subject to the presumption being rebutted by clear evidence of intention, this being again subject to some exceptions in case of intention to commit fraud on the law." (*International Harvester Co.* v. *McAdam*, 142 Wis. 114.)

DISCHARGE OF CONTRACTS.—Contracts may be discharged by

1. Performance
2. Agreement
3. Breach
4. Operation of law
5. Impossibility of performance

1. DISCHARGE BY PERFORMANCE.—In order that performance may discharge a contract, each party must have completed his part. In an executory contract performance by one discharges his obligations but not the contract. Where a promise is given for an executed consideration the performance of the promise discharges the contract.

Sufficiency of Performance.—Under the common law, performance must be strictly in accordance with the terms of the contract. The modern rule interprets sufficiency of performance to the effect that where one party has substantially completed his part he may recover his contract price less the amount the other party would have to pay for the completion of any minor, unintentional, and immaterial omission or deviation. This rule holds true, particularly in construction and building contracts. (*Heckmann* v. *Pinkney*, 81 N. Y. 211.)

Minor Unintentional Omissions and Deviations.—The courts construe minor, unintentional omissions and deviations as those that are "slight or susceptible of remedy, so that an allowance out of the contract price will give the other party substantially what he contracted for." (*Elliott* v. *Caldwell*, 43 Minn. 357.)

Time for Performance.—Where time is of the essence of a contract and so stated therein, it is strictly construed and the contract to be discharged by performance must be finished within the time limit. If completed after that time it is not performance and is not binding on the other party unless he waives the breach.

Satisfaction of One of the Parties.—Contracts which must be performed to the satisfaction of one of the parties can be discharged by performance only when the party is satisfied. Interpretation of such contracts depends on the subject matter. If it relates to personal tastes or judgment of one of the parties, he is the sole judge. The only requirement is that he be honest about his dissatisfaction.

2. DISCHARGE BY AGREEMENT.—Contracts may be discharged by mutual agreement. This may be done by

1. A new agreement to supersede the original one, or
2. The original contract may provide for discharge on the happening of a condition subsequent.

Such agreements must possess all the elements necessary to support a contract.

New Agreement.—This is in effect a new contract if expressly substituted for the old one, or where the new contract is inconsistent with the old one. In either case the original contract is discharged by agreement.

New Agreement—Novation.—Where a third person is brought into the substituted agreement to take the place of one of the original parties, with the consent of all three, the new substituted agreement is called a **novation.** The consideration of each party for the new contract consists of the creation of new rights and liabilities and the extinction of the old ones. (*Ford* v. *Adams*, 2 Barb. [N. Y.] 349.)

Contracts Which Cannot Be Discharged by Agreement.—Contracts for the benefit of third parties cannot be discharged by agreement of the original parties where the third party has been notified and has accepted it. To obtain the discharge of such contracts the consent of the third party is necessary.

3. DISCHARGE BY BREACH.—A breach of contract gives the injured party a right of action and generally discharges the contract. Such breach may be by

1. Failure of one of the parties to perform.
2. Refusal of one of the parties to perform.
3. One of the parties doing something which renders performance impossible.
4. Denial of the contract.

Failure to Perform.—To entitle a person to bring an action for failure to perform, he must have done all that can be done. Where time is of the essence, failure to complete within the time is a breach. If the contract is divisible, the failure to perform one part does not excuse the other party from performing the rest.

Refusal to Perform.—Refusal to perform by one party within the time for performance relieves the other party from further obligation, and he has the right to sue at once for the damages he has sustained.

Denial of Contract.—There must be an unqualified and definite renunciation, not a mere expression of intention not to perform. (*Drugiey* v. *Olen*, 117 U. S.)

4. DISCHARGE BY OPERATION OF LAW.—Contracts may be discharged by operation of law. This may be bankruptcy, alteration of the written instrument, or merger.

Bankruptcy.—Under the bankruptcy law the debtor is released of debts and liabilities provable under the statute where the bankrupt has obtained his discharge.

Alteration of Written Instrument.—Alteration means some erasure or addition which changes the meaning of the contract. It must relate to a material part and must have been intentionally made by one of the parties to the contract without the consent of the other party.

Merger.—The acceptance of a higher security for a lower one, where the parties are the same and the subject matter of the two securities is identical, results in the discharge of the original contract. This refers to cases where a judgment is recovered by one of the parties suing on a contract, or a sealed contract made by the parties covering the same transaction in an existing written instrument.

5. DISCHARGE BY IMPOSSIBILITY OF PERFORMANCE.—Impossibility of performance does not discharge a contract except where there is a legal impossibility or a physical inability in certain cases.

Legal Impossibility.—Where a statute enacted subsequent to the making of the contract renders the performance impossible without a violation of the law, the contract is discharged.

Physical Inability.—Destruction of the subject matter where the contract relates to a specific article or incapacity of the party where the contract was for personal service. discharges the contract on the ground of impossibility of performance.

Law of Corporations

DEFINITION.—"A corporation is an artificial person created by law for specific purposes, the limit of whose existence, powers and liberties is fixed by its charter." (Georgia Civil Code, 1831.) In a number of states corporations are defined by statute, similar to the one just given, which sets forth the essence of the many court decisions. For more comprehensive definitions see C. J. Baldwin, in *Mackay* v. *N. Y. etc. R. Co.*, 82 Conn. 73; *Chillicothe Bank* v. *Swayne*, 8 Ohio 257; *Dartmouth College* v. *Woodward*, 4 Wheat. (U. S.) 518.

In the last-mentioned case Chief Justice Marshall says: "A corporation is an artificial being, invisible, intangible and existing only in the contemplation of law. Being a mere creature of law, it possesses only those properties which the charter of its creation confers upon it, either expressly or as incidental to its very existence. These are such as are supposed best calculated to effect the object for which it was created. Among the most important are immortality, and, if the expression may be allowed, individuality; properties, by which a perpetual succession of many persons are considered the same, and may act as a single individual. They enable a corporation to manage its own affairs, and to hold property, without the perplexing intricacies, the hazardous and endless necessity of perpetual conveyances for the purpose of transmitting it from hand to hand. It is chiefly for the purpose of clothing bodies of men, in succession, with those qualities and capacities, that corporations were invented, and are in use. By these means, a perpetual succession of individuals are capable of acting for the promotion of the particular object, like one immortal being."

DISTINCTIVE FEATURES.—The most important distinctive attributes of corporations are separate legal entity and continuous existence. (*Liverpool etc. L. etc. Co.* v. *Olivia*, 10 Wall. 566; *People* v. *Coleman*, 133 N. Y. 279.)

AS A LEGAL ENTITY.—A corporation is a distinct legal entity, entirely separate from its members, with only such powers as are expressly or impliedly conferred on it by law. As an incident of such legal entity, it can hold property, contract, and sue as a natural person may. The corporate body can act only through its officers as agents whose acts are regarded as those of the legal entity as distinguished from its members. (*J. J. McGaskill Co.* v. *U. S.*, 216 U. S. 504; *Saranac etc. R. Co.* v. *Arnold*, 167 N. Y. 368; *Old Dom. Copper Min. etc. Co.* v. *Bigelow*, 203 Mass. 159.)

Corporation Distinct from Its Members.—"Every corporation is a person artificial, it is true, but nevertheless a distinct legal entity. Neither a portion nor all of the natural persons who compose a corporation, or who own its stock and control its affairs, are the corporation itself; and when a single individual composes a corporation he is not the corporation. In such case the man is one person created by the Almighty, and the corporation is another person created by law. It makes no difference in principle whether the sole owner of the stock of a corporation is a man or another corporation. The corporation owning such stock is as distinct from the corporation whose stock is so owned as the man is from the corporation of which he is the sole member." (*Macon Exchange Bank* v. *Macon Cons. Co.*, 97 Ga. 1.)

Property Rights.—A shareholder does not own a specific part of corporate property. "The money and property of a corporation belong to it and not to the individual members." (*Tomlinson* v. *Bricklayers' Union*, 87 Ind. 308.)

"The estate and rights of a corporation belong so completely to the body that none of the individuals who compose it have any rights of ownership in them, nor can they dispose of any part of them." (*Williamson* v. *Smoot*, 7 Mart [La.] 31.)

Debts, Torts and Legal Actions.—"A corporation and its shareholders are distinct legal entities. They are not responsible for the debts or the torts of the corporation. They cannot be parties in actions respecting corporate rights nor have they any title or direct interest in the property." (*Keith* v. *Clark*, 4 Lea [Tenn.] 718.)

Separate Corporations.—Two or more corporations are separate entities even though they are owned by the same stockholders. "The mere fact that the stockholders in two corporations are the same or that one corporation exercises a control over the other through ownership of its stock or through identity of its stockholders, does not make either the agent of the other, nor does it merge them into one, so as to make a contract of one binding on the other where each corporation is separately organized under a distinct charter. (*Martin Development Co. of America*, 240 Fed. 42; *New York Air Brake Co.* v. *Int. Steam Pump Co.*, 120 N. Y. Supp. 683.)

CONTINUOUS EXISTENCE.—The capacity of continuous succession whereby members elect or appoint their successors is a distinctive attribute of corporations although not necessary for corporate existence. A corporation has perpetual succession where its life is not limited by its charter or by statute. (*Dartmouth College* v. *Woodward*, 4 Wheat. [U. S.] 518; *Thomas* v. *Dakin*, 22 Wend. [N. Y.] 9.)

"The essence of a corporation is: (1) perpetual succession under a special name and in an artificial form; (2) the power to take and grant property, contract obligations, sue and be sued by its corporate name as an individual; and (3) to receive and enjoy in common grants of privileges and immunities." (*Thomas* v. *Dakin*, 22 Wend. [N. Y.] 9.)

CLASSIFICATION.—Corporations are of many kinds, all divided into various classes depending upon their nature. Textwriters have generally employed the following classification:

- CORPORATIONS SOLE
- CORPORATIONS AGGREGATE
  - Public
  - Quasi-Public
  - Private
    - Business
    - Ecclesiastical
    - Charitable

Corporations sole consist of a single individual. Such corporations are rare in America.

Corporations aggregate are composed of a number of individuals. Such corporations are divided into:

1. Public corporations, which are formed to promote public objects such as states, counties, municipalities, etc.

2. Quasi-public corporations, which are corporations organized by private individuals for private gain through the promotion of some public purpose, such as railroads, trolley lines, gas and electric companies. These are generally referred to as public service or public utility corporations.

3. Private corporations are those formed to promote and conduct private enterprises. Such corporations are divided into:

Business corporations
Ecclesiastical corporations
Charitable corporations

The foregoing classification is of interest from a historical point of view, but for practical purposes the classification under the New York statute, which in substance is the same in most states of the Union, is of greater value.

Classification under New York Statute.—

MUNICIPAL

STOCK
- Moneyed
- Transportation
- Business

NON-STOCK
- Religious
- Membership
  - Cemetery
  - Library
  - Co-operative
  - Board of Trade
  - Agricultural

A **municipal corporation** is a subdivision of the state established by law with powers of local government, such as town, cities, counties, etc.

A stock corporation is "a corporation having a capital stock divided into shares and which is authorized by law to distribute to holders thereof dividends or shares of the surplus profits of the corporation."

Non-stock corporations comprise all other corporations and include clubs, charitable institutions, and educational corporations.

A moneyed corporation is a stock corporation subject to the banking or insurance laws, and is formed under such laws. They include banks, insurance companies, trust companies, etc.

Transportation corporations are those stock corporations organized to conduct business as common carriers, such as railroads, canals, etc.

Business corporations are those stock corporations organized to carry on business in the usual commercial sense. "The term 'business corporation' generally means a corporation engaged in financial dealings, buying and selling, traffic, and mercantile transactions in general." (*Grenough* v. *Tiverton Police Com.*, 30 R. I. 212.)

DOMESTIC AND FOREIGN CORPORATIONS.—Corporations may also be classified according to the state or country under which they are organized. A domestic corporation is one that is within the jurisdiction of the state in which it was created. A corporation organized under the laws of the state of New York is a domestic corporation in New York State only, and if it goes into another state it is considered a foreign corporation of that state. Corporations created outside of the United States are designated as **alien corporations.**

CREATION OF CORPORATIONS.—

By Congress.—The Constitution of the United States does not give Congress direct authority to create corporations, but it may create corporations for the purpose of carrying out those powers expressly granted to it. "Whether or not Congress can create a corporation depends on the constitutionalty of the object to be attained. If a corporation is a means of attaining that object, the courts cannot inquire into it." (*McCullagh* v. *Maryland*, 4 Wheat. 316.)

By State Legislatures.—Business or stock corporations can only be created under authority of an act of the state legislature, which may prescribe the manner in which corporations may be formed. (*Briscoe* v. *Kentucky Bank*, 11 Pet. [U. S.] 257; *Boca-Mills Co.* v. *Curry*, 154 Cal. 326; *State* v. *Debenture Guarantee etc. Co.*, 51 La. Ann. 1874; *U. S. Trust Co.* v. *Brady*, 20 Barb. [N. Y.] 119.) The legislature cannot delegate that authority (*Southern Pacific R. Co.* v. *Orton*, 32 Fed. 457; *State Bank* v. *Hastings*, 1 Doug. [Mich.] 225; *People* v. *Dederick*, 161 N. Y. 195), nor can it grant corporate powers in conflict with the Constitution of the United States. (*Northern Securities Co.* v. *U. S.*, 193 U. S. 197.)

Under General Laws.—Business corporations are now generally created under the statutes of the several states, which are practically the same in general requirements. Substantial compliance with the statutes is necessary to bring the corporation into existence. (*Thompson* v. *People*, 23 Wend. 537; *Bigelow* v. *Gregory*, 73 Ill. 197.)

FORMATION.—The manner of organizing corporations under the statutes is practically the same in the different states, and consists of: (1) filing articles of incorporation, and (2) acceptance of charter.

ARTICLES OF INCORPORATION.—

Manner of Filing.—The certificate or articles of association must set forth the essentials required under the law, be signed and acknowledged by the incorporators, and presented to the designated officer of the state, usually the Secretary of State. This officer examines the articles as to form and substance and if approved grants the applicant a charter called the **certificate of incorporation,** which is recorded in his office, and a certified copy is filed in the county clerk's office where the corporation has its principal office.

Essentials.—The articles of incorporation must set forth the following requisites under the statute:

1. Name of corporation
2. Purpose
3. Capital stock
4. Location of principal office
5. Duration
6. Number of directors
7. Name and address of directors for first year (in some states)

Name of Corporation.—The name may be any one the incorporators desire to use, so long as it is not the same, or so nearly the same as to deceive, as that of any other domestic corporation or foreign corporation duly registered in the state. (*State* v. *Calios*, 150 Ala. 515; *Rhodes* v. *Piper*, 40 Ind. 369.)

Purpose.—The purpose, object, or business to be carried on by the corporation must be named with sufficient certainty to be reasonably clear and free from ambiguity. (*Utley* v. *Union Tool Co.*, 11 Gray [Mass.] 139; *People* v. *Beach*, 19 Hun [N. Y.] 259; *Atty. Gen.* v. *Lorman*, 59 Mich. 157; *Shick* v. *Citizens' Enterprise Co.*, 15 Ind. App. 329.) A corporation may be formed for any purpose not specifically forbidden by statute. (*Maxwell* v. *Akin*, 89 Fed. 178; *Market St. R. R. Co.* v. *Hellman*, 109 Cal. 571; *In re Southern Wisconsin Power Co.*, 140 Wis. 265.)

Capital Stock.—The amount of capital stock to be employed in the business as well as the kinds of shares must be stated in the charter or certificate. (*Byronville Creamery Assn.* v. *Ivers*, 93 Minn. 8.) Most states set a minimum capitalization, which in New York is $500; which state also requires that

one-half of the capital stock must be paid in within one year of the date of incorporation.

Number of Shares.—The number of shares into which the capital stock is divided together with the par value of each share, which may be fixed by the incorporators, must be set forth in the articles of incorporation. In New York and several other states there are restrictions as to the par value, which may not be less than, say, $5 or more than, say, $100. Stock without par value is permitted in some states.

Location of Principal Office.—The domicile of the corporation must be named in the articles of incorporation. The principal office must be within the state where it is incorporated. (*Meredith* v. *N. J. Zinc etc. Co.*, 59 N. J. Eq. 257; *Montgomery* v. *Forbes*, 148 Mass. 249; *Harris* v. *McGregor*, 29 Cal. 124.) This statutory requirement relates to the principal **corporate** office and does not necessarily mean the main business office.

Duration.—The life of the corporation may be for a term of years, or perpetual. Generally, if no time is set, it is perpetual; but in New York and several other jurisdictions this must be stated in the articles of incorporation.

Number of Directors.—The number of directors, generally not less than three, must in most states be set forth in the articles of incorporation.

Execution of Certificate.—The articles of incorporation must be signed and acknowledged by the incorporators (*State* v. *Beck*, 81 Ind. 500; *State* v. *Critchett*, 37 Minn. 13) who must have the qualifications prescribed by statute as to residence or citizenship (*People* v. *McDonough*, 60 N. Y. S. 45; *In re Chinese Club*, 1 Pa. Dist. 84) and as to number (*People* v. *Golden Gate Lodge* No. 6, 128 Cal. 257). Most states prescribe a minimum number of persons who may form a corporation. (*Montgomery* v. *Forbes*, 148 Mass. 249; *State* v. *Critchett*, 37 Minn. 13.)

QUALIFICATIONS.—Generally, any person capable of contracting and holding property in the state under whose laws a corporation is to be created may become an incorporator. "Legal infirmity in the parties is as fatal to the validity of an attempted corporate organization as is legal infirmity in the purpose of the organization." (*Am. Ball Bearing Co.* v. *Adams*, 222 Fed. 967.)

PAYMENT OF FEES AND TAXES.—One of the essentials for corporate existence in many states is the payment of certain taxes or fees fixed by statute. (*People* v. *Cook*, 47 Hun 467; *Atty. Gen.* v. *No. Pacific Ry. Co.*, 157 Wis. 73; *St. Louis Southwestern R. Co.* v. *Tod*, 94 Tex. 632.)

ACCEPTANCE OF CHARTER.—To bring a corporation into being an implied or express acceptance of the charter is necessary. (*Aspinwall* v. *Davies*, 22 How. [U. S.] 364; *Ellis* v. *Marshall*, 2 Mass. 269; *State* v. *Dawson*, 16 Ind. 40.) A corporation organized under general laws expressly accepts the charter generally at the first meeting of the stockholders, or impliedly accepts it by acting under it as a going concern. This acceptance must be in its entirety. The corporation cannot accept part and reject part. (*Rex* v. *Westwood*, 4 Barn. & Cress. 781.) When a corporation accepts a charter it is bound by it as well as by the general laws affecting such corporations.

BEGINNING OF CORPORATE EXISTENCE.—A corporation organized under general laws begins its corporate existence when the conditions prescribed by statute are complied with. (*Am. Ball Bearing Co.* v. *Adams*, 222 Fed. 967; *People* v. *Mackay*, 255 Ill. 144; *State* v. *Critchett*, 37 Minn. 13; *Jersey City Gas Co.* v. *Dwight*, 29 N. J. Eq. 242.) This is generally signified

by the Secretary of State accepting and recording the articles of incorporation, which when duly filed becomes the certificate of incorporation or the charter. Substantial compliance with the statute is sufficient. (*People* v. *Montecito Water Co.*, 97 Cal. 276; *Buffalo etc. R. Co.* v. *Hatch*, 20 N. Y. 157.)

Substantial Compliance.—The performance of the conditions necessary to effect incorporation are liberally construed by the courts. In *Hughes* v. *Antietam Mfg. Co.*, 34 Md. 316, the court said: "The policy of the law, as plainly indicated by the several provisions of the general corporation act, is to encourage the formation of these and other like companies, in order that not only the subscribers, but the public, may share the advantages, supposed to flow from combined capital and labor, and whilst the requirements of the law are to be fairly and substantially complied with, the rights and franchises of corporations and the interests of stockholders are not to be frittered away by technicalities, nor sacrificed to a strained construction of the statute."

CORPORATIONS DE JURE.—A corporation *de jure* is one created in accordance with all the provisions of the law. The charter of such a corporation is invulnerable to legal action even by the state itself. (*Flatwood Dist. Bd. of Education* v. *Berry*, 62 W. Va. 433; see also 24 L. R. A. 259.)

CORPORATION DE FACTO.—A corporation *de facto* is a corporation whose creation was irregular and not in full compliance with the law. The legality of such a corporation can be attacked only by the state and cannot be attacked collaterally. The elements necessary to classify a corporation as *de facto* are: (1) a general law under which a *de jure* corporation could be organized; (2) an attempt to organize under the law and to comply with the statutory requirements; (3) exercise of corporate powers under such an attempted organization. (*Yaques* v. *Yuba County*, 24 Cal. App. 381; *Mackay* v. *N. Y. etc. R. Co.*, 82 Conn. 73; *Imperial Bldg. Co.* v. *Chicago Board of Trade*, 238 Ill. 100; *Von Langerke* v. *N. Y.*, 150 App. Div. [N. Y.] 98; *Utah Light etc. Co.* v. *U. S.*, 230 Fed. 343; *Healey* v. *Steele Center Creamery Assn.*, 115 Minn. 451.) "A corporation *de facto* is not a corporation legally constituted, but a corporation organized and operated under color of the law." (*Am. Salt Co.* v. *Heidenheimer*, 80 Tex. 344.)

Stockholders' Liability.—The incorporators as stockholders of a *de facto* corporation, in the absence of fraud, are not personally liable in a collateral attack by creditors for the debts of a corporation. (*Brown* v. *Melick*, 185 Ill. App. 3; *Richards* v. *Minn. Savings Bank*, 75 Minn. 196; *Stout* v. *Zulick*, 48 N. J. L. 599.)

PRETENDED CORPORATIONS—LIABILITY ON.—Persons holding themselves out as a corporation when in fact there is none, either *de jure* or *de facto*, are liable individually or as partners on contracts entered by them or by their agents as agents of the pretended corporation. (*Harrill* v. *Davis*, 168 Fed. 187; *Cord* v. *Moor*, 68 App. Div. [aff. 173 N. Y. 598]; *Slocum* v. *Heod*, 105 Wis. 431; *Campbell* v. *J. L. Campbell Co.*, 117 La. 402; *Montgomery* v. *Forbes*, 148 Mass. 249.)

CORPORATE POWERS.—

General Powers.—"The charter of a corporation read in connection with the general laws applicable to it, is the measure of its powers, and a contract manifestly beyond those powers will not sustain an action against the corporation. But whatever under the charter and general laws, reasonably construed, may fairly be regarded as incidental to the object for which the corporation is created is not to be taken as prohibited." (*Green Bay etc. Ry. Co.* v. *Union etc. Co.*, 107 U. S. 98.)

Implied Powers.—These consist of anything reasonably necessary to carry out its express corporate powers, and may consist of power to:

1. Make contracts. (*White Water etc. Co.* v. *Vallette*, 21 How. 414.)
2. Purchase and sell personal property.
3. Borrow money. (*Wright* v. *Hughes*, 119 Ind. 324.)
4. Issue and accept commercial paper required in its business but not for accommodation. (*Grommes* v. *Sullivan*, 81 Fed. 45.)
5. Make by-laws. (*Ireland* v. *Globe etc. Co.*, 19 R. I. 180.)

ULTRA VIRES CONTRACTS.—"The contracts of corporations are said to be *ultra vires* when they involve some adventure or undertaking not within the scope of their charter, which is the rule of corporate action." (*Leslie* v. *Lorillard*, 110 N. Y. 519.)

Executory Ultra Vires Contracts are Void.—If the *ultra vires* contract is executory, i.e., if neither party has performed its part, the contract is void and unenforcible. (*Central Trans. Co.* v. *Pullman etc. Co.*, 139 U. S. 24; *Northwestern etc. Co.* v. *Shaw*, 37 Wis. 655.)

Partly Performed Ultra Vires Contract—Decisions in Conflict.—The rule followed by the **U. S. Supreme Court, Massachusetts, Alabama,** and a few other states, is that an *ultra vires* contract is void, and the courts refuse to enforce performance by the party in default. (Rule followed in U. S. Supreme Court, Ala., Ill., Me., Mass., Tenn., Vt., and in England.)

The rule followed by **most states** is that where an *ultra vires* contract is performed by one side the other party is estopped from setting up the defence of *ultra vires*. (Rule followed in New York and all the other states of United States except those named.)

Executed Ultra Vires Contracts.—If an *ultra vires* contract is fully executed by both sides, neither party can avail himself of the defense of *ultra vires*. (*Merchants Nat. Bank* v. *Wehrmann*, 202 U. S. 295.)

CAPITAL STOCK DEFINED.—The capital stock of a corporation is the amount of stock a corporation is authorized to issue by its charter. (*Powers* v. *Detroit etc. R. R. Co.*, 201 U. S. 543; *Christensen* v. *Eno*, 106 N. Y. 97.) This amount can be increased or diminished only by amendment of its charter in the prescribed statutory manner. (*Scovill* v. *Thayer*, 105 U. S. 143; *Schenck* v. *Andrew*, 46 N. Y. 589.)

Capital and Capital Stock Differentiated.—The capital of a corporation is the sum total of all its assets less its liabilities, whereas capital stock is the amount of stock authorized. "The funds of the company may fluctuate. Its capital stock remains invariable, save by legislative enactment. This distinction between the value of the property of incorporated companies and their capital stock is perfectly familiar." (*The State* v. *Morristown Fire Assn.*, 23 N. J. L. 195.)

ISSUED STOCK.—Issued stock is stock issued by the corporation for value of stock for which the company has accepted a subscription so as to give the subscriber title to it.

UNISSUED STOCK.—Represents that part of its authorized capital stock which has not been issued. It is not an asset of the corporation but is merely a right which can be exercised in the issue of stock for money or property.

OVERISSUED STOCK.—Such stock is void as it is beyond the power of the corporation to issue it and can in no way be validated. (*Scovill* v.

Thayer, 105 U. S. 143; *Olson* v. *State Bank*, 67 Minn. 267; *New York etc. R. Co.* v. *Schuyler*, 34 N. Y. 30.)

TREASURY STOCK.—Treasury stock is stock lawfully issued by the company for money, services, or property, and reacquired by purchase or donation. The company may sell such stock at any price and on any terms it may deem proper. (*Lake Superior Iron Co.* v. *Drexel*, 90 N. Y. 87; *Pullman* v. *Ry. Equipment Co.*, 73 Ill. App. 313.) Sale below par will not subject the purchaser to liability for the unpaid balance. Such stock is generally used for the purpose of raising working capital. (*Quinn* v. *Whitney*, 204 N. Y. 363.) "Treasury stock is stock which is returned by the person to whom it is issued to the corporation as a gift to sell the same and put the proceeds in the corporation treasury as working capital." (*Newman* v. *Sexton*, 156 Ill. App. 517.)

FULL-PAID STOCK.—This is stock paid for in full on which there is nothing due to the corporation. (*Johnson* v. *Nat. Bldg. etc. Assn.*, 125 Ala. 465.)

WATERED STOCK.—This is stock issued as full-paid stock in payment of property at inflated or fictitious values, or issued in any form in excess of the value received for it.

INCREASE OR DECREASE OF CAPITAL STOCK.—The capital stock of a corporation may be increased or decreased subsequent to organization by following the statutory procedure, which generally consists of:

1. Obtaining unanimous consent of stockholders in writing, or
2. By vote of a majority of the stock at a meeting duly called for that purpose, and
3. Filing certificate of the amount of increase or decrease with the Secretary of State and county clerk where the corporation has its principal office.

In decreasing the capital stock the consent of the State Comptroller is necessary. The capital stock cannot be decreased below the amount of the liabilities of the corporation. The state laws should be consulted on this point.

Stockholders' Rights to Increased Stock.—The existing stockholders of a corporation have a pre-emptive right to purchase proportional shares of a subsequent issue of increased stock. (*Bacon* v. *Gross*, 165 Cal. 481; *Erdman* v. *Bowman*, 58 Ill. 444; *Luther* v. *C. T. Luther Co.*, 118 Wis. 112.)

Increase in Number of Shares and Par Value.—The par value or the number of shares of a corporation can neither be increased nor decreased unless expressly authorized by the charter or by the legislature. (*Scovill* v. *Thayer*, 105 U. S. 148; *Fall River Gas Works Co.* v. *Board of Gas etc. Com.*, 214 Mass. 529; *Einstein* v. *Rochester Gas etc. Co.*, 146 N. Y. 46; *State* v. *No. Pacific R. Co.*, 157 Wis. 73.) The procedure is similar to that required to increase stock mentioned above.

COMMON STOCK.—Differs in one or more ways from what is termed preferred stock. The owner of common stock is entitled to an equal pro rata division of the profits, if there be any, but has no advantage over any other shareholder or class of shareholders of common stock.

PREFERRED STOCK.—On the other hand, preferred stock generally entitles its owner to dividends out of the net profits before, and in preference of, the holders of the common stock. "Generally the rights, powers and

privileges of preferred stockholders depend upon terms upon which it is issued; preferred stock taking a multiplicity of forms according to the desire or ingenuity of the stockholders, and the necessity of the corporation itself." (*Storrow* v. *Texas Cons. Compress etc. Assn.*, 87 Fed. 612.)

The preference of preferred stock may consist of: (1) preference as to dividends only; (2) preference as to assets on liquidation. Unless so stated when issued or on the certificate, preferred and common stock share alike in distribution of assets on dissolution.

ORIGINAL ISSUE.—

For Value.—Stock must be issued for value, which may be money, labor, services, or property, and which may be either tangible or intangible, such as good-will, copyrights, etc. (*In re Manufactured Box etc. Co.*, 251 Fed. 957; *Nat. Tube Works Co.* v. *Gilfillan*, 124 N. Y. 302; *Gillett* v. *Chicago Title Co.*, 230 Ill. 373.)

For Less Than Par.—Some states prohibit the original issue of stock by a corporation for less than par, while in others a corporation may issue and sell its stock in good faith at less than par. (*Dickerman* v. *No. Trust Co.*, 176 U. S. 181; *O'Dea* v. *Hollywood Cemetery Assn.*, 154 Cal. 53; *Goodnow* v. *Am. Writing Paper Co.*, 72 N. J. Eq. 645.)

"The rule seems to be established that between stockholders one cannot legally be called upon to make good any shortage in value between assets and the nominal value of the stock, when his stock is issued under a contract with the company as full paid, whether as a bonus or for property at an over-valuation when the issue is consented to by all the stockholders. It is a bargain between the contracting parties, which, in the absence of fraud, they cannot abrogate. They may let in one to participate in dividends, and thus reduce what they would have on that account, and decrease their share of its assets on final distribution; but they are dealing with their own property, and so long as they do not divide any part of the paid in capital they may contract to apportion dividends, property payable, and also the assets, among as many as they may choose, subject to the rights of creditors." (*Goodnow* v. *Am. Writing Paper Co.*, 72 N. J. Eq. 645.)

As stated, such unpaid stock, in case of insolvency would be liable for the amount unpaid.

STOCK CERTIFICATE ISSUED BY OFFICER.—Certificates of stock issued by an officer or agent clothed with authority to issue genuine certificates, are binding on the corporation even though the officer may have exceeded his authority or issued certificates fraudulently or for his personal benefit. (*Jarvis* v. *Manhattan Beach Co.*, 148 N. Y. 652.) "The ground of liability is not that the principal has been benefited by the act of the agent, but that an innocent third person has been damaged by confiding in the agent who was accredited by the principal as worthy of trust, in that particular business." (*Tome* v. *Parkersburg Branch R. Co.*, 39 Md. 39.)

Forged Stock Certificate.—A corporation, in the absence of negligence, is not liable for a certificate forged by an officer or employer. (*Hill* v. *C. T. Jewett Pub. Co.*, 154 Mass. 172.)

SHARES OF STOCK.—"A share of the capital stock is the right to partake, according to the amount put into the fund, of the surplus profits of the corporation; and ultimately on dissolution of it, of so much of the fund thus created, as remains unimpaired, and is not liable for the debts of the corporation." (*Burral* v. *Bushwick Ry. Co.*, 75 N. Y. 211.) The written evidence is through a paper issued by the corporation called a stock cer-

tificate. "Each share represents an aliquot part of the capital stock." (*Farrington* v. *Tennessee*, 95 U. S. 679.)

Capital Stock and Shares of Stock Differentiated.—These are distinct from each other. Capital stock belongs to the corporation as a legal person, whereas the shares of stock are the property of the stockholder according to their holdings. (*People* v. *Dederick*, 161 N. Y. 195; *Warner* v. *Brown*, 121 N. E. 69; *Kohl* v. *Lilienthal*, 81 Cal. 378.)

CERTIFICATE OF STOCK.—A certificate of stock is not the stock itself but merely written evidence of the contract between the corporation and the holder named therein. This contract entitles the holder to share in the corporate management, surplus profits, and, on dissolution, in the surplus after paying all corporate debts. (*Gibbons* v. *Mahon*, 126 U. S. 549; *Daly* v. *People's Bldg. etc. Assn.*, 172 Mass. 533; *U. S. Radiator Corp.* v. *State*, 208 N. Y. 144; *Richardson* v. *Shaw*, 209 U. S. 365; *Cortelyou* v. *Imperial Land* Co., 156 Cal. 373.)

Certificates of Stock Are Personal Property.—The shares or certificates of stock are personal property regardless of whether the property of the corporation is realty or personalty. (*Jellenik* v. *Huron Copper Min. Co.*, 177 U. S. 1; *Weaver* v. *Bardon*, 49 N. Y. 286; *Chesebrough* v. *San Francisco*, 153 Cal. 559.) Being regarded as personal property, certificates of stock may be disposed of as the owner may see fit, by sale, gift, etc. (*Farmers L. & T. Co.* v. *Chicago etc. R. Co.*, 163 U. S. 31; *McGue* v. *Rommel*, 148 Cal. 539; *Roosevelt* v. *Hamblin*, 199 Mass. 127; *Ingraham* v. *Nat. Salt Co.*, 72 App. Div [N. Y.] 582; *In re Klaus*, 67 Wis. 401.)

Negotiability.—Certificates of stock are not negotiable instruments either in form or character. (*Hammond* v. *Hastings*, 134 U. S. 401; *Perkins* v. *Cowles*, 157 Cal. 625; *Barstow* v. *City Trust Co.*, 216 Mass. 330; *Knox* v. *Eden Musee Americain Co.*, 148 N. Y. 44.) "They do not run to bearer or to the order of the person to whom they are given. They simply declare that the person named in the certificate is entitled to a certain number of shares of stock." (*Oxford* v. *West. Syndicate Inv. Co.*, 170 N. W. 587.)

Transfer.—The owner of shares may transfer them by assignment in any manner sufficient to pass title to a chose in action. Assignment accompanied by delivery is sufficient to pass title. A transfer on the books of the company is not necessary unless prescribed by statute or charter. (*Ellis* v. *Essex Merrimack Bridge Proprietors*, 2 Pick. 243; *Lockwood* v. *Brantly*, 103 N. Y. 680.)

Effect of Transfer.—Transfer gives the transferee all the right held by the transferor as a stockholder. (*Manhattan Beach Co.* v. *Harned*, 27 Fed. 484; *Roosevelt* v. *Hamblin*, 199 Mass. 127.)

Pledge of Share.—Shares of stock may be pledged as collateral security and will be subject to the general laws governing pledges, in that title remains in the pledgor subject to the pledgee's lien until redeemed or sold under foreclosure. (*Germania Nat. Bank* v. *Case*, 991 U. S. 628; *Markham* v. *Jaudon*, 41 N. Y. 235; *Badwin* v. *Canfield*, 26 Minn. 43.)

NET PROFITS DEFINED.—"What is left after paying current expenses and interest on debts and everything else which the stockholders, preferred and common as a body corporate are liable to pay." (*Warren* v. *King*, 108 U. S. 389.)

DIVIDENDS DEFINED.—"Such a portion of accumulated net earnings, or surplus, as the directors of a corporation may deem expedient to be distributed, and in appropriate proceedings is by them ordered to be distributed

among those entitled by law to receive it; is *ex vi termini* the part of a thing which has been set apart for distribution." (*U. S. Life Ins. Co.* v. *Spinks*, 29 Ky. L. 960.)

Dividends Paid out of Profits.—Dividends can be declared and paid only out of net profits and surplus. (*Mobile etc. R. Co.* v. *Tennessee*, 153 U. S. 486; *Roberts* v. *Roberts-Wicks Co.*, 184 N. Y. 257.) "The general rule, even in the absence of any statute on the subject, is that dividends, in a going concern, can be properly declared and paid only out of profits, and not out of capital or assets required for the security and payment of creditors." (*Davenport* v. *Luries*, 72 Conn. 118.)

Rights to Dividends.—"Stockholders have no claim to a dividend until it is declared. Until that time it belongs to the corporation, precisely as any other property." (*Goodwin* v. *Hardy*, 57 Me. 143.) "Money earned by the corporation remains the property of the corporation, and does not become the property of the stockholders, unless and until it is distributed among them by the corporation." (*Gibbons* v. *Mabon*, 136 U. S. 549.) "A right to a dividend from profits of a corporation is no debt until the dividend is declared." (*Lockhart* v. *Van Alstyne*, 31 Mich. 75.)

Declared by Directors.—The board of directors legally sitting as a board have authority to declare dividends and fix the time, place, and manner of payment. (*King* v. *Paterson etc. R. Co.*, 29 N. J. L. 82.)

Property of Stockholders.—When so voted and due notice given to the public, dividends so declared become a vested right of, and are the property of, the stockholders. (*Ford* v. *East Hampton Co.*, 158 Mass. 84.)

Debt of Corporation—Date.—Dividends belong to stockholders at the time they were declared; if made payable at a later date and shares transferred in the meantime, the dividend belongs to the shareholder on the day they were declared. (*Hopper* v. *Sayre*, 112 N. Y. 530; *Wheeler* v. *Northwestern Co.*, 39 Fed. 347.)

Stock Dividends.—Corporations having an accumulated surplus invested in property necessary to operate the business may find it inexpedient to distribute such surplus as a cash or property dividend. They may, however, declare a stock dividend which is paid by the issue of capital stock. (*Williams* v. *Western Union Tel. Co.*, 93 N. Y. 162.)

The corporation should first obtain permission to increase its capital stock, unless it has a sufficient amount authorized but not yet issued, and then declare a dividend payable in its capital stock up to the amount of its accumulated surplus. The operation results in capitalizing surplus.

MANAGEMENT AND OPERATION—1. DIRECTORS.—The board of directors, as agents of the stockholders, are responsible for the management of the corporation. Directors are elected by the stockholders on a majority vote at the first and at such meetings thereafter as prescribed by the charter or by-laws.

Qualification.—Most states provide by statute that directors shall be stockholders, but "In the absence of a statute requiring it, the discretion of the stockholders in electing directors is not limited to persons holding stock.' (*State* v. *McDaniel*, 22 Ohio St. 307; *Beardsley* v. *Johnson*, 121 N. Y. 224.)

Powers.—"Within the chartered authority they have the fullest power to regulate the concerns of a corporation according to their best judgment, and contracts which the corporation could legitimately make come within the scope of the ordinary powers of corporate management." (*Beveridge* v. *N. Y. El. Ry. Co.*, 112 N. Y. 1.)

Responsibilities.—Are of a fiduciary nature. "The duties of directors are of the most responsible kind, and it is the purview of the law that they should be held to a strict accountability for their acts to the stockholders, towards whom they occupy the relation of trustees, with all which that term implies of power and responsibility." (*Beveridge* v. *N. Y. El. Ry. Co.*, 112 N. Y. 1.) (A comprehensive summary of the relation of directors to the corporation is set forth in *Bosworth* v. *Allen*, 55 L. R. A. 751, a leading case frequently cited.)

Directors are expected **to use reasonable care,** diligence, and skill in the discharge of their duties. (*Hun* v. *Cary*, 82 N. Y. 65; *Thompson* v. *Greely*, 107 Mo. 577.) At least such as would be used by an ordinarily careful man in his own personal business. (*Ackerman* v. *Halsey*, 38 N. J. Eq. 501; *Corn Bank* v. *Chatfield*, 121 Mich. 641.)

Negligence.—Directors are not liable for mistakes of judgment unless there was such gross carelessness that an ordinarily prudent man would not have done so or if bad faith were shown. (*Hun* v. *Cary*, 82 N. Y. 65.)

What Directors Cannot Do.—There are certain acts which belong to the stockholders as a body which are not delegated to their directors, among which are:

1. Dissolve the corporation unless authorized by the stockholders to do so.
2. Apply for or accept amendments to the charter.
3. Increase or decrease the capital stock.
4. Consolidate with another corporation.
5. Change by-laws.
6. Sell out or dispose of the corporate property so as to virtually put it out of business. (*Metropolitan El. Ry. Co.* v. *Manhattan El. Ry. Co.*, 11 Daly [N. Y.] 373.)

Directors' Contracts with Their Corporation.—In view of the conflict of decisions on this important subject the various views are given.

1. That such contracts are void as against public policy. The director, by reason of his fiduciary capacity, is precluded from entering on a contract in which his personal interests are in conflict with those of the corporation. (*Wilbur* v. *Lynde*, 49 Cal. 290; *Post* v. *Russell*, 36 Ind. 65; *Gardner* v. *Butler*, 30 N. J., Eq. 702; *Coleman* v. *Second Ave. R. Co.*, 38 N. Y. 201; *Haywood* v. *Lincoln Lumber Co.*, 64 Wis. 647.)
2. That such contracts are not void *per se*, but voidable by the corporation if the right is exercised within a reasonable time. (*Thomas* v. *Brownville etc. R. Co.*, 109 U. S. 522; *Hill* v. *Nisbet*, 100 Ind. 353; *Kelly* v. *Newburyport etc. R. Co.*, 141 Mass. 499; *Stewart* v. *L. V. R. R. Co.*, 38 N. J. L. 505; *Munson* v. *Syracuse etc. R. Co.*, 103 N. Y. 58.)
3. Such contracts when fair and entered into in good faith are valid, but subject to careful scrutiny by the courts. (*Pneumatic Gas Co.* v. *Berry*, 113 U. S. 322; *Gamble* v. *Queens Co. Water Co.*, 123 N. Y. 91; *Putnam* v. *Rubicon*, 32 Wis. 498.)

The tendency seems to be that the courts of most states are interpreting directors' contracts, wherever possible, in accordance with the third view.

Liability of Directors—To Creditors.—Directors are not personally liable to creditors for mismanagement of a business and subsequent loss to creditors unless there is fraud or such gross negligence as to amount to fraud. (*Saranac etc. Ry. Co.* v. *Arnold*, 41 App. Div. [N. Y.] 482; *Vose* v. *Grant*, 15 Mass. 505.)

To File Reports.—Most states require corporations to file reports of various kinds for several purposes, such as financial reports for tax purposes. In case of failure to file such reports, the officers or directors are usually subject to penalty. The statutes are strictly construed and to release the officers or directors from liability strict adherence to the statutory requirements is obligatory. (*Shanklin* v. *Gray*, 111 Cal. 88; *President etc. Manhattan Co.* v. *Kaldenberg*, 165 N. Y. 1.)

Removal of Directors.—Directors cannot be removed from office unless such power is provided in the statutes, the charter, or by-laws, and then only for the causes enumerated therein. Generally the causes for removal are negligence, misconduct in office, or "other reasonable cause." What is "reasonable cause" is for the stockholders to determine, and in the absence of direct fraud their decision cannot be interfered with. (*Re: The A. A. Griffing Iron Co.*, 63 N. J. L. 168. See Morawetz, § 542.)

2. OFFICERS.—

Appointment and Duties.—Usually the by-laws provide for the manner in which officers shall be appointed and also prescribe their duties. Directors usually elect officers, fix their salaries, and prescribe their duties where they are not set forth in the by-laws.

Powers.—Corporate officers are agents and are governed in general by the law of agency. They have only such powers as are conferred on them. Persons dealing with agents or officers of a corporation are chargeable with knowledge of the extent of authority of such officers. Where, however, an officer acts for a corporation for a considerable length of time, though in fact he has no authority to act as such officer or has continuously acted beyond his authority, the corporation is nevertheless bound by his acts on the principle of estoppel. (*Com. Mutual etc. Ins. Co.* v. *Union etc. Ins. Co.*, 10 How. [U. S.] 322; *Ashby Wire Co.* v. *Ill. Steel Co.*, 164 Ill. 147.)

Liabilities for False Representation.—Officers and directors are liable for false statements of material facts made with intent to deceive, such as representation as to solvency on which third parties relied and suffered damage as a consequence. (*Bank of Montreal* v. *Thayer*, 2 McCrary [U. S.]; *Morgan* v. *Skiddy*, 62 N. Y. 319.)

The President.—"In the absence of legislative enactment or provisions made in the by-laws, corporations usually act through their president, or those representing him. He being the legal head of the body, when an act is performed by him the presumption will be indulged that the act is legally done; and is binding upon the body; and, as a general rule, in the absence of the president, or when a vacancy occurs in office, the vice-president may act in his stead, and perform the duties which devolve upon the president." (*Smith* v. *Smith*, 62 Ill. 493.)

Other Officers.—Other officers are one or more vice-presidents, a secretary, and a treasurer, whose duties are such as are generally understood to belong to such officers or are prescribed for them.

STOCKHOLDERS' RIGHTS AND LIABILITIES.—

Relation.—"The relation between a corporation and its stockholders is essentially contractual. The charter is the embodiment of the contract." (*Hyams* v. *Old Dominion Co.* 113 Me. 294; *Jones* v. *Mo. Edison Elec. Co.*, 144 Fed. 153; *People's Mutual Ins. Co.* v. *Westcott*, 14 Gray [Mass.] 440.)

Rights of Stockholders.—

1. To attend and vote at corporate meetings.
2. Elect directors.

3. Participate in dividends or profits.
4. Share in corporate assets on dissolution.
5. Inspect corporate books.

Meetings of Stockholders.—Stockholders exercise their corporate functions at duly called meetings. (*In re Butler*, 207 Fed. 705; *Marlborough Mfg. Co.* v. *Smith*, 2 Conn. 579.) These are generally the annual meetings of stockholders, which must be held in the state wherein the corporation was incorporated unless permitted to be held elsewhere by the laws of that state.

Voting.—The right to vote is incidental to stock ownership conferred by statute or charter and cannot be limited or retained by the by-laws. Only stockholders of record are entitled to vote (*MacNeil* v. *Tenth Nat. Bank*, 46 N. Y. 325), and voting may be done in person or by proxy. One vote for each share is the rule in stock corporations. One vote for each member, in membership corporations.

A **proxy** is a power of attorney authorizing another person to attend a stockholders' meeting in his place and vote his stock. A proxy may be revoked at any time unless coupled with an interest.

Cumulative Voting.—By cumulative voting a minority of shareholders can obtain representation on a board of directors by accumulating their votes on one or a few candidates. By this method each stockholder has as many votes as he has shares multiplied by the number of directors to be elected. A stockholder may cast all his votes for one or more candidates as he sees fit. A minority, by confining their votes to one or a few, may obtain representation on the board.

Stockholders have the right to cumulative voting only if given to them under the statutes, charter, or by-laws of the corporation. It is not an inherent right of stock ownership. (*State* v. *Stockly*, 45 Ohio St. 304; *Lowenthal* v. *Rubber etc. Co.*, 52 N. J. Eq. 440.)

Quorum.—What constitutes a quorum at a meeting of stockholders is generally prescribed by the by-laws, and as a rule is a majority of stock outstanding. A majority of a quorum has power to decide questions brought before the meeting, which in turn is binding on the corporation.

Rights to Information.—The stockholders have a right to information regarding the business and affairs of the corporation. This is generally furnished in the reports of the officers and directors given at the annual meetings. (*Weir* v. *Bay State Gas Co.*, 91 Fed. 940; *Richmond* v. *Hill*, 148 Ill. App. 179.)

Right to Inspect Corporate Records.—A stockholder has a right to inspect corporate records and books for proper purposes and at proper times. (*Guthrie* v. *Harkness*, 199 U. S. 148; *Hobbs* v. *Tom Reed Gold Min. Co.*, 164 Cal. 497; *Klotz* v. *Pan. Am. Match Co.*, 221 Mass. 38; *Tuttle* v. *Iron Nat. Bank*, 170 N. Y. 9.) "The right of inspection of the books and records of a corporation at reasonable times and for proper purposes is a common law privilege incident to the ownership of shares in a corporation." (*State* v *Middlesex Banking Co.*, 87 Conn. 483.)

"The right to examine books of a corporation is purely a personal right depending upon the ownership of capital stock of the corporation." (*In re Hastings*, 170 App. Div. [N. Y.] 756.) At common law the right covered the financial as well as the corporate books, and in some states the same rights are covered by statute. But in most jurisdictions the right is limited to the corporate books disclosing stock ownership, generally the transfer books and stock ledger.

PROMOTER OF CORPORATIONS.—

Promoter Defined.—"In a comprehensive sense 'promoter' includes those who undertake to form a corporation and to procure for it the rights instrumentalities and capital by which it is to carry out the purposes set forth in its charter, and to establish it as fully able to do its business. Their work may begin long before the organization of the corporation, in seeking the opening for a venture and projecting a plan for its development, and may continue after the incorporation by attracting the investment of capital in its securities and providing it with the commercial breath of life." (*Old Dom. Copper Min. etc. Co.* v. *Bigelow*, 203 Mass. 159.)

Nature of the Relation.—Not agency. "A promoter, though he purport to act on behalf of the projected corporation, and not for himself, cannot be treated as agent, because the nominal principal is not then in existence." (*Weatherford etc. R. Co.* v. *Granger*, 86 Tex. 350.)

Fiduciary Relation.—Promoters hold a fiduciary relation to the subscribers and to the corporation. (*Dickerman* v. *No. Trust Co.*, 176 U. S. 182; *Old Dom. Copper Min. etc. Co.* v. *Bigelow*, 203 Mass. 159; *Brewster* v. *Hatch*, 122 N. Y. 349; *Pietsch* v. *Milbrath*, 123 Wis. 647; *Burbank* v. *Dennis*, 101 Cal. 90.) "This trust relationship is necessarily twofold: towards the corporation, as a separate legal entity in respect to corporate property, and towards the shareholder, in respect to his property right in his shares." (*Wills* v. *Nehalem Coal Co.*, 52 Or. 70.)

Contracts of Promoters.—The general and well-settled rule is that contracts made by promoters are not binding on the corporation when formed (*In re Ballou*, 215 Fed. 810; *Peek* v. *Steinberg*, 163 Cal. 127; *Hladover* v. *Paul*, 222 Ill. 254; *Munson* v. *Syracuse etc. R. Co.*, 103 N. Y. 58; *McArthur* v. *Times Printing Co.*, 48 Minn. 319) unless it is made so by statute, article of incorporation, or adopted and ratified by the corporation when it comes into existence (*Whitney* v. *Wyman*, 101 U. S. 392; *Forbes* v. *Thorpe*, 209 Mass. 570; *Wintner* v. *Rosemont Realty Co.*, 101 App. Div. [N. Y.] 90). This rule applies even though the promoter makes contracts for and in the name of the proposed corporation.

DISSOLUTION.—Corporations are dissolved and their corporate existence ceases by:

1. Voluntary dissolution
2. Expiration of charter
3. Breach of corporation laws
4. Bankruptcy (See section on "Bankruptcy, Insolvency, and Receivership")

Voluntary Dissolution.—In a number of states the statutes provide for the voluntary dissolution of corporations. These statutes must be strictly complied with. (*Hening* v. *N. Y. etc. R. Co.*, 105 N. Y. 340.)

The primary requisites are: (1) Consent of the state which granted the charter; (2) Consent of a majority of the stockholders voted at a duly constituted meeting called for that purpose.

A corporation continues its corporate existence until formal consent to dissolve is obtained from the state, even though it has assigned or abandoned its property and powers generally. (*Boston Glass Co.* v. *Langdon*, 24 Pick. [Mass.] 49; *Wyeth Co.* v. *James Co.*, 15 Utah 110; *Packard* v. *Old Colony Ry. Co.*, 168 Mass. 92.)

Expiration of Charter.—A corporation with a prescribed number of years' life dissolves, *ipso facto*, at the expiration of the time limited to its corporate existence. No formal action is required by either the state or the company. (*People* v. *Anderson etc. Co.*, 76 Cal. 190; *Sturges* v. *Vanderbilt*, 73 N. Y. 384.)

Breach of Corporation Laws.—A corporation may be dissolved by the state for misuse (*People* v. *North River Sugar Ref. Co.*, 121 N. Y. 582; *Mumma* v. *Potomac Co.*, 8 Pet. [33 U. S.] 281), or non-use of corporate power. Most states have laws which provide that if a corporation does not organize and transact business under its charter within a prescribed length of time, generally one or two years, its corporate powers shall cease.

Law of Negotiable Instruments

DEFINITION.—"An instrument is called negotiable when the legal title to the instrument itself, and the whole amount of money expressed upon its face, may be transferred from one to another by indorsement and delivered by the holder or by delivery only." (Daniels on Negotiable Instruments.)

DISTINCTIVE CHARACTERISTICS.—Although negotiable instruments are contracts in a broad sense of the word, they possess two distinctive characteristics wherein they differ from ordinary contracts. These are negotiability and the presumption of consideration.

Negotiability.—Negotiability is that quality whereby, (1) the legal title is transferred by indorsement and delivery or by delivery only; and (2) the transferee obtains a good title provided he is a purchaser for value without any notice of the infirmity of the instrument (*Evertson* v. *Bank*, 66 N. Y. 14) even though the title of his transferor was defective. Ordinary contracts pass by assignment, the assignee being subject to all the defenses that may exist between the original parties.

Presumption of Consideration.—Consideration in negotiable instruments is presumed conclusively between remote parties but subject to rebuttal between immediate parties. "Between the immediate parties to any contract evidenced by the drawing, accepting, making or indorsing a bill or note, it may be shown that there was no consideration, as that it was for accommodation; or that the contract failed, or a set-off may be pleaded; but as between other parties remote to each other, none of these defenses is admissible."

CLASSIFICATION OF NEGOTIABLE INSTRUMENTS.—Although there are many kinds of negotiable instruments, they may be broadly classified as: (1) promissory notes, and (2) bills of exchange.

Promissory Notes.—A promissory note is an unconditional written promise signed by the maker, to pay a sum certain in money, at a fixed or definite future time, either to the bearer or to the order of a person designated therein. (Daniels Neg. Inst., § 28; Neg. Inst. Law, N. Y., § 320; Chalmers Bills and Notes, § 291.)

Bills of Exchange.—"A bill of exchange is an unconditional order in writing upon one person by another for the payment of a sum of money absolutely and at all events." (Chalmers Bills and Notes, § 1; Neg. Inst. Law, N. Y., § 210.) "A **check** is a bill of exchange drawn on a bank payable on demand." (Neg. Inst. Law, N. Y., § 321.)

UNIFORM NEGOTIABLE INSTRUMENTS LAW.—The law governing negotiable instruments developed from the custom of merchants and was gradually incorporated into the common law of the land and referred to as the **Law Merchant.** During the past century the common law on negotiable instruments has been codified from time to time in nearly every jurisdiction founded on Anglo-Saxon jurisprudence. At present all the states of the

United States, with the exception of Georgia, have adopted the Uniform Negotiable Instruments Law as devised by the commissioners appointed for that purpose.

"The Negotiable Instrument Act was adopted by the several states for the purpose of establishing uniformity in the law regulating negotiable instruments. Where the act speaks, it controls and its meaning should be ascertained by interpreting the language used, and not by assuming that the common law on the subject should remain unaltered." (*First State Bank* v. *Williams*, 164 Ky. 143.) Although the statute generally known as "The Negotiable Instruments Law" supersedes the common law, it is at times necessary to refer to the common law for a correct interpretation of the statute.

The New York Negotiable Instruments Law is followed with reference to the numbering of sections. Sections of the law are quoted in their entirety in some instances; in others a comprehensive digest adhering as close to the statute as possible is set forth. Court decisions and comments interpreting the statute are given immediately after a number of sections of the law.

GENERAL REQUIREMENTS—FORM OF INSTRUMENT.—

§ 20. *Form of negotiable instrument.*—An instrument to be negotiable must conform to the following requirements:

1. It must be in writing and signed by the maker or drawer.
2. Must contain an unconditional promise or order to pay a sum certain in money.
3. Must be payable on demand, or at a fixed or determinable future time.
4. Must be payable to order or to bearer; and
5. Where the instrument is addressed to a drawee, he must be named or otherwise indicated therein with reasonable certainty.

Writing.—May be with pencil, ink, crayon, or any means to record a signature. (*Brayley* v. *Kelly*, 25 Minn. 160.)

Signature.—May be any mark, initial, name, code or designation a party may choose to adopt and intend to bind himself. (*Palmer* v. *Stephens*, 1 Denio [N. Y.] 471; *Merchants Bank* v. *Spicer*, 6 Wend. [N. Y.] 443.)

Order.—The words **to order, to bearer,** or equivalent words must be used to make an instrument negotiable. (*Wettlaufer* v. *Baxter*, 137 Ky. 362.) An instrument payable to a named person and not payable to order is not negotiable. (*Owens* v. *Blackburn*, 161 App. Div. [N. Y.] 827.) A note payable to the estate of a certain person on his death is not payable to order and is not negotiable. (*Kerr* v. *Smith*, 156 App. Div. [N. Y.] 807.) An instrument wherein either bearer or order of a named person is not indicated, is not a negotiable instrument. (*St. Lawrence Co. Bank* v. *Watkins*, 153 App. Div. [N. Y.] 551.)

CERTAINTY AS TO SUM.—

§ 21. *Certainty as to sum; what constitutes.*—The sum payable is a sum certain within the meaning of this act, although it is to be paid:

1. With interest; or
2. By stated instalments; or
3. By stated instalments, with a provision that upon default in payment of any instalment or of interest, the whole shall become due; or
4. With exchange, whether at a fixed rate or at the current rate; or
5. With costs of collection or an attorney's fee, in case payment shall not be made at maturity.

Sum Certain.—A sum which can be rendered certain by computation.

Instalments.—Negotiability is not affected by instalment payments. (*Riker* v. *Manufacturing Co.*, 14 R. I. 402; *Hodge* v. *Wallace*, 129 Wis. 84.)

Exchange.—Most of the courts have passed on the subject. (*Second Nat. Bank of Aurora* v. *Basnier*, 165 Fed. Rep. 58.)

Attorney's Fees.—A provision in a note to pay attorney's fees in case of non-payment, suit, or after maturity does not destroy its negotiability. (*Valparaiso Farmers Nat. Bank* v. *Sultan Mfg. Co.*, 52 Fed. 191; *Mechanics American Nat. Bank* v. *Coleman*, 204 Fed. Rep. 24.)

"Upon a careful review of the authorities, we can perceive no reason why a note otherwise imbued with all the attributes of negotiability is rendered non-negotiable by a stipulation which is entirely inoperative until after the maturity of the note and its dishonor by the maker. The amount to be paid is certain during the currency of the note as a negotiable instrument and it only becomes uncertain after it ceases to be negotiable by default of the maker in its payment. It is just that the creditor who has incurred an expense in the collection of the debt should be reimbursed by the debtor by whom the action was rendered necessary and the expenses entailed. (*Oppenheimer* v. *Farmers & Mechanics Bank*, 97 Tenn. 19.)

PROMISE TO PAY UNCONDITIONAL.—

§ 22. *When promise is unconditional.*—An unqualified order or promise to pay is unconditional within the meaning of this act, though coupled with:

1. An indication of a particular fund out of which reimbursement is to be made, or a particular account to be debited with the amount; or
2. A statement of the transaction which gives rise to the instrument.

But an order or promise to pay out of a particular fund is not unconditional.

Particular Fund Indicated.—**Payment** out of a particular fund destroys the negotiability of an instrument. (*Munger* v. *Shannon*, 61 N. Y. 251.)

Reimbursement out of a particular fund does not destroy negotiability. (*Smittler* v. *Simon*, 101 N. Y. 554.)

The Test.—The determining factor is whether the drawee is limited to a particular fund or whether he can charge the amount of the bill against the general account of the drawer when the specific fund named in the instrument is insufficient to satisfy the instrument. (*Munger* v. *Shannon*, 61 N. Y. 255.)

Statement of Transaction.—In the instrument does not affect negotiability. Such provisions are generally found in railway equipment notes. (*Chicago Ry. Equip. Co.* v. *Mechanics Nat. Bank*, 136 U. S. 268.)

Contingency in Statement of Transaction.—A note issued containing a statement of the transaction on which it was issued and where the contents of the note are dependent on the outcome of a contract referred to therein is not a negotiable instrument under the law. (*Pope* v. *Lumber Co.*, 162 N. C. 206.)

TIME OF PAYMENT.—

§ 23. *Determinable future time; what constitutes.*—An instrument is payable at a determinable future time, within the meaning of this act, which is expressed to be payable:

1. At a fixed period after date or sight; or
2. On or before a fixed or determinable future time specified therein; or
3. On or at a fixed period after the occurrence of a specified event, which is certain to happen, though the time of happening be uncertain.

An instrument payable upon a contingency is not negotiable, and the happening of the event does not cure the defect.

Certainty of Time.—There must be a fixed or ascertainable future time or a time which can be computed after the occurrence of an event certain to happen although the time of happening may be uncertain.

Fixed Time.—Must be indicated in the instrument. (*Citizens Nat. Bank* v. *Piolett*, 126 Pa. St. 194; *Akley School District* v. *Hall*, 113 U. S. 135.)

Future Time—Events Certain to Happen.—A note payable **at death** or a given number of days or months after death of the maker is a promissory note under the statute, because death is certain although the time is uncertain. (*Crider* v. *Shelby*, 95 Fed. 212; *Hegeman* v. *Moon*, 131 N. Y. 462.)

Contingent Time—Marriage, Age, etc.—Notes payable when a person marries, becomes of age, or when his ship comes in, are not within the statute, as the time depends on a contingency which may never happen. (*Husband* v. *Epling*, 81 Ill. 172; *Sloan* v. *McCarty*, 134 Mass. 245; *Rice* v. *Rice*, 43 App. Div. [N. Y.] 458.)

ADDITIONAL PROVISIONS IN INSTRUMENT.—

§ 24. *Additional provisions not affecting negotiability.*—An instrument which contains an order or promise to do any act in addition to the payment of money is not negotiable. But the negotiable character of an instrument otherwise negotiable is not affected by a provision which:

1. Authorizes the sale of collateral securities in case the instrument be not paid at maturity; or
2. Authorizes a confession of judgment if the instrument be not paid at maturity; or
3. Waives the benefit of any law intended for the advantage or protection of the obligor; or
4. Gives the holder an election to require something to be done in lieu of payment of money.

But nothing in this section shall validate any provision or stipulation otherwise illegal.

Collateral Security.—Negotiability is not affected by a recital in the note that collateral security has been deposited for the security of the note which is to be sold if the note is not paid at maturity. (*Perry* v. *Bigelow*, 128 Mass. 129.)

Judgment Notes.—Are in use in some states. In others, as New York, they are unknown. Confession of judgment is effective only at maturity. Where a note authorizes confession of judgment before maturity, it is not a negotiable instrument under the statute. (*First Nat. Bank of Elgin* v. *Russell*, 124 Tenn. 618.)

Holders' Election.—Where the holder has the election the instrument is within the law. If, however, the maker has the alternative of paying money or something else, the instrument is not negotiable. (*Hosstatter* v. *Wilson*, 36 Barb. [N. Y.] 307.)

OMISSIONS; SEAL; PARTICULAR MONEY; SPECIAL CONSIDERATION.—

§ 25. *Omissions; seal; particular money.*—The validity and negotiable character of an instrument are not affected by the fact that:

1. It is not dated; or
2. Does not specify the value given, or that any value has been given therefor; or
3. Does not specify the place where it is drawn or the place where it is payable; or
4. Bears a seal; or
5. Designates a particular kind of current money in which payment is to be made.

But nothing in this section shall alter or repeal any statute requiring in certain cases the nature of the consideration to be stated in the instrument.

Absence of Date.—See § 32 of the law. (*Church* v. *Stevens*, 107 N. Y. Supp. 310.)

Value Not Stated.—Value presumed. (See Daniels Neg. Inst., § 108.) (*McLeod* v. *Hunter*, 29 Misc. [N. Y.] 558.)

Seal.—Seal is surplusage. Negotiability not affected. (*Chase Nat. Bank* v. *Faurot*, 149 N. Y. 532; *Weeks* v. *Esler*, 143 N. Y. 374.)

Particular Kind of Money.—Negotiability not affected if the instrument is to be paid in gold, or bank notes, or other current money. (*Chrysler* v. *Renais*, 43 N. Y. 209.)

Nature of Consideration in Certain Cases.—Some states require that where an instrument is given for a patent right or a speculative consideration, it shall be so stated in the note. (See Neg. Inst. Law, § 330–332.)

WHEN PAYABLE ON DEMAND.—

§ 26. *When payable on demand.*—An instrument is payable on demand:

1. Where it is expressed to be payable on demand, or at sight, or on presentation; or
2. In which no time for payment is expressed.

Where an instrument is issued, accepted or indorsed when overdue, it is, as regards the person so issuing, accepting or indorsing it, payable on demand.

Where No Time Is Expressed.—The words **on demand** may be added without affecting the instrument. (Byles on Bills and Notes, § 210.)

Overdue Instruments.—A holder of overdue instruments which were negotiated before maturity can sue thereon in his own name. (*French* v. *Jarvis*, 29 Conn. 353.)

WHEN PAYABLE TO ORDER.—

§ 27. *When payable to order.*—The instrument is payable to order where it is drawn payable to the order of a specified person or to him or his order. It may be drawn payable to the order of:

1. A payee who is not maker, drawer or drawee; or
2. The drawer or maker; or
3. The drawee; or
4. Two or more payees jointly; or
5. One or some of several payees; or
6. The holder of an office for the time being.

Where the instrument is payable to order the payee must be named or otherwise indicated therein with reasonable certainty.

Specified Person Only.—An instrument payable to a specified person only without the word **order** is not negotiable. (Byles on Bills and Notes, p. 83.)

Payable to Maker.—Is not complete without indorsement and delivery.

Indorsement in the Alternative.—A note payable to either of two persons may be indorsed by either. (*Passut* v. *Heubner*, 81 Misc. [N. Y.] 14.)

Holder of an Office.—A note payable to a holder of an office or his successor is negotiable. (*Davis* v. *Gorr*, 6 N. Y. 124.)

Payee Indicated.—Need not be by name but may be done in any way to indicate his identity. (*U. S.* v. *White*, 2 Hill 59.)

WHEN PAYABLE TO BEARER.—

§ 28. *When payable to bearer.*—The instrument is payable to bearer:

1. When it is expressed to be so payable; or
2. When it is payable to a person named therein or bearer; or
3. When it is payable to the order of a fictitious or non-existing person, and such fact was known to the person making it so payable; or
4. When the name of the payee does not purport to be the name of any person; or
5. When the only or last indorsement is an indorsement in blank.

Fictitious or Non-existing Persons.—Must be known as such to the maker. A fraudulent representation as to the identity of the payee is not a fictitious person. (*Hartford* v. *Greenwich Bank*, 215 N. Y. 726.) If drawn to an existing person but the maker did not intend that it should be delivered, or indorsed by that person, the instrument is deemed to be payable to a fictitious person and therefore to the bearer. (*Trust Co. of America* v. *Hamilton Bank*, 127 App. Div. [N. Y.] 515.)

Last Indorsement in Blank.—An indorsement in blank on a non-negotiable instrument does not render it negotiable under the law. (*Johnson* v. *Lassiter*, 155 N. C. 47.)

LANGUAGE USED.—

§ 29. *Terms when sufficient.*—The instrument need not follow the language of this act, but any terms are sufficient which clearly indicate an intention to conform to the requirements hereof.

Foreign Language.—An instrument, otherwise sufficient, drawn in a foreign language is within the statute. (*Debebian* v. *Gala*, 64 Md. 262.)

DATE.—

§ 30. *Date, presumption as to.*—Where the instrument or an acceptance or any indorsement thereon is dated, such date is deemed *prima facie* to be the true date of the making, drawing, acceptance or indorsement, as the case may be.

§ 31. *Ante-dated and post-dated.*—The instrument is not invalid for the reason only that it is ante-dated or post-dated, provided this is not done for an illegal or fraudulent purpose. The person to whom an instrument so dated is delivered acquires the title thereto as of the date of delivery.

An instrument **postdated or antedated** for **an illegal purpose** is void to all persons having knowledge of it, otherwise it is good. (*Triphonoff* v. *Sweeney*, 65 Oregon 209; *Brewster* v. *McCardle*, 8 Wend. [N. Y.] 478.)

§ 32. *When date may be inserted.*—Where an instrument expressed to be payable at a fixed period after date is issued undated, or where the acceptance of an instrument payable at a fixed period after sight is undated, any holder may insert therein the true date of issue or acceptance, and the instrument shall be payable accordingly. The insertion of a wrong date does not avoid the instrument in the hands of a subsequent holder in due course; but as to him, the date so inserted is to be regarded as the true date.

Any holder may insert the true date of issue or acceptance of a valid undated instrument. The insertion of the wrong date does not avoid the instrument but the date so inserted is regarded as the true date to subsequent holders in due course. (*Redlich* v. *Doll*, 54 N. Y. 238; *Bank of Houston* v. *Day*, 145 Mo. App. 410.)

PLACE.—A negotiable instrument is presumed to be made at the place it is dated. (*Mfrs. Commercial Co.* v. *Blitz*, 131 App. Div. [N. Y.] 17.)

FILLING BLANKS AFTER DELIVERY.—

§ 33. *Blanks; when may be filled.*—Where the instrument is wanting in any material particular, the person in possession thereof has a *prima facie* authority to complete it by filling up the blanks therein. And a signature on a blank paper delivered by the person making the signature in order that the paper may be converted into a negotiable instrument operates as a *prima facie* authority to fill it up as such for any amount. In order, however, that any such instrument, when completed, may be enforced against any person who became a party thereto prior to its completion, it must be filled up strictly in accordance with the authority given and within a reasonable time. But if any such instrument, after completion, is negotiated to a holder in due course, it is valid and effectual for all purposes in his hands, and he may enforce it as if it had been filled up strictly in accordance with the authority given and within a reasonable time.

There are two different kinds of omissions or blank spaces in negotiable instruments which should be distinguished:

1. Blank spaces of such a nature that the instrument is incomplete until they are filled in.
2. Instruments apparently complete in context but with blank spaces which do not fill the paper.

The statute applies only to omissions indicated of the first kind. As to the second kind the decisions are in conflict. (*Nat. Exchange Bank* v. *Lester*, 194 N. Y. 461; *Yocum* v. *Smith*, 63 Ill. 321, *contra*.)

What, When and How Insertion Is to be Made.—Blanks must be filled up strictly in accordance with authority to complete the instruments in full, which must be done within a reasonable time. (*Weyerhauser* v. *Dunn*, 100 N. Y. 150.) As to a holder in due course an instrument is valid for all purposes where blanks are **filled up** but not in cases where there have been **alterations.** (*First Nat. Bank of Wilkes Barre* v. *Barnum*, 160 Fed. Rep. 245.)

INCOMPLETE INSTRUMENT AND UNDELIVERED.—

§ 34. *Incomplete instrument not delivered.*—Where an incomplete instrument has not been delivered it will not, if completed and negotiated, without authority, be a valid contract in the hands of any holder, as against any person whose signature was placed thereon before delivery.

Stolen Instruments.—An instrument never actually delivered is not negotiated and there can be no recovery on it even in the hands of an innocent purchaser for value. Where an instrument is stolen before delivery, as where a blank check is stolen and then filled out and passed to a holder for value, no recovery can be had on it. (*Linick* v. *Nutting*, 140 App. Div. [N. Y.] 265.)

DELIVERY.—

§ 35. *Delivery; when effectual; when presumed.*—Every contract on a negotiable instrument is incomplete and revocable until delivery of the instrument for the purpose of giving effect thereto. As between immediate parties, and as regards a remote party other than a holder in due course, the delivery, in order to be effectual, must be made either by or under the authority of the party making, drawing, accepting or indorsing, as the case may be; and in such case the delivery may be shown to have been conditional, or for a special purpose only, and not for the purpose of transferring the property in the instrument. But where the instrument is in the hands of a holder in due course, a valid delivery thereof by all parties prior to him so as to make them liable to him is conclusively presumed. And where the instrument is no longer in the possession of a party whose signature appears thereon, a valid and intentional delivery by him is presumed until the contrary is proved.

An instrument has no valid existence until delivered in accordance with the intent of the parties and takes effect from the time of delivery only. (*Grannis* v. *Stevens*, 216 N. Y. 583; *Burr* v. *Beckler*, 264 Ill. 230.)

Conditional Delivery.—Parol evidence between original parties regarding conditional delivery of an instrument is admitted and is not considered as an attempt to modify a written instrument. (*Reynolds* v. *Robinson*, 110 N. Y. 654; *Hill* v. *Hall*, 191 Mass. 253.)

Holder in Due Course.—In the hands of a holder in due course delivery is conclusively presumed. (*Hibbs* v. *Brown*, 190 N. Y. 167.)

AMBIGUOUS CONSTRUCTION.—

§ 36. *Construction where instrument is ambiguous.*—Where the language of the instrument is ambiguous, or there are omissions therein, the following rules of construction apply:

1. Where the sum payable is expressed in words and also in figures and there is a discrepancy between the two, the sum denoted by the words is the sum payable; but if the words are ambiguous or uncertain, references may be had to the figures to fix the amount;

2. Where the instrument provides for the payment of interest, without specifying the date from which interest is to run, the interest runs from the date of the instrument and if the instrument is undated, from the issue thereof;

3. Where the instrument is not dated, it will be considered to be dated as of the time it was issued;

4. Where there is a conflict between the written and printed provisions of the instrument, the written provisions prevail;

5. Where the instrument is so ambiguous that there is doubt whether it is a bill or note, the holder may treat it as either at his election;

6. Where a signature is so placed upon the instrument that it is not clear in what capacity the person making the same intended to sign, he is to be deemed an indorser;

7. Where an instrument containing the words "I promise to pay" is signed by two or more persons, they are deemed to be jointly and severally liable thereon.

Marginal Notes.—On an instrument do not form part of it. (*Schreyer* v. *Hawkes*, 22 Ohio St. 308.)

Interest Rate.—An instrument payable with interest and the rate not specified, the legal rate is presumed. (*Hornstein* v. *Cifuno*, 86 Neb. 103.)

Written and Printed Parts.—Any part of the printed matter necessary for the construction of the written part so as to arrive at a reasonable construction of the instrument as a whole cannot be rejected. (*Miller* v. *Hannibal & St. J. R. R. Co.*, 90 N. Y. 430.) If typewritten and handwritten, the handwritten governs. (*Acme Coal Co.* v. *Northrop Nat. Bank*, 146 Pac. Rep. [Wyo.] 593.)

SIGNATURE AND LIABILITY.—

Trade or Assumed Name.—

§ 37. *Liability of person signing in trade or assumed name.*—No person is liable on the the instrument whose signature does not appear thereon, except as herein otherwise expressly provided. But one who signs in a trade or assumed name will be liable to the same extent as if he had signed in his own name.

"A person may become a party to a bill or note by any mark or designation he chooses to adopt, provided it be used as a substitute for his name and he intends to be bound by it." (*De Witt* v. *Walton*, 9 N. Y. 571.)

Agent's Signature.—

§ 38. *Signature by agent; authority; how shown.*—The signature of any party may be made by a duly authorized agent. No particular form of appointment is necessary for this purpose; and the authority of the agent may be established as in other cases of agency.

§ 39. *Liability of person signing as agent, etc.*—Where the instrument contains or a person adds to his signature words indicating that he signs for or on behalf of a principal, or in a representative capacity, he is not liable on the instrument if he was duly authorized; but the mere addition of words describing him as an agent, or as filling a representative character, without disclosing his principal, does not exempt him from personal liability.

A duly authorized agent binds his principal on a negotiable instrument and he is not personally liable if he discloses his principal. A failure to disclose his principal makes him personally liable.

Descriptive Term.—A person signing an instrument by merely adding a descriptive term such as **trustee, agent,** etc., does not relieve himself from personal liability. (*Casco Nat. Bank* v. *Clarke*, 139 N. Y. 307.)

Corporate Officer.—An officer of a corporation signing a negotiable instrument of the corporation in his own name without a description of his official title or without qualifications is personally liable on the instrument. (*Brooklyn First Nat. Bank* v. *Wallis*, 150 N. Y. 455.)

Procuration.—

§ 40. *Signature by procuration; effect of.*—A signature by "procuration" operates as notice that the agent has but a limited authority to sign, and the principal is bound only in case the agent in so signing acted within the actual limits of his authority.

Such signature is not used much in the United States.

Indorsement by Infant or Corporation.—

§ 41. *Effect of indorsement by infant or corporation.*—The indorsement or assignment of the instrument by a corporation or by an infant passes the property therein, notwithstanding that from want of capacity the corporation or infant may incur no liability thereon.

Forged Signature.—

§ 42. *Forged signature; effect of.*—Where a signature is forged or made without authority of the person whose signature it purports to be, it is wholly inoperative, and no right to retain the instrument, or to give a discharge therefor, or to enforce payment thereof against any party thereto, can be acquired through or under such signature, unless the party against whom it is sought to enforce such right is precluded from setting up the forgery or want of authority.

Case under the statute. (*Seaboard Nat. Bank* v. *Bank of America*, 193 N. Y. 26.)

Consideration.—

§ 50. *Presumption of consideration.*—Every negotiable instrument is deemed *prima facie* to have been issued for a valuable consideration; and every person whose signature appears thereon to have become a party thereto for value.

Words **value received** are surplusage. Their omission does not impair negotiability. (*McLeod* v. *Hunter*, 29 Misc. [N. Y.] 559.) These words are important in non-negotiable instruments as they amount to an admission that the instrument was issued for a consideration. (*Owen* v. *Blackburn*, 161 App. Div. [N. Y.] 827.)

§ 51. *Consideration, what constitutes.*—Value is any consideration sufficient to support a simple contract. An antecedent or pre-existing debt constitutes value; and is deemed such whether the instrument is payable on demand or at a future time.

"A valuable consideration may consist of some right, interest, profit or benefit accruing to one party, or some forbearance, detriment, loss or responsibility given, suffered or undertaken by the other." (*St. Mark's Church* v. *Teed*, 120 N. Y. 583.)

Exchange of Notes.—One promissory note constitutes a good consideration for the other. (*Mehlinger* v. *Harriman*, 185 Mass. 245; *State Bank* v. *Smith*, 155 N. Y. 185.)

HOLDER FOR VALUE.—

§ 52. *What constitutes holder for value.*—Where value has at any time been given for the instrument, the holder is deemed a holder for value in respect to all parties who became such prior to that time.

§ 53. *When lien on instrument constitutes holder for value.*—Where the holder has a lien on the instrument, arising either from contract or by implication of law, he is deemed a holder for value to the extent of his lien.

§ 54. *Effect of want of consideration.*—Absence or failure of consideration is matter of defense as against any person not a holder in due course; and partial failure of consideration is a defense *pro tanto*, whether the failure is an ascertained and liquidated amount or otherwise.

Want of consideration does not affect negotiability. (*Dingman* v. *Amsink*, 77 Pa. St. 114.)

Exchange of Notes.—In an exchange of notes, one note is a consideration for the other and neither party is regarded as an accommodation party. (*State Bank* v. *Smith*, 155 N. Y. 185.)

LIABILITY OF ACCOMMODATION PARTY.—

§ 55. *Liability of accommodation party.*—An accommodation party is one who has signed the instrument as maker, drawer, acceptor or indorser, without receiving value therefor,

and for the purpose of lending his name to some other person. Such a person is liable on the instrument to a holder for value, notwithstanding such holder at the time of taking the instrument knew him to be only an accommodation party.

"A mutual exchange of notes will amount to a sufficient consideration so that the notes will not be regarded as accommodation paper." (*Rice* v. *Grange*, 131 N. Y. 149.)

Corporations.—Corporations are without power to become accommodation parties. (*Nat. Bank of Commerce* v. *Atkinson*, 55 Fed. Rep. 465; *Jacobus* v. *Jamestown Mantel Co.*, 211 N. Y. 154.)

WHAT CONSTITUTES NEGOTIATION.—

§ 60. *What constitutes negotiation.*—An instrument is negotiated when it is transferred from one person to another in such manner as to constitute the transferee the holder thereof. If payable to bearer it is negotiated by delivery; if payable to order it is negotiated by the indorsement of the holder completed by delivery.

Necessity for Delivery.—Indorsement without delivery conveys no title. (*Middleton* v. *Griffith*, 57 N. J. L. 442.)

INDORSEMENT.—

§ 61. *Indorsement; how made.*—The indorsement must be written on the instrument itself or upon a paper attached thereto. The signature of the indorser, without additional words, is a sufficient indorsement.

Place of indorsement is usually on the back of an instrument but may be anywhere on it. (*Hains* v. *Dubois*, 29 N. J. L. 259; Neg. Ins. Law, N. Y., § 36.)

Indorsement made by **rubber stamp signature,** by one having authority with intent to indorse the instrument, is a valid indorsement. (*Evans* v. *Freeman*, 142 N. C. 61.)

The holder has the burden of proving the genuineness of each indorsement necessary to support his **title.** (*Hathaway* v. *County of Delaware*, 185 N. Y. 374.)

§ 62. *Indorsement must be of entire instrument.*—The indorsement must be an indorsement of the entire instrument. An indorsement, which purports to transfer to the indorsee a part only of the amount payable, or which purports to transfer the instrument to two or more indorsees severally, does not operate as a negotiation of the instrument. But where the instrument has been paid in part, it may be indorsed as to the residue.

§ 63. *Kinds of indorsement.*—An indorsement may be either special or in blank; and it may also be either restrictive or qualified, or conditional.

§ 64. *Special indorsement; indorsement in blank.*—A special indorsement specifies the person to whom, or to whose order the instrument is to be payable; and the indorsement of such indorsee is necessary to the further negotiation of the instrument. An indorsement in blank specifies no indorsee, and an instrument so indorsed is payable to bearer, and may be negotiated by delivery.

§ 65. *Blank indorsement; how changed to special indorsement.*—The holder may convert a blank indorsement into a special indorsement by writing over the signature of the indorser in blank any contract consistent with the character of the indorsement.

§ 66. *When indorsement restrictive.*—An indorsement is restrictive, which either:

1. Prohibits the further negotiation of the instrument; or
2. Constitutes the indorsee the agent of the indorser; or
3. Vests the title in the indorsee in trust for or to the use of some other person.

But the mere absence of words implying power to negotiate does not make an indorsement restrictive.

Checks and drafts deposited with banks for collection are generally indorsed under § 66–2.

An illustration of **restrictive indorsement** under § 66–3 is: "Pay X for account of Y." Title passes to X but the indorsement is limited to the

extent that it gives notice that the instrument cannot be negotiated by X for his own benefit. (*Hook* v. *Pratt*, 78 N. Y. 371.)

§ 67. *Effect of restrictive indorsement; rights of indorsee.*—A restrictive indorsement confers upon the indorsee the right:

1. To receive payment of the instrument;
2. To bring any action thereon that the indorser could bring;
3. To transfer his rights as such indorsee, where the form of the indorsement authorizes him to do so.

But all subsequent indorsees acquire only the title of the first indorsee under the restrictive indorsement.

§ 68. *Qualified indorsement.*—A qualified indorsement constitutes the indorser a mere assignor of the title to the instrument. It may be made by adding to the indorser's signature the words "without recourse" or any words of similar import. Such an indorsement does not impair the negotiable character of the instrument.

Qualified indorsement may be made by adding to the indorsement **"without recourse"** or words of similar import. (*Schmidt* v. *Pegg*, 172 Mich. 160.) A qualified or restrictive indorsement does not impair the **negotiable character** of the instrument. (*Page* v. *Ford*, 65 Ore. 450.)

§ 69. *Conditional indorsement.*—Where an indorsement is conditional, a party required to pay the instrument may disregard the condition and make payment to the indorsee or his transferee, whether the condition has been fulfilled or not. But any person to whom an instrument so indorsed is negotiated will hold the same, or the proceeds thereof subject to the rights of the person indorsing conditionally.

§ 70. *Indorsement of instrument payable to bearer.*—Where an instrument, payable to bearer, is indorsed specially, it may nevertheless be further negotiated by delivery; but the person indorsing specially is liable as indorser to only such holders as make title through his indorsement.

§ 71. *Indorsement where payable to two or more persons.*—Where an instrument is payable to the order of two or more payees or indorsees who are not partners, all must indorse, unless the one indorsing has authority to indorse for the others.

(*Martz* v. *State Nat. Bank*, 147 App Div. [N. Y.] 250.)

§ 72. *Effect of instrument drawn or indorsed to a person as cashier.*—Where an instrument is drawn or indorsed to a person as "cashier" or other fiscal officer of a bank or corporation, it is deemed *prima facie* to be payable to the bank or corporation of which he is such officer; and may be negotiated by either the indorsement of the bank or corporation, or the indorsement of the officer.

(*Quincy Mut. Fire Ins. Co.* v. *Int. Trust Co.*, 217 Mass. 370; *Johnson* v. *Buffalo Center State Bank*, 134 Iowa 731.)

§ 73. *Indorsement where name is misspelled, et cetera.*—Where the name of a payee or indorsee is wrongly designated or misspelled, he may indorse the instrument as therein described, adding, if he think fit, his proper signature.

§ 74. *Indorsement in representative capacity.* Where any person is under obligation to indorse in a representative capacity, he may indorse in such terms as to negative personal liability.

As to **executor or administrator,** see *Smittler* v. *Simon*, 101 N. Y. 554. As to others, see *Chelsea Exchange Bank* v. *First U. P. Church*, 80 Misc. [N. Y.] 616.

§ 75. *Time of indorsement; presumption.*—Except where an indorsement bears date after the maturity of the instrument, every negotiation is deemed *prima facie* to have been effected before the instrument was overdue.

§ 76. *Place of indorsement; presumption.*—Except where the contrary appears every indorsement is presumed *prima facie* to have been made at the place where the instrument is dated.

The importance of this section is realized when it is recalled that an indorsement not alone transfers the instrument but is also a new contract embodying the contents of the instrument. As, for instance, a note made in

one state and subsequently indorsed in another becomes a contract governed by the laws of the latter state. (*Chemical Nat. Bank* v. *Kellogg*, 183 N. Y. 92; *Glidden* v. *Chamberlin*, 167 Mass. 486.)

§ 77. *Continuation of negotiable character.*—An instrument negotiable in its origin continues to be negotiable until it has been restrictively indorsed or discharged by payment or otherwise.

§ 78. *Striking out indorsement.*—The holder may at any time strike out any indorsement which is not necessary to his title. The indorser whose indorsement is struck out, and all indorsers subsequent to him, are thereby relieved from liability on the instrument.

§ 79. *Transfer without indorsement; effect of.*—Where the holder of an instrument payable to his order transfers it for value without indorsing it, the transfer vests in the transferee such title as the transferrer had therein, and the transferee acquires, in addition, the right to have the indorsement of the transferrer. But for the purpose of determining whether the transferee is a holder in due course, the negotiation takes effect as of the time when the indorsement is actually made.

§ 80. *When prior party may negotiate instrument.*—Where an instrument is negotiated back to a prior party, such party may, subject to the provisions of this act, reissue and further negotiate the same. But he is not entitled to enforce payment thereof against any intervening party to whom he was personally liable.

RIGHTS OF HOLDER.—

To sue.—

§ 90. *Right of holder to sue; payment.*—The holder of a negotiable instrument may sue thereon in his own name; and payment to him in due course discharges the instrument. (*Lowell* v. *Brickford*, 201 Mass. 543; *Hathaway* v. *County of Delaware*, 185 N. Y. 374.)

HOLDER IN DUE COURSE.—

§ 91. *What constitutes a holder in due course.*—A holder in due course is a holder who has taken the instrument under the following conditions:

1. That it is complete and regular upon its face;
2. That he became the holder of it before it was overdue, and without notice that it had been previously dishonored, if such were the fact;
3. That he took it in good faith and for value;
4. That at the time it was negotiated to him he had no notice of any infirmity in the instrument or defect in the title of the person negotiating it.

As to completeness and regularity see *Hunter* v. *Allen*, 127 App. Div. [N. Y.] 572.

Negotiable instruments acquired **after maturity** become subject to the same defenses as if non-negotiable. (*Cole* v. *Stearns*, 162 N. Y. 637.)

A **bank discounting paper** and merely placing amount to the credit of customer does not become a holder in due course. (*Citizens State Bank* v. *Cowles*, 180 N. Y. 346.) But if the sum so credited is drawn on and checked out, the bank becomes a holder in due course. (*Merchants Bank* v. *Santa Maria Sugar Co.*, 162 App. Div. [N. Y.] 248.)

A gift of a negotiable instrument does not make the donee a holder in due course. (*Greer* v. *Orchard*, 175 Mo. App. 494.)

§ 92. *When person not deemed holder in due course.*—Where an instrument payable on demand is negotiated an unreasonable length of time after its issue, the holder is not deemed a holder in due course.

What constitutes a **reasonable time** depends on the facts in each case. (*Commercial Nat. Bank* v. *Zimmermann*, 185 N. Y. 310.)

§ 93. *Notice before full amount paid.*—Where the transferee receives notice of any infirmity in the instrument or defect in the title of the person negotiating the same before he has paid the full amount agreed to be paid therefor, he will be deemed a holder in due course only to the extent of the amount theretofore paid by him.

§ 94. *When title defective.*—The title of a person who negotiates an instrument is defective within the meaning of this act when he obtained the instrument, or any signature thereto, by fraud, duress, or force and fear, or other unlawful means, or for an illegal consideration, or when he negotiates it in breach of faith, or under such circumstances as amount to a fraud.

§ 95. *What constitutes notice of defect.*—To constitute notice of an infirmity in the instrument or defect in the title of the person negotiating the same, the person to whom it is negotiated must have had actual knowledge of the infirmity or defect, or knowledge of such facts that his action in taking the instrument amounted to bad faith.

For **actual notice,** see cases: *Swift* v. *Smith*, 102 U. S. 442; *Jarvis* v. *Manhattan Beach Co.*, 148 N. Y. 652; *Interboro Brewing Co.* v. *Doyle*, 165 App. Div. [N. Y.] 646.

Inquiry.—The transferee is not required to make inquiry. (*Cheever* v. *Pittsburgh etc. R. Co.*, 150 N. Y. 59.)

A holder's knowledge of the poor **financial condition of the maker** is not sufficient to put him on notice of a defect, as he has a right to rely on the indorsements. (*Baruch* v. *Buckley*, 167 App. Div. [N. Y.] 113.)

A **purchase at discount,** even though it is large, is not sufficient to deprive the holder of rights of a holder in due course. (*Ham* v. *Merrett*, 150 Ky. 11.) If the discount is very large and there are other factors, they may be considered together to determine if he became a holder for value in good faith. (*Sabine* v. *Paine*, 166 App. Div. [N. Y.] 10.)

Negotiable instrument issued **by a corporate officer** for his personal benefit or use is *prima facie* unlawful and unless authorized the person taking such paper does so at his peril. (*Wilson* v. *Metropolitan Ry. Co.*, 120 N. Y. 145.)

Negotiable instrument issued under **duress** is void. (*Magoon* v. *Reber*, 76 Wis. 392.)

RIGHTS OF HOLDER IN DUE COURSE.—

§ 96. *Rights of holder in due course.*—A holder in due course holds the instrument free from any defect of title of prior parties and free from defenses available to prior parties among themselves, and may enforce payment of the instrument for the full amount thereof against all parties liable thereon.

Stolen Securities.—An incomplete instrument stolen before negotiated is not valid in the hands of a holder. (*Limmick* v. *Nutting*, 140 App. Div. [N. Y.] 265.) Where, however, the instrument has been negotiated, an innocent purchaser for value becomes a holder in due course even if his title is derived from one who has stolen the instrument after issue. (*Mass. Nat. Bank* v. *Snow*, 187 Mass. 160.) (See note under § 34.)

Instruments Issued in Violation of Law.—The decisions of the courts interpreting this section are in conflict. The predominating rule seems to hold that a negotiable instrument issued in violation of some statute and void between original parties is, however, good and enforcible against the maker if in the hands of a holder in due course. (*Wirt* v. *Stubblefield*, 17 App. Case [D. C.] 283.)

Probably the weight of authority is to construe this section to meet the requirements of commerce as expressed by Judge Van: "The business of the country is done so largely by means of commercial paper that the interests of commerce require that a promissory note, fair on its face, should be as negotiable as a government bond. Every restriction upon the circulation of negotiable papers is an injury to the state, for it tends to derange trade and hinders the transaction of business." (*Chemical Nat. Bank* v. *Kellogg*, 183 N. Y. 92.) Courts of other states hold that a negotiable instrument issued in violation of law is invalid against the maker even in the hands of

innocent purchasers on the ground of public policy. (*Alexander* v. *Hazelrigg* 123 Ky. 677.)

Instruments Purchased Under Par.—"We are of opinion that a purchaser of negotiable security before maturity, in cases where he is not personally chargeable with fraud, is entitled to recover its full amount against its maker, though he may have paid less than par value whatever may have been the original infirmity." (*Cromwell* v. *County of Sac.*, 96 U. S. 51.)

When Subject to Original Defenses.—

§ 97. *When subject to original defenses.*—In the hands of any holder other than a holder in due course, a negotiable instrument is subject to the same defenses as if it were non-negotiable. But a holder who derives his title through a holder in due course, and who is not himself a party to any fraud or illegality affecting the instrument, has all the rights of such former holder in respect of all parties prior to the latter.

Who is Deemed Holder in Due Course.—

§ 98. *Who deemed holder in due course.*—Every holder is deemed *prima facie* to be a holder in due course; but when it is shown that the title of any person who has negotiated the instrument was defective, the burden is on the holder to prove that he or some person under whom he claims acquired the title as a holder in due course. But the last-mentioned rule does not apply in favor of a party who became bound on the instrument prior to the acquisition of such defective title.

Stolen Instruments.—Burden of proof is on the holder that he obtained the instrument from a holder in due course. (*Lawyers Title etc. Co.* v. *Jones*, 113 App. Div. [N. Y.] 105.)

LIABILITY OF MAKER.—

§ 110. *Liability of maker.*—The maker of a negotiable instrument by making it engages that he will pay it according to its tenor; and admits the existence of the payee and his then capacity to indorse.

The maker is primarily liable even if he signed only for **accommodation.** (*Richards* v. *Market Exchange Bank*, 81 Ohio State 348.)

Where an indorser deposited security for the payment of the instrument, this is not a defense for the maker. (*People's Nat. Bank* v. *Rice*, 149 App. Div. [N. Y.] 18.)

If an assumed or trade name is used for an existing payee, the maker is estopped from setting up that the payee is fictitious. (*Jones* v. *Home Furn. Co.*, 9 App. Div. [N. Y.] 103.)

LIABILITY OF DRAWER.—

§ 111. *Liability of drawer.*—The drawer by drawing the instrument admits the existence of the payee and his then capacity to indorse; and engages that on due presentment the instrument will be accepted and paid, or both, according to its tenor, and that if it be dishonored and the necessary proceedings on dishonor be duly taken, he will pay the amount thereof to the holder, or to any subsequent indorser who may be compelled to pay it. But the drawer may insert in the instrument an express stipulation negativing or limiting his own liability to the holder.

LIABILITY OF ACCEPTOR.—

§ 112. *Liability of acceptor.*— The acceptor by accepting the instrument engages that he will pay it according to the tenor of his acceptance; and admits:

1. The existence of the drawer, the genuineness of his signature, and his capacity and authority to draw the instrument; and
2. The existence of the payee and his then capacity to indorse.

The acceptor is estopped from setting up **incapacity of drawer** where the instrument is drawn by an infant, married woman, or a corporation without such power. (*Cowton* v. *Wickersham*, 54 Pa. St. 302: *Jones* v. *Darch*, 4 Price 300.)

Drawee cannot hold the drawer where acceptance was for **accommodation** until he (the drawee) has paid the instrument. (*Christian* v. *Keen*, 80 Va. 369.)

WHO IS DEEMED INDORSER?—

§ 113. *When person deemed indorser.*—A person placing his signature upon an instrument otherwise than as maker, drawer or acceptor is deemed to be an indorser, unless he clearly indicates by appropriate words his intention to be bound in some other capacity.

Intention to be bound otherwise must be clear and distinct by appropriate language and cannot be inferred by equivocal language or conduct. (*McDonald* v. *Luckenbach*, 170 Fed. Rep. 434.)

Individual liability is not incurred by an **officer** indorsing as an officer of the corporation. (*McDonald* v. *Luckenbach*, 170 Fed. Rep. 434.)

The rule is that a **partner** indorsing in his individual capacity, different than or in addition to his partnership indorsement, incurs a double liability from the two separate and distinct indorsements made by him. (*Fourth Nat. Bank* v. *Mead*, 216 Mass. 521.)

IRREGULAR INDORSER.—

§ 114. *Liability of irregular indorser.*—Where a person, not otherwise a party to an instrument, places thereon his signature in blank before delivery, he is liable as indorser in accordance with the following rules:

1. If the instrument is payable to the order of a third person, he is liable to the payee and to all subsequent parties.
2. If the instrument is payable to the order of the maker or drawer, or is payable to bearer, he is liable to all parties subsequent to the maker or drawer.
3. If he signs for the accommodation of the payee he is liable to all parties subsequent to the payee.

WARRANTY WHERE NEGOTIATION BY DELIVERY.—

§ 115. *Warranty where negotiation by delivery, et cetera.*—Every person negotiating an instrument by delivery or by a qualified indorsement, warrants:

1. That the instrument is genuine and in all respects what it purports to be;
2. That he has a good title to it;
3. That all prior parties had capacity to contract;
4. That he has no knowledge of any fact which would impair the validity of the instrument or render it valueless.

But when the negotiation is by delivery only, the warranty extends in favor of no holder other than the immediate transferee. The provisions of subdivision three of this section do not apply to persons negotiating public or corporate securities, other than bills and notes.

Implied and Express Warranties.—"It has long been the settled law of this State, and now been made law by statute, that every person negotiating a negotiable instrument by delivery or by qualified indorsement, warrants that the instrument is genuine and in all respects what it purports to be." (*Gaboy* v. *Doane*, 66 App. Div. [N. Y.] 507.) The warranties referred to in the statute are implied warranties. The parties may draw such express warranties as they may choose. (*Bell* v. *Dagg*, 60 N. Y. 528.)

Knowledge of Defect.—If an indorser knows an instrument is void he will be liable to the purchaser. (*Littauer* v. *Goldman*, 72 N. Y. 506.)

GENERAL INDORSER.—

§ 116. *Liability of general indorser.*—Every indorser who indorses without qualification, warrants to all subsequent holders in due course:

1. The matter and things mentioned in subdivisions one, two and three of the next preceding section; and

2. That the instrument is at the time of his indorsement valid and subsisting.

And, in addition, he engages that on due presentment, it shall be accepted or paid, or both, as the case may be, according to its tenor, and that if it be dishonored, and the necessary proceedings on dishonor be duly taken, he will pay the amount thereof to the holder, or to any subsequent indorser who may be compelled to pay it.

The warranties are in favor of subsequent holders only.

Indorsement guaranteed on back of an instrument guarantees the entire instrument and all indorsements except the signature of the drawer. (*N. Y. Produce Ex. Bank* v. *Twelfth Ward Bank*, 135 App. Div. 52.)

It is beyond the power of an **executor** to bind the estate of which he is executor by a contract of indorsement. (*Schmittler* v. *Simon*, 101 N. Y. 554.)

LIABILITY OF INDORSERS.—

§ 117. *Liability of indorser where paper negotiable by delivery.*—Where a person places his indorsement on an instrument negotiable by delivery he incurs all the liabilities of an indorser.

§ 118. *Order in which indorsers are liable.*—As respects one another, indorsers are liable *prima facie* in the order in which they indorse; but evidence is admissible to show that as between or among themselves they have agreed otherwise. Joint payees or joint indorsees who indorse are deemed to indorse jointly and severally.

The rule applies to **accommodation indorsers** as well as others.

LIABILITY OF AGENT.—

§ 119. *Liability of agent or broker.*—Where a broker or other agent negotiates an instrument without indorsement, he incurs all the liabilities prescribed by section one hundred and fifteen of this act, unless he discloses the name of his principal, and the fact that he is acting only as agent.

PRESENTMENT FOR PAYMENT.—

§ 130. *Effect of want of demand on principal debtor.*—Presentment for payment is not necessary in order to charge the person primarily liable on the instrument; but if the instrument is, by its terms, payable at a special place, and he is able and willing to pay it there at maturity and has funds there available for that purpose, such ability and willingness are equivalent to a tender of payment upon his part. But except as herein otherwise provided, presentment for payment is necessary in order to charge the drawer and indorsers.

The rule in the United States is that although the instrument is payable at a particular place, it is not necessary, to recover from the maker, to prove presentment or demand for payment at such a place. However, failure to present at that place relieves the party primarily liable from costs or damages if he was ready, able, and willing to make payment at that place.

PRESENTMENT WHERE NOT PAYABLE ON DEMAND.—

§ 131. *Presentment where instrument is not payable on demand.*—Where the instrument is not payable on demand, presentment must be made on the day it falls due. Where it is payable on demand, presentment must be made within a reasonable time after its issue, except that in case of a bill of exchange, presentment for payment will be sufficient if made within a reasonable time after the last negotiation thereof.

Reasonable time depends on circumstances in each case. No definite rule laid down by the courts. Usage of trade seems to govern. As banks generally make paper payable within 4 months, this is deemed a reasonable time to present paper payable on demand. (*Frazee* v. *Phoenix Nat. Bank*. 161 Ky. 175.) In Massachusetts, in the absence of usage of trade a reasonable time to present demand instruments in order to hold indorsers is 60 days. (*Merritt* v. *Jackson*, 181 Mass. 67.)

WHAT CONSTITUTES SUFFICIENT PRESENTMENT.—

§ 132. *What constitutes a sufficient presentment.*—Presentment for payment, to be sufficient, must be made:

1. By the holder, or by some person authorized to receive payment on his behalf;
2. At a reasonable hour on a business day;
3. At a proper place as herein defined;
4. To the person primarily liable on the instrument, or if he is absent or inaccessible, to any person found at the place where the presentment is made.

Time of Day.—Instruments payable at a bank must be presented within banking hours; at a place of business within usual business hours; at a residence before the usual hours of rest, as late as 9 P.M. having been held a reasonable hour. (*Farnsworth* v. *Allen*, 4 Gray 453.)

PLACE OF PRESENTMENT.—

§ 133. *Place of presentment.*—Presentment for payment is made at the proper place:
1. Where a place of payment is specified in the instrument and it is there presented;
2. Where no place of payment is specified, but the address of the person to make payment is given in the instrument and it is there presented;
3. Where no place of payment is specified and no address is given and the instrument is presented at the usual place of business or residence of the person to make payment.
4. In any other case if presented to the person to make payment wherever he can be found, or if presented at his last known place of business or residence.

Where No Place Specified.—The maker's usual place of business is sufficient even if no one is there to answer, as the maker is bound to have a person there to answer and pay his note if presented. (*Baumgardner* v. *Rieves*, 35 Pa. St. 250.)

INSTRUMENT TO BE EXHIBITED.—

§ 134. *Instrument must be exhibited.*—The instrument must be exhibited to the person from whom payment is demanded, and when it is paid must be delivered up to the party paying it.

Demand over telephone is not sufficient as it does not comply with the statute. (*Gilpin* v. *Savage*, 201 N. Y. 167.)

Request for payment in an informal manner not intended, as presentment is insufficient. (*State of N. Y. Nat. Bank* v. *Kennedy*, 145 App. Div. [N. Y.] 669.)

PRESENTMENT WHEN PAYABLE AT BANK.—

§ 135. *Presentment where instrument payable at bank.*—Where the instrument is payable at a bank, presentment for payment must be made during banking hours, unless the person to make payment has no funds there to meet it at any time during the day, in which case presentment at any hour before the bank is closed on that day is sufficient.

Where bank is closed and in hands of receiver, demand on receiver personally is not necessary. Instruments, however, may be presented at the bank (*Schlesinger* v. *Schultz*, 110 App. Div. [N. Y.] 356) or as set forth in § 133.

PRESENTMENT WHERE PRINCIPAL DEBTOR IS DEAD.—

§ 136. *Presentment where principal debtor is dead.*—Where the person primarily liable on the instrument is dead, and no place of payment is specified, presentment for payment must be made to his personal representative, if such there be, and if with the exercise of reasonable diligence, he can be found.

As to **reasonable diligence** see *Reed* v. *Spear*, 107 App. Div. [N. Y.] 144.

Although the holder is relieved from making presentment under this section, it does not relieve him from giving notice of dishonor to the **indorsers** to hold them. (*Reed* v. *Spear*, 107 App. Div. [N. Y.] 144.)

PRESENTMENT TO PARTNERS OR JOINT DEBTORS.—

§ 137. *Presentment to persons liable as partners.*—Where the persons primarily liable on the instrument are liable as partners, and no place of payment is specified, presentment for payment may be made to any one of them, even though there has been a dissolution of the firm.

§ 138. *Presentment to joint debtors.*—Where there are several persons not partners, primarily liable on the instrument, and no place of payment is specified, presentment must be made to them all.

WHEN PRESENTMENT NOT REQUIRED TO CHARGE DRAWER.—

§ 139. *When presentment not required to charge the drawer.*—Presentment for payment is not required in order to charge the drawer where he has no right to expect or require that the drawee or acceptor will pay the instrument.

Although the drawer has no funds in the hands of the drawee, presentment is not dispensed with. (*Life Ins. Co.* v. *Pendleton*, 112 U. S. 708.)

WHEN PRESENTMENT NOT REQUIRED TO CHARGE INDORSER.—

§ 140. *When presentment not required to charge the indorser.*—Presentment for payment is not required in order to charge an indorser where the instrument was made or accepted for his accommodation, and he has no reason to expect that the instrument will be paid if presented.

DELAY IN PRESENTMENT.—

§ 141. *When delay in making presentment is excused.*—Delay in making presentment for payment is excused when the delay is caused by circumstances beyond the control of the holder and not imputable to his default, misconduct or negligence. When the cause of delay ceases to operate, presentment must be made with reasonable diligence.

Sickness is not an excuse for failure to present a note for payment at the proper time, unless the illness is so severe that the holder cannot direct another to present it. In that case presentment must be made as soon as the disability is removed. (*Wilson* v. *Senier*, 14 Wis. 380.)

WHEN PRESENTMENT IS DISPENSED WITH.—

§ 142. *When presentment may be dispensed with.*—Presentment for payment is dispensed with:

1. Where, after the exercise of reasonable diligence presentment as required by this act cannot be made;
2. Where the drawee is a fictitious person;
3. By waiver of presentment express or implied.

Insolvency of maker or acceptor does not dispense with the necessity for presentment. (*J. W. O'Bannan Co.* v. *Curran*, 129 App. Div. [N. Y.] 90.)

DISHONOR BY NON-PAYMENT.—

§ 143. *When instrument dishonored by non-payment.*—The instrument is dishonored by non-payment when:

1. It is duly presented for payment and payment is refused or cannot be obtained; or
2. Presentment is excused and the instrument is overdue and unpaid.

§ 144. *Liability of person secondarily liable, when instrument dishonored.*—Subject to the provisions of this act, when the instrument is dishonored by non-payment, an immediate right of recourse to all parties secondarily liable thereon, accrues to the holder.

TIME OF MATURITY.—

§ 145. *Time of maturity.*—Every negotiable instrument is payable at the time fixed therein without grace. When the day of maturity falls upon Sunday or a holiday, the instrument is payable on the next succeeding business day. Instruments falling due or becoming payable on Saturday are to be presented for payment on the next succeeding business day, except that instruments payable on demand may, at the option of the holder, be presented for payment before twelve o'clock noon on Saturday when that entire day is not a holiday.

§ 146. *Time; how computed.*—Where the instrument is payable at a fixed period after date, after sight, or after the happening of a specified event, the time of payment is determined by excluding the day from which the time is to begin to run, and by including the date of payment.

PAYABLE AT BANK.—

§ 147. *Rule where instrument payable at bank.*—Where the instrument is made payable at a bank it is equivalent to an order to the bank to pay the same for the account of the principal debtor thereon.

PAYABLE IN DUE COURSE.—

§ 148. *What constitutes payment in due course.*—Payment is made in due course when it is made at or after the maturity of the instrument to the holder thereof in good faith and without notice that his title is defective.

Possession of the instrument is *prima facie* authority to demand payment. The maker or drawer has a duty to demand the production of the instrument before paying it. (*Loizeaux* v. *Fremder*, 123 Wis. 193.)

NOTICE OF DISHONOR.—

§ 160. *To whom notice of dishonor must be given.*—Except as herein otherwise provided, when a negotiable instrument has been dishonored by non-acceptance or non-payment, notice of dishonor must be given to the drawer and to each indorser, and any drawer or indorser to whom such notice is not given is discharged.

To hold an **accommodation indorser** he must be given notice of dishonor the same as any other indorser. (*Perry* v. *Taylor*, 148 N. C. 362.)

Where a note given to a **bank** for collection is dishonored, it is the duty of the bank to give notice to its customer. (*Shea* v. *Vahey*, 215 Mass. 80.)

Guarantors do not come under the rule requiring notice. (*Brown* v. *Curtiss*, 2 N. Y. 225.)

§ 161. *By whom given.*—The notice may be given by or on behalf of the holder, or by or on behalf of any party to the instrument who might be compelled to pay it to the holder, and who, upon taking it up, would have a right to reimbursement from the party to whom the notice is given.

"A notice by a **stranger** to the instrument is not sufficient." (*Lawrence* v. *Miller*, 16 N. Y. 235.)

§ 162. *Notice given by agent.*—Notice of dishonor may be given by an agent either in his own name or in the name of any party entitled to give notice, whether that party be his principal or not.

Banks having instruments for collection act as agents and have authority to receive and give notice on behalf of the holders of the instruments. (*Kelly* v. *Theiss*, 78 N. Y. S. 1050; *West River Bank* v. *Taylor*, 34 N. Y. 128.)

A **notary** who is an agent for the owner of a negotiable instrument may give notice even though acting in his official capacity. (*Lawrence* v. *Miller*, 16 N. Y. 235.)

§ 163. *Effect of notice given on behalf of holder.*—Where notice is given by or on behalf of the holder, it enures for the benefit of all subsequent holders and all prior parties who have a right of recourse against the party to whom it is given.

A **holder** need not give notice to anyone but his immediate indorser. (*West River Bank* v. *Taylor*, 34 N. Y. 128.)

§ 164. *Effect where notice is given by party entitled thereto.*—Where notice is given by or on behalf of a party entitled to give notice, it enures for the benefit of the holder and all parties subsequent to the party to whom notice is given.

§ 165. *When agent may give notice.*—Where the instrument has been dishonored in the hands of an agent, he may either himself give notice to the parties liable thereon, or he may give notice to his principal. If he give notice to his principal, he must do so within the same time as if he were the holder, and the principal, upon the receipt of such notice, has himself the same time for giving notice as if the agent had been an independent holder.

Undue delay by an agent in giving notice to his principal discharges prior indorsers. (*Rosson* v. *Carroll*, 90 Tenn. 90.)

A **bank** receiving an instrument for collection fulfils its duty to the depositor by giving proper notice of dishonor in time to enable its customer to give notice to prior indorsers. (*Brill* v. *Jefferson Bank*, 159 App. Div. [N. Y.] 461.)

§ 166. *When notice sufficient.*—A written notice need not be signed, and an insufficient written notice may be supplemented and validated by verbal communication. A misdescription of the instrument does not vitiate the notice unless the party to whom the notice is given is in fact misled thereby.

§ 167. *Form of notice.*—The notice may be in writing or merely oral, and may be given in any terms which sufficiently identify the instrument, and indicate that it has been dishonored by non-acceptance or non-payment. It may in all cases be given by delivering it personally or through the mails.

Sufficient description generally is name of maker, date, amount, when and where payable.

Notice over telephone is sufficient. (*Am. Nat. Bank* v. *Nat. Fertilizer Co.*, 125 Tenn. 328.)

§ 168. *To whom notice may be given.*—Notice of dishonor may be given either to the party himself or to his agent in that behalf.

§ 169. *Notice where party is dead.*—When any party is dead, and his death is known to the party giving notice, the notice must be given to a personal representative, if there be one, and if with reasonable diligence he can be found. If there be no personal representative, notice may be sent to the last residence or last place of business of the deceased.

§ 170. *Notice to partners.*—Where the parties to be notified are partners, notice to any one partner is notice to the firm, even though there has been a dissolution.

§ 171. *Notice to persons jointly liable.*—Notice to joint parties who are not partners must be given to each of them, unless one of them has authority to receive such notice for the others.

§ 172. *Notice to bankrupt.*—Where a party has been adjudged a bankrupt or an insolvent, or has made an assignment for the benefit of creditors, notice may be given either to the party himself or to his trustee or assignee.

§ 173. *Time within which notice must be given.*—Notice may be given as soon as the instrument is dishonored; and unless delay is excused as hereinafter provided, must be given within the times fixed by this act.

§ 174. *Where parties reside in same place.*—Where the person giving and the person to receive notice reside in the same place, notice must be given within the following times:

1. If given at the place of business of the person to receive notice, it must be given before the close of business hours on the day following;
2. If given at his residence, it must be given before the usual hours of rest on the day following;
3. If sent by mail, it must be deposited in the post-office in time to reach him in usual course on the day following.

§ 175. *Where parties reside in different places.*—Where the person giving and the person to receive notice reside in different places, the notice must be given within the following times:

1. If sent by mail, it must be deposited in the post-office in time to go by mail the day following the day of dishonor, or if there be no mail at a convenient hour on that day, by the next mail thereafter.
2. If given otherwise than through the post-office, then within the time that notice would have been received in due course of mail, if it had been deposited in the post-office within the time specified in the last subdivision.

Notice is not good where there is delay due to **insufficient postage.** (*First Nat. Bank* v. *Miller*, 139 Wis. 126.)

§ 176. *When sender deemed to have given due notice.*—Where notice of dishonor is duly addressed and deposited in the post-office, the sender is deemed to have given due notice, notwithstanding any miscarriage in the mails.

§ 177. *Deposit in post-office; what constitutes.*—Notice is deemed to have been deposited

in the post-office when deposited in any branch post-office or in any letter-box under the control of the Post-Office Department.

§ 178. *Notice to subsequent party; time of.*—Where a party receives notice of dishonor, he has, after the receipt of such notice, the same time for giving notice to antecedent parties that the holder has after the dishonor.

§ 179. *Where notice must be sent.*—Where a party has added an address to his signature, notice of dishonor must be sent to that address; but if he has not given such address, then the notice must be sent as follows:

1. Either to the post-office nearest to his place of residence, or to the post-office where he is accustomed to receive his letters; or

2. If he live in one place, and have his place of business in another, notice may be sent to either place; or

3. If he is sojourning in another place, notice may be sent to the place where he is so sojourning.

But where the notice is actually received by the party within the time specified in this act, it will be sufficient, though not sent in accordance with the requirements of this section.

§ 180. *Waiver of notice.*—Notice of dishonor may be waived, either before the time of giving notice has arrived or after the omission to give due notice, and the waiver may be express or implied.

§ 181. *Whom affected by waiver.*—Where the waiver is embodied in the instrument itself, it is binding upon all parties; but where it is written above the signature of an indorser, it binds him only.

§ 182. *Waiver of protest.*—A waiver of protest, whether in the case of a foreign bill of exchange or other negotiable instrument, is deemed to be a waiver not only of a formal protest, but also of presentment and notice of dishonor.

§ 183. *When notice is dispensed with.*—Notice of dishonor is dispensed with when, after the exercise of reasonable diligence, it cannot be given to or does not reach the parties sought to be charged.

Reasonable diligence is all that is required under the law, which does not demand unusual effort to give notice of dishonor. (*Bank of Port Jefferson* v. *Darling*, 91 Hun 236.) Reliance on directory only is not sufficient to constitute due diligence. (*Bacon* v. *Harms*, 137 N. Y. 379.) Where a holder does not know or cannot find the address of the maker, it is his duty to inquire of the other parties to an instrument. (*University Press* v. *Williams*, 48 App. Div. [N. Y.] 190.)

§ 184. *Delay in giving notice; how excused.*—Delay in giving notice of dishonor is excused when the delay is caused by circumstances beyond the control of the holder and not imputable to his default, misconduct or negligence. When the cause of delay ceases to operate, notice must be given with reasonable diligence.

§ 185. *When notice need not be given to drawer.*—Notice of dishonor is not required to be given to the drawer in either of the following cases:

1. Where the drawer and drawee are the same person;

2. Where the drawee is a fictitious person or a person not having capacity to contract;

3. Where the drawer is the person to whom the instrument is presented for payment;

4. Where the drawer has no right to expect or require that the drawee or acceptor will honor the instrument;

5. Where the drawer has countermanded payment.

§ 186. *When notice need not be given to indorser.* Notice of dishonor is not required to be given to an indorser in either of the following cases:

1. Where the drawee is a fictitious person or a person not having capacity to contract, and the indorser was aware of the fact at the time he indorsed the instrument;

2. Where the indorser is the person to whom the instrument is presented for payment;

3. Where the instrument was made or accepted for his accommodation.

§ 187. *Notice of non-payment where acceptance refused.*—Where due notice of dishonor by non-acceptance has been given, notice of a subsequent dishonor by non-payment is not necessary, unless in the meantime the instrument has been accepted.

§ 188. *Effect of omission to give notice of non-acceptance.*—An omission to give notice

of dishonor by non-acceptance does not prejudice the rights of a holder in due course subsequent to the omission.

§ 189. *When protest need not be made; when must be made.*—Where any negotiable instrument has been dishonored it may be protested for non-acceptance or non-payment, as the case may be; but protest is not required, except in the case of foreign bills of exchange.

DISCHARGE.—

§ 200. *Instrument; how discharged.*—A negotiable instrument is discharged:

1. By payment in due course by or on behalf of the principal debtor;
2. By payment in due course by the party accommodated, where the instrument is made or accepted for accommodation;
3. By the intentional cancellation thereof by the holder;
4. By any other act which will discharge a simple contract for the payment of money;
5. When the principal debtor becomes the holder of the instrument at or after maturity in his own right.

§ 201. *When persons secondarily liable on, discharged.*—A person secondarily liable on the instrument is discharged:

1. By any act which discharges the instrument;
2. By the intentional cancellation of his signature by the holder;
3. By the discharge of a prior party;
4. By a valid tender of payment made by a prior party;
5. By a release of the principal debtor, unless the holder's right of recourse against the party secondarily liable is expressly reserved;
6. By any agreement binding upon the holder to extend the time of payment or to postpone the holder's right to enforce the instrument, unless the right of recourse against such party is expressly reserved.

§ 202. *Right of party who discharges instrument.*—Where the instrument is paid by a party secondarily liable thereon, it is not discharged; but the party so paying it is remitted to his former rights as regards all prior parties, and he may strike out his own and all subsequent indorsements, and again negotiate the instrument, except:

1. Where it is payable to the order of a third person, and has been paid by the drawer; and
2. Where it was made or accepted for accommodation, and has been paid by the party accommodated.

§ 203. *Renunciation by holder.*—The holder may expressly renounce his rights against any party to the instrument, before, at or after its maturity. An absolute and unconditional renunciation of his rights against the principal debtor made at or after the maturity of the instrument, discharges the instrument. But a renunciation does not affect the rights of a holder in due course without notice. A renunciation must be in writing, unless the instrument is delivered up to the person primarily liable thereon.

§ 204. *Cancellation; unintentional; burden of proof.*—A cancellation made unintentionally, or under a mistake, or without the authority of the holder, is inoperative; but where an instrument or any signature thereon appears to have been canceled the burden of proof lies on the party who alleges that the cancellation was made unintentionally, or under a mistake or without authority.

§ 205. *Alteration of instrument; effect of.*—Where a negotiable instrument is materially altered without the assent of all parties liable thereon, it is avoided, except as against a party who has himself made, authorized or assented to the alteration and subsequent indorsers. But when an instrument has been materially altered and is in the hands of a holder in due course, not a party to the alteration, he may enforce payment thereon according to its original tenor.

§ 206. *What constitutes a material alteration.*—Any alteration which changes:

1. The date;
2. The sum payable, either for principal or interest;
3. The time or place of payment;
4. The number or the relations of the parties;
5. The medium or currency in which payment is to be made;

Or which adds a place of payment where no place of payment is specified, or any other change or addition which alters the effect of the instrument in any respect, is a material alteration.

BILLS OF EXCHANGE.—

§ 210. *Bill of exchange defined.*—A bill of exchange is an unconditional order in writing addressed by one person to another, signed by the person giving it, requiring the person to whom it is addressed to pay on demand or at a fixed or determinable future time a sum certain in money to order or to bearer.

§ 211. *Bill not an assignment of funds in hands of drawee..*—A bill of itself does not operate as an assignment of the funds in the hands of the drawee available for the payment thereof, and the drawee is not liable on the bill unless and until he accepts the same.

§ 212. *Bill addressed to more than one drawee.*—A bill may be addressed to two or more drawees jointly, whether they are partners or not; but not to two or more drawees in the alternative or in succession.

§ 213. *Inland and foreign bills of exchange.*—An inland bill of exchange is a bill which is, or on its face purports to be, both drawn and payable within the State. Any other bill is a foreign bill. Unless the contrary appears on the face of the bill, the holder may treat it as an inland bill.

§ 214. *When bill may be treated as promissory note.*—Where in a bill the drawer and drawee are the same person, or where the drawee is a fictitious person, or a person not having capacity to contract, the holder may treat the instrument, at his option, either as a bill of exchange or a promissory note.

§ 215. *Referee in case of need.*—The drawer of a bill and any indorser may insert thereon the name of a person to whom the holder may resort in case of need, that is to say, in case the bill is dishonored by non-acceptance or non-payment. Such person is called the referee in case of need. It is in the option of the holder to resort to the referee in case of need or not, as he may see fit.

ACCEPTANCE.—

§ 220. *Acceptance; how made, et cetera.*—The acceptance of a bill is the signification by the drawee of his assent to the order of the drawer. The acceptance must be in writing and signed by the drawee. It must not express that the drawee will perform his promise by any other means than the payment of money.

§ 221. *Holder entitled to acceptance on face of bill.*—The holder of a bill presenting the same for acceptance may require that the acceptance be written on the bill, and if such request is refused, may treat the bill as dishonored.

§ 222. *Acceptance by separate instrument.*—Where an acceptance is written on a paper other than the bill itself, it does not bind the acceptor, except in favor of a person to whom it was shown and who, on the faith thereof, receives the bill for value.

§ 223. *Promise to accept; when equivalent to acceptance.*—An unconditional promise in writing to accept a bill before it is drawn is deemed an actual acceptance in favor of every person who, upon the faith thereof, receives the bill for value.

§ 224. *Time allowed drawee to accept.*—The drawee is allowed twenty-four hours after presentment in which to decide whether or not he will accept the bill; but the acceptance if given dates as of the day of presentation.

§ 225. *Liability of drawee retaining or destroying bill.*—Where a drawee to whom a bill is delivered for acceptance destroys the same, or refuses within twenty-four hours after such delivery, or within such other period as the holder may allow, to return the bill accepted or non-accepted to the holder, he will be deemed to have accepted the same.

§ 226. *Acceptance of incomplete bill.*—A bill may be accepted before it has been signed by the drawer, or while otherwise incomplete, or when it is overdue, or after it has been dishonored by a previous refusal to accept, or by non-payment. But when a bill payable after sight is dishonored by non-acceptance and the drawee subsequently accepts it, the holder, in the absence of any different agreement, is entitled to have the bill accepted as of the date of the first presentment.

§ 227. *Kinds of acceptances.*—An acceptance is either general or qualified. A general acceptance assents without qualification to the order of the drawer. A qualified acceptance in express terms varies the effect of the bill as drawn.

§ 228. *What constitutes a general acceptancy.*—An acceptance to pay at a particular place is a general acceptance unless it expressly states that the bill is to be paid there only and not elsewhere.

§ 229. *Qualified acceptance.*—An acceptance is qualified which is:

1. Conditional, that is to say, which makes payment by the acceptor dependent on the fulfillment of a condition therein stated;

2. Partial, that is to say, an acceptance to pay part only of the amount for which the bill is drawn;

3. Local, that is to say, an acceptance to pay only at a particular place;

4. Qualified as to time;

5. The acceptance of some one or more of the drawees, but not of all.

§ 230. *Rights of parties as to qualified acceptance.*—The holder may refuse to take a qualified acceptance, and if he does not obtain an unqualified acceptance, he may treat the bill as dishonored by non-acceptance. Where a qualified acceptance is taken, the drawer and indorsers are discharged from liability on the bill, unless they have expressly or impliedly authorized the holder to take a qualified acceptance, or subsequently assent thereto. When the drawer or an indorser receives notice of a qualified acceptance, he must within a reasonable time express his dissent to the holder, or he will be deemed to have assented thereto.

PRESENTMENT FOR ACCEPTANCE.—

§ 240. *When presentment for acceptance must be made.*—Presentment for acceptance must be made:

1. Where the bill is payable after sight or in any other case where presentment for acceptance is necessary in order to fix the maturity of the instrument; or

2. Where the bill expressly stipulates that it shall be presented for acceptance; or

3. Where the bill is drawn payable elsewhere than at the residence or place of business of the drawee.

In no other case is presentment for acceptance necessary in order to render any party to the bill liable.

§ 241. *When failure to present releases drawer and indorser.*—Except as herein otherwise provided, the holder of a bill which is required by the next preceding section to be presented for acceptance must either present it for acceptance or negotiate it within a reasonable time. If he fails to do so, the drawer and all indorsers are discharged.

§ 242. *Presentment; how made.*—Presentment for acceptance must be made by or on behalf of the holder at a reasonable hour, on a business day, and before the bill is overdue, to the drawee or some person authorized to accept or refuse acceptance on his behalf; and

1. Where a bill is addressed to two or more drawees who are not partners, presentment must be made to them all, unless one has authority to accept or refuse acceptance for all, in which case presentment may be made to him only;

2. Where the drawee is dead, presentment may be made to his personal representative;

3. Where the drawee has been adjudged a bankrupt or an insolvent, or has made an assignment for the benefit of creditors, presentment may be made to him or to his trustee or assignee.

§ 243. *On what days presentment may be made.*—A bill may be presented for acceptance on any day on which negotiable instruments may be presented for payment under the provisions of sections one hundred and thirty-two and one hundred and forty-five of this act. When Saturday is not otherwise a holiday, presentment for acceptance may be made before twelve o'clock noon on that day.

§ 244. *Presentment when time is insufficient.*—Where the holder of a bill drawn payable elsewhere than at the place of business or the residence of the drawee has not time with the exercise of reasonable diligence to present the bill for acceptance before presenting it for payment on the day that it falls due, the delay caused by presenting the bill for acceptance before presenting it for payment is excused and does not discharge the drawers and indorsers.

§ 245. *Where presentment is excused.*—Presentment for acceptance is excused and a bill may be treated as dishonored by non-acceptance in either of the following cases:

1. Where the drawee is dead or has absconded, or is a fictitious person or a person not having capacity to contract by bill;

2. Where after the exercise of reasonable diligence, presentment cannot be made;

3. Where, although presentment has been irregular, acceptance has been refused on some other ground.

WHEN DISCHARGED BY NON-ACCEPTANCE.—

§ 246. *When discharged by non-acceptance.*—A bill is dishonored by non-acceptance:

1. When it is duly presented for acceptance, and such an acceptance as is prescribed by this act is refused or cannot be obtained; or

2. When presentment for acceptance is excused and the bill is not accepted.

§ 247. *Duty of holder where bill not accepted.*—Where a bill is duly presented for acceptance and is not accepted within the prescribed time, the person presenting it mtus treat the bill as dishonored by non-acceptance or he loses the right of recourse against the drawer and indorsers.

§ 248. *Rights of holder where bill not accepted.*—When a bill is dishonored by non-acceptance, an immediate right of recourse against the drawers and indorsers accrues to the holder, and no presentment for payment is necessary.

PROTEST.—

§ 260. *In what cases protest necessary.*—Where a foreign bill appearing on its face to be such is dishonored by non-acceptance, it must be duly protested for non-acceptance, and where such a bill which has not previously been dishonored by non-acceptance is dishonored by non-payment, it must be duly protested for non-payment. If it is not so protested, the drawer and indorsers are discharged. Where a bill does not appear on its face to be a foreign bill, protest thereof in case of dishonor is unnecessary.

§ 261. *Protest; how made.*—The protest must be annexed to the bill, or must contain a copy thereof, and must be under the hand and seal of the notary making it, and must specify:

1. The time and place of presentment;
2. The fact that presentment was made and the manner thereof;
3. The cause or reason for protesting the bill;
4. The demand made and the answer given, if any, or the fact that the drawee or acceptor could not be found.

§ 262. *Protest; by whom made.*—Protest may be made by:

1. A notary public; or
2. By any respectable resident of the place where the bill is dishonored, in the presence of two or more creditable witnesses.

§ 263. *Protest; when to be made.*—When a bill is protested, such protest must be made on the day of its dishonor, unless delay is excused as herein provided. When a bill has been duly noted, the protest may be subsequently extended as of the date of the noting.

§ 264. *Protest; where made.*—A bill must be protested at the place where it is dishonored, except that when a bill drawn payable at the place of business or residence of some person other than the drawee, has been dishonored by non-acceptance, it must be protested for non-payment at the place where it is expressed to be payable, and no further presentment for payment to, or demand on, the drawee is necessary.

§ 265. *Protest both for non-acceptance and non-payment.*—A bill which has been protested for non-acceptance may be subsequently protested for non-payment.

§ 266. *Protest before maturity where acceptor insolvent.*—Where the acceptor has been adjudged a bankrupt or an insolvent, or has made an assignment for the benefit of creditors, before the bill matures, the holder may cause the bill to be protested for better security against the drawer and indorsers.

§ 267. *When protest dispensed with.*—Protest is dispensed with by any circumstances which would dispense with notice of dishonor. Delay in noting or protesting is excused when delay is caused by circumstances beyond the control of the holder and not imputable to his default, misconduct, or negligence. When the cause of delay ceases to operate, the bill must be noted or protested with reasonable diligence.

§ 268. *Protest where bill is lost, et cetera.*—Where a bill is lost or destroyed, or is wrongly detained from the person entitled to hold it, protest may be made on a copy or written particulars thereof.

ACCEPTANCE FOR HONOR.—

§ 280. *When bill may be accepted for honor.*—Where a bill of exchange has been protested for dishonor by non-acceptance or protested for better security and is not overdue, any person not being a party already liable thereon may, with the consent of the holder, intervene and accept the bill supra protest for the honor of any party liable thereon or for the honor of the person for whose account the bill is drawn. The acceptance for honor may be for part only of the sum for which the bill is drawn; and where there has been an acceptance for honor for one party, there may be a further acceptance by a different person for the honor of another party.

§ 281. *Acceptance for honor; how made.*—An acceptance for honor supra protest must be in writing and indicate that it is an acceptance for honor, and must be signed by the acceptor for honor.

§ 282. *When deemed to be an acceptance for honor of the drawer.*—Where an acceptance for honor does not expressly state for whose honor it is made, it is deemed to be an acceptance for the honor of the drawer.

§ 283. *Liability of acceptor for honor.*—The acceptor for honor is liable to the holder and to all parties to the bill subsequent to the party for whose honor he has accepted.

§ 284. *Agreement of acceptor for honor.*—The acceptor for honor by such acceptance engages that he will on due presentment pay the bill according to the terms of his acceptance, provided it shall not have been paid by the drawee, and provided also that it shall have been duly presented for payment and protested for non-payment and notice of dishonor given to him.

§ 285. *Maturity of bill payable after sight; accepted for honor.*—Where a bill payable after sight is accepted for honor, its maturity is calculated from the date of the noting for non-acceptance and not from the date of the acceptance for honor.

§ 286. *Protest of bill accepted for honor, et cetera.*—Where a dishonored bill has been accepted for honor supra protest or contains a reference in case of need, it must be protested for non-payment before it is presented for payment to the acceptor for honor or referee in case of need.

§ 287. *Presentment for payment to acceptor for honor; how made.*—Presentment for payment to the acceptor for honor must be made as follows:

1. If it is to be presented in the place where the protest for non-payment was made, it must be presented not later than the day following its maturity;
2. If it is to be presented in some other place than the place where it was protested, then it must be forwarded within the time specified in section one hundred and seventy-five.

§ 288. *When delay in making presentment is excused.*—The provisions of section one hundred and forty-one apply where there is delay in making presentment to the acceptor for honor or referee in case of need.

PAYMENT FOR HONOR.—

§ 300. *Who may make payment for honor.*—Where a bill has been protested for non-payment, any person may intervene and pay its supra protest for the honor of any person liable thereon or for the honor of the person for whose account it was drawn.

§ 301. *Payment for honor; how made.*—The payment for honor supra protest in order to operate as such and not as a mere voluntary payment must be attested by a notarial act of honor, which may be appended to the protest or form an extension to it.

§ 302. *Declaration before payment for honor.* The notarial act of honor must be founded on a declaration made by the payer for honor, or by his agent in that behalf declaring his intention to pay the bill for honor and for whose honor he pays.

§ 303. *Preference of parties offering to pay for honor.* Where two or more persons offer to pay a bill for the honor of different parties, the person whose payment will discharge most parties to the bill is to be given the preference.

§ 304. *Effect on subsequent parties where bill is paid for honor.*—Where a bill has been paid for honor all parties subsequent to the party for whose honor it is paid are discharged, but the payer for honor is subrogated for, and succeeds to, both the rights and duties of the holder as regards the party for whose honor he pays and all parties liable to the latter.

§ 305. *Where holder refuses to receive payment supra protest.*—Where the holder of a bill refuses to receive payment supra protest, he loses his right of recourse against any party who would have been discharged by such payment.

§ 306. *Rights of payer for honor.*—The payer for honor, on paying to the holder the amount of the bill and the notarial expenses incidental to its dishonor, is entitled to receive both the bill itself and the protest.

BILLS IN A SET.—

§ 310. *Bills in sets constitute one bill.*—Where a bill is drawn in a set, each part of the set being numbered and containing a reference to the other parts, the whole of the parts constitute one bill.

§ 311. *Rights of holders where different parts are negotiated.*—Where two or more parts

of a set are negotiated to different holders in due course, the holder whose title first accrues is as between such holders the true owner of the bill. But nothing in this section affects the rights of a person who in due course accepts or pays the part first presented to him.

§ 312. *Liability of holder who indorses two or more parts of a set to different persons.*—Where the holder of a set indorses two or more parts to different persons he is liable on every such part, and every indorser subsequent to him is liable on the part he has himself indorsed, as if such parts were separate bills.

§ 313. *Acceptance of bills drawn in sets.*—The acceptance may be written on any part, and it must be written on one part only. If the drawee accepts more than one part, and such accepted parts are negotiated to different holders in due course, he is liable on every such part as if it were a separate bill.

§ 314. *Payment by acceptor of bills drawn in sets.*—When the acceptor of a bill drawn in a set pays it without requiring the part bearing his acceptance to be delivered up to him, and that part at maturity is outstanding in the hands of a holder in due course, he is liable to the holder thereon.

§ 315. *Effect of discharging one of a set.*—Except as herein otherwise provided, where any one part of a bill drawn in a set is discharged by payment or otherwise the whole bill is discharged.

PROMISSORY NOTES AND CHECKS.—

§ 320. *Promissory note defined.*—A negotiable promissory note within the meaning of this act is an unconditional promise in writing made by one person to another, signed by the maker, engaging to pay on demand or at a fixed or determinable future time a sum certain in money to order or to bearer. Where a note is drawn to the maker's own order, it is not complete until indorsed by him.

§ 321. *Check defined.*—A check is a bill of exchange drawn on a bank, payable on demand. Except as herein otherwise provided, the provisions of this act applicable to a bill of exchange payable on demand apply to a check.

§ 322. *Within what time a check must be presented.*—A check must be presented for payment within a reasonable time after its issue or the drawer will be discharged from liability thereon to the extent of the loss caused by the delay.

323. *Certification of check; effect of.*—Where a check is certified by the bank on which it is drawn the certification is equivalent to an acceptance.

§ 324. *Effect where the holder of check procures it to be certified.*—Where the holder of a check procures it to be accepted or certified the drawer and all indorsers are discharged from liability thereon.

§ 325. *When check operates as an assignment.*—A check of itself does not operate as an assignment of any part of the funds to the credit of the drawer with the bank, and the bank is not liable to the holder, unless and until it accepts or certifies the check.

§ 326. *Recovery of forged check.*—No bank shall be liable to a depositor for the payment by it of a forged or raised check, unless within one year after the return to the depositor of the voucher of such payment, such depositor shall notify the bank that the check so paid was forged or raised.

§ 330. *Negotiable instruments given for patent rights.*—A promissory note or other negotiable instrument, the consideration of which consists wholly or partly of the right to make, use or sell any invention claimed or represented by the vendor at the time of sale to be patented, must contain the words "given for a patent right" prominently and legibly written or printed on the face of such note or instrument above the signature thereto; and such note or instrument in the hands of any purchaser or holder is subject to the same defenses as in the hands of the original holder; but this section does not apply to a negotiable instrument given solely for the purchase price or the use of a patented article.

§ 331. *Negotiable instruments for a speculative consideration.*—If the consideration of a promissory note or other negotiable instrument consists in whole or in part of the purchase price of any farm product, at a price greater by at least four times than the fair market value of the same product at the time, in the locality, or of the membership and rights in an association, company or combination to produce or sell any farm product at a fictitious rate, or of a contract or bond to purchase or sell any farm product at a price greater by four times than the market value of the same product at the time in the locality, the words, "given for a speculative consideration," or other words

clearly showing the nature of the consideration, must be prominently and legibly written or printed on the face of such note or instrument above the signature thereof; and such note or instrument, in the hands of any purchaser or holder, is subject to the same defenses as in the hands of the original owner or holder.

§ 332. *How negotiable bonds are made non-negotiable.*—The owner or holder of any corporate or municipal bond or obligation (except such as are designated to circulate as money, payable to bearer), heretofore or hereafter issued in and payable in this State, but not registered in pursuance of any State law, may make such bond or obligation, or the interest coupon accompanying the same, non-negotiable, by subscribing his name to a statement indorsed thereon that such bond, obligation or coupon is his property; and thereon the principal sum therein mentioned is payable only to such owner or holder, or his legal representatives or assigns, unless such bond, obligation or coupon be transferred by indorsement in blank, or payable to bearer, or to order, with the addition of the assignor's place of residence.

Law of Partnerships

DEFINITION.—"A contract of partnership is one by which two or more persons agree to carry on a business for their common benefit, each contributing property or services, and having a community of interest in the profits. It is in effect a contract of mutual agency, each partner acting as a principal in his own behalf and as agent for his copartner." (*Karrick* v. *Hannaman*, 168 U. S. 328.)

FORMATION AND ELEMENTS.—

By Contract.—A partnership is the result of a contract which at common law may be oral or written. "There is no such thing as a partnership by implication of law. The relation *inter se* is founded in voluntary contract, and cannot exist independent of it." (*Wilson's Exrs.* v. *Cobb's Exrs.*, 28 N. J. Eq. 177.) The contract must be enforcible and contain all elements necessary to support a simple contract in so far as it relates to capacity of parties, consideration and purpose.

Purpose.—A partnership may be formed for any purpose agreed to by the parties which does not contravene the law. (*Sampson* v. *Shaw*, 101 Mass. 145.) A partnership formed for illegal purposes or carrying on a legal business in an illegal manner is not recognized by the courts and no assistance will be given to enforce its claims, compel members to account, or contribute for losses. (*McMullen* v. *Hoffman*, 174 U. S. 639.)

Community of Interest.—"In every partnership there is a community of interest, but every community of interest does not create a partnership. There must be a joint ownership of the partnership funds, as a joint right of control over them and also an agreement to share the profits and losses arising therefrom." (*Sodiker* v. *Applegate*, 24 W. Va. 411.) "Partnership involves community of interest in some lawful commerce or business for the conduct of which the parties are mutually agents for each other—but with general powers within the scope of the business; which powers they can restrict by agreement to the extent of making one the sole agent of the rest of the business." (*Brotherton* v. *Gilchrist*, 144 Mich. 274.)

Sharing Profits.—Sharing profits of a business raises a presumption that there is a partnership, which, however, is not conclusive. "The tendency of the modern authorities is toward the doctrine that the sharing of profits is evidence that he who shares them is a partner, but not conclusive evidence, the true test being whether there is such a participation in or sharing of the profits as to constitute the relation of principal and agent between the person taking the profits and those actually carrying on the business. The inten-

tion of the parties must control. The relation of partners is formed by contract, or by the acts of the parties which amount to a contract. If there is no partnership *inter se*, there can be none as to third parties, unless a party by his acts has put himself in such a position that he is estopped from denying that he is a partner." (*Johnson* v. *Rothschild*, 63 Ark. 518.)

Business in Common.—To have a partnership there must be merged into a common business the individual property, interests, rights, and powers of the associates so that they are coprincipals in the business. (*Bendell* v. *Hettrick*, 35 N. Y. Sup. Ct. 45; *Meserve* v. *Andrews*, 104 Mass. 360.)

Single Ventures.—Although a partnership can and may be formed for a single venture, in the absence of express agreement it is necessary to make inquiries to determine if a partnership exists, or whether there is not some other relation, as joint tenancy or tenancy in common. If the partners have contributed to a common fund from which purchases were made for the venture, a partnership will be inferred; otherwise not. (*Guibert* v. *Saunders*, 10 N. Y. St. 43; *Clark* v. *Sidway*, 142 U. S. 682.)

Farming on Shares.—"An agreement between two parties that one shall furnish a farm with a certain amount of teams and labor and the other shall manage the farm and give certain labor, the crops to be divided, does not constitute a partnership." (*Blue* v. *Leathers*, 15 Ill. 32.)

Share of Profits as Compensation.—In and of itself a share of the profits given as compensation does not create the relation of partnership in the absence of other elements, as a community of interest and rights as a partner. (*Grapel* v. *Hodges*, 112 N. Y. 419; *Gentry* v. *Singleton*, 128 Fed. 679.)

Sharing Profits and Losses.—"A mere agreement to share profits and losses does not constitute persons partners *inter se*." (*McDonald* v. *Matney*, 82 Mo. 358.) The other elements heretofore mentioned are necessary.

Formation by Estoppel.—The doctrine of estoppel is not applied very often in establishing the relation of partnership among the members themselves. It is, however, applicable in such cases where one has availed himself of the benefits of an apparent partnership and who then denies being a partner to to the injury of his copartner. (*Pierce* v. *Whitley*, 39 Ala. 172; *McStea* v. *Matthews*, 50 N. Y. 166.)

PARTNERSHIP RELATIONS.—

As to Outside Parties.—Persons who as a result of contract become partners among themselves are considered and held as partners as to third parties. "A partnership, as to third persons, can only arise either by contract between the parties themselves, by implication of law arising from a contract which does not make them partners as to each other but does make them partners as to third persons, or by some act or declaration of the partners by which third persons are reasonably led to suppose that the partnership exists." (*Ernstein* v. *Gourdin*, Fed. Case No. 4320.)

By Estoppel.—A person although not a partner in fact will be held liable as one where he held himself out as a partner so that others were led to deal with him. "The theory upon which such a liability arises is that persons who hold themselves out to the world as partners by dealing in such a manner as to create the appearance of partnership to the injury of innocent third parties, are estopped from denying that their actual relation is not what their acts would seem to indicate it to be." (*Clark* v. *Rumsey*, 59 N. Y. App. Div. 435.)

Dormant Partner.—A dormant partner is one whose connection with the firm is unknown to the general public and who takes no active interest in the

management. The relation is the result of contract and on retirement he need not give notice to trade creditors or the public to escape liability.

Partnership Property.—All property contributed by partners or subsequently acquired becomes firm property, as well as all profits accrued during the operation of the business. (*Wilson* v. *Cobb*, 29 N. J. Eq. 361.)

Real Estate.—Real estate contributed by one of the partners becomes partnership property. Where such property is purchased with partnership funds it is firm property even if title is taken in the name of one partner only, who then holds it as a constructive trustee. "Real estate purchased with partnership funds for partnership uses, though the title be taken in the name of one partner, is in equity treated as personal property, so far as is necessary to pay the debts of the partnership and adjust the equities of the partners." (*Shanks* v. *Klein*, 104 U. S. 18.)

RIGHTS AND LIABILITIES—1. AS TO PARTNERS.—

Trust Relations.—The partnership relation is one requiring utmost good faith in the dealings of the partners among themselves during the continuance of the partnership. This trust relation extends from the very first negotiation leading to the formation of the partnership to the time for dissolution. (*Butler* v. *Prentice*, 158 N. Y. 49.)

Capital of the Firm.—The capital of the firm consists of what is contributed by the members, which becomes firm property, and any profits earned less the liabilities due creditors.

Advances and Loans.—In the absence of agreement the sums contributed by partners beyond their capital investment are treated as loans and advances for which they are entitled to be reimbursed. (*Topping* v. *Paddock*, 92 Ill. 92.)

Interest.—Interest does not accrue to partners on their balances until after the balance is struck and then only by agreement. A partner's capital does not bear interest unless expressly agreed on by the partners.

Interest on Advances.—The modern rule on this subject is that a partner who has made a cash loan to his firm over and above his capital requirement is entitled to interest at the legal rate without an express agreement with his copartners. (*Rodgers* v. *Clement*, 162 N. Y. 422; *Winchester* v. *Glazier*, 152 Mass. 316.)

Management.—In the absence of agreement, every partner is entitled to a share in the management of the business and in case of disagreement the majority governs. (*Livingston* v. *Lynch*, 4 Johns Ch. 573.)

Books of Account.—The partnership books of account should be kept at the firm's place of business, accessible to each partner, and entries made by anyone will be construed as conclusive as to him. Where all partners have access to the books they will be deemed accurate. The correctness of books kept by one partner can be questioned by another. Any of these presumptions may be rebutted by the parties. (*Tallmadge* v. *Penoyer*, 35 Barb. [N. Y.] 120.)

Statement of Accounts.—"Statements of account, whether taking the form of periodical balances on the firm's books or of formal documents interchanged among the partners, are generally conclusive upon the partners, unless impeachable because of fraud or mutual mistake. It is the duty of each partner to examine such accountings and complain promptly of any mistakes therein. Failure to do this and consequent acquiescence in the correctness of the statements operate ordinarily as a bar to any subsequent claim inconsistent with them." (30 Cyc. 448.)

Reimbursement for Expense.—A partner is entitled to reimbursement for expenditures made by him on behalf of the firm.

Salary and Services.—Unless agreed to by the partners the members are not entitled to salary, and where no agreement exists to the contrary they must devote their entire time and effort to partnership affairs.

Sharing Profits.—In the absence of agreement the partners share profits equally regardless of the inequality of capital and services contributed by them. (*Evans* v. *Warner*, 20 N. Y. App. Div. 230; *Kimberly* v. *Arms*, 129 U. S. 512.)

Conflict of Interests—Partner Dealing with Outsiders.—By reason of the relation of partnership requiring a partner to devote himself personally to the purposes of the firm, the courts scrutinize carefully the transactions of a partner in his individual capacity with outside parties and will compel the partner to account to the firm for all profit arising from such transactions if the partner's personal interest and those of the firm are in conflict. (*Bloom* v. *Lofgren*, 64 Minn. 1.)

Transactions Prohibited.—A partner cannot use partnership funds to pay personal debts, gain secret profits from the firm, or use firm property for individual benefit unless specifically authorized by the other partners.

Legal Action Between Partners.—One partner cannot sue another at law in regard to partnership matters until the partnership has been dissolved and there has been an accounting. (*Mitchell* v. *Tonkin*, 109 App. Div. [N. Y.] 165.)

2. AS TO OUTSIDE PARTIES.—

Partners' Status.—Each member of a partnership is an agent for all the others in the firm business (*Andrews* v. *Congar*, 131 U. S. 26) and "a partner is bound by the act of his copartner within the scope of the business of the firm, even if that act be fraudulent as between the partners." (*Capelle* v. *Hall*, Fed. Case No. 2391.)

Firm Name.—Where a partnership has adopted a firm name it will be bound only by transactions made and running in that name, unless they consent and ratify to the use of some other name. (*Palmer* v. *Stephens*, 1 Den. [N. Y.] 471.)

Buying and Selling.—Each partner has implied authority to bind the firm through contract for the purchase and sale of property usually dealt with in the course of the partnership business.

Sale of Real Estate.—Without express authority from the other members a partner has no authority to sell and convey real estate belonging to the firm (*Calder* v. *Creditors*, 47 La. Ann. 346), unless the real estate by agreement or by reason of the nature of the business is regarded as personalty (*Rooelsky* v. *Brown*, 92 Ala. 522).

Disposing of Entire Property.—"A transfer, by only one of several partners, of all the firm property, not made for partnership purposes, nor in payment of a creditor, nor as an assignment of firm property in the due course of business, nor as security for an antecedent debt, is void." (*Freemen* v. *Abramson*, 30 Misc. [N. Y.] 101.)

Releases and Settlements.—A partner has authority to release claims of the partnership and make settlement of transactions within the scope of the partnership business.

Negotiable Paper.—Within the scope of the firm's business a partner has authority to negotiate commercial paper for the partnership business. (*Silvermann* v. *Chase*, 90 Ill. 37; *Rumsey* v. *Briggs*, 139 N. Y. 323.) He has,

however, no authority to bind the firm by accommodation indorsement without their consent. (*Beach* v. *State Bank*, 2 Ind. 488.)

"The theory upon which one partner may bind his copartners by the use of the partnership name upon commercial paper, or other parol contracts, is that a confidence is reposed which amounts to a power or authority to each partner to bind the firm by contracts in matters relating to the business of the partnership. But this power is circumscribed and limited to contracts within the scope of the partnership business." (*Elliott* v. *Dudley*, 19 Barb. [N. Y.] 326.)

Suretyship and Guaranty.—One partner cannot bind the firm as guarantor or surety for a third person, without the assent or ratification of the other partners. (*Avery* v. *Rowall*, 59 Wis. 82.)

Arbitration.—A partner cannot bind his copartners by submission of partnership matters to arbitration. (*Karthaus* v. *Yllasy Ferrer*, 26 U. S. 222.)

Torts.—General rule: "A defendant cannot be held liable for the tortious act of another on the ground that they were partners, except upon proof that the partnership in fact existed at the time, and that the act was done in relation to the partnership business, with the knowledge and approval or ratification of such defendant, or that it was plainly for the benefit of the firm, and was committed in the usual and ordinary prosecution of the business which the partner committing it was accustomed to transact." (*Shapard* v. *Hynes*, 104 Fed. 45.)

RIGHTS AND REMEDIES OF CREDITORS.—

Marshaling of Assets.—This refers to the application of assets to the liquidation of debts of the firm and the individual members thereof, and applies where firm assets and individual assets of its members are before a court of equity for distribution, as in the case of insolvency of the firm and of its members individually. (*United States* v. *Lewis*, 92 U. S. 618.) The **rule** then is that firm debts must be paid out of firm property, and private debts out of private property; and no resort can be had by the one class of creditors to the fund belonging to the other until their own fund has been first exhausted. (*Pahlman* v. *Graves*, 26 Ill. 405.)

Creditors of a partnership can look only to the surplus of the separate estate of the members of the firm after the payment of the separate debts, and separate creditors can seek indemnity only from the surplus of the joint fund after the satisfaction of joint creditors. (*McCulloh* v. *Dashiells Adm.*, 1 Har. & G. 96.)

Real Estate.—Real estate of the firm even though in the name of but one or more partners is treated as a firm asset available for liquidation of firm debts in preference to the claims of the individual partners. (*Standish* v. *Babcock*, 52 N. J. Eq. 628.)

Creditors of Individual Partners.—A creditor of an individual partner in seeking to satisfy his claim from partnership property is confined to the share of the partner in the firm assets after all firm liabilities are met. It is not any particular piece of property but an interest in the firm assets after the settlement of firm accounts, which is applicable to a partner's separate debts. (*Atwood* v. *Meredith*, 37 Miss. 635.)

DISSOLUTION.—

Retirement or Admission of Partner.—Under the common law the retirement or admission of a partner resulted in the creation of a new firm and a dissolution of the old one unless the partners agree in their partnership

contract that the admission or retirement of members shall not work a dissolution. (*Rand* v. *Wright*, 141 Ind. 226.)

Use of Firm Name.—The continuance of the use of a firm name after dissolution may be acquired by the remaining partners by purchase or agreement. It is, however, not an inherent right and in the absence of such agreement it is held that the continuing partners have no right to continue to use the firm name. (*Morgan* v. *Schuyler*, 79 N. Y. 490.)

Good-Will.—The good-will of a business is property capable of being sold. Generally it passes with a business and in the sale or retirement of a partner the good-will continues with the remaining members conducting the business and passes to them under the agreement of sale or continuance of the business even though no specific mention is made of the intangible asset. (*Steinfeld* v. *National Shirt Waist Co.*, *in re* good-will, see 20 Cyc. 1278.)

Liability of Retiring Partner.—A retiring partner remains liable for debts contracted before his retirement even though his copartners have agreed to assume the liabilities and discharge the obligations. (*Penn* v. *Fogler*, 182 Ill. 76.)

Notice by Retiring Partner.—A retiring partner is liable not only for debts contracted by the firm before his retirement but also for subsequent debts unless he has given notice of his retirement. That notice must be actual notice in the case of former creditors and constructive notice to the trade in general, which is done as a rule by sending letters or announcements to the former creditors and newspaper announcements to the trade in general.

Novation.—Novation is established and the retiring partner discharged of liability for debts of the firm where creditors, with knowledge of the continuing partner's agreement to assume the debts, enter into a totally new agreement with him entirely changing the nature of the debt. (*Harris* v. *Lindsay*, Fed. Case No. 6123; *Regester* v. *Dodge*, 61 How. Prac. 107.)

Death of Partner.—In the absence of agreement, death terminates the partnership and the surviving partner has the exclusive right to liquidate the affairs of the firm, but not the right to subject the estate of the deceased partner to any new obligations.

Rights of Widow and Heirs.—The interest of a deceased partner in partnership real estate descends to his heirs at law, subject to the debts of the partnership and the equities of the remaining partners, in accordance with real estate law, unless the partnership agreement treats the real estate as personal property by equitable conversion, in which case distribution follows the law of personalty.

Accounting and Settlement.—The surviving partner must account to the estate of the deceased partner for his interest in the firm at a fair valuation, and if he fails, he can be compelled to present such an accounting by the proper probate courts. (*Clausen* v. *Privogel*, 114 App. Div. [N. Y.] 455; *Leland* v. *Newton*, 102 Mass. 350.)

TERMINATION OF PARTNERSHIP.—

Partnership at Will.—A partnership at will is one in which no definite time or term is fixed and which may be terminated by a member at any time by giving notice to all the other partners.

Fixed Term.—A partnership is terminated by efflux of time where a fixed time is agreed upon by the partners. This may, however, be changed subsequently by mutual consent.

Death, Insanity, or Bankruptcy of Partner.—Dissolves partnership *ipso facto.*

Accounting.—On dissolution each partner is entitled to an accounting from each one of his other partners on all matters relating to partnership transactions. (*Lorch* v. *Hull*, 178 N. Y. 9; *Mellor* v. *Smither*, 114 Fed. 116.) In the absence of fraud or mistake an accounting and settlement between partners at the time of dissolution is binding on the partners and is a good defense in an action by any one to require further settlement. (*Wells* v. *Erstein*, 24 La. Ann. 317.)

THE UNIFORM PARTNERSHIP ACT.—The desirability of having uniform laws throughout the country, particularly in so far as they relate to business, is generally recognized. Many states have adopted a number of the uniform laws devised by the commissioners appointed for that purpose; the most generally known are the Uniform Negotiable Instruments Law and the Uniform Sales Act.

States and territories which have adopted the Uniform Partnership Act are as follows:

Alaska	Michigan	Tennessee
Idaho	Minnesota	Utah
Illinois	New Jersey	Virginia
Maryland	New York	Wisconsin
Massachusetts	Pennsylvania	Wyoming

Law of Agency

DEFINITION.—Briefly, an agent may be defined as "one who acts for, or in place of, another denominated the principal, in virtue of power or authority conferred by the latter, to whom an account must be rendered." (*Rowe* v. *Rand*, 111 Ind. 206.)

The relationship of agency is comprehensively defined by Mechem as: "A legal relation, founded upon the express or implied contract of the parties or created by law, by virtue of which one party, **the agent,** is employed and authorized to represent and act for the other, **the principal,** in business dealings with third persons."

An agent may be known as such or may be known under a distinctive title, as attorney, consignee, clerk, factor, etc.

OTHER SIMILAR RELATIONS.—Since the law differs as to agency, master and servant, independent contractor, licensee, and trustee, the distinctive features of each will be discussed.

Servant.—"The words 'agent and servant' are not wholly synonymous; both, however, relate to voluntary action under employment, and each expresses the idea of service. The service performed by a servant for his employer may not be inferior in degree to work done by an agent for his principal. A servant is a worker for another under an express or implied employment, so also is an agent, only he works, not only for, **but in the place of,** his principal." (*Reo* v. *Treadwell*, 69 Cal. 226.) The California Civil Code defines an agent as one who represents another in dealings with third persons and in No. 2295 defines a servant as one employed to render personal service entirely under the direction and control of the employer. While the relationship is similar and the cases not in harmony to produce a rule of universal application to differentiate between agent and servant, the distinction made by the California Civil Code is probably the best test. This may be summarized: An agent is employed to establish contractual relations between his principal and third persons, whereas a servant is not.

Independent Contractor.—A principal is liable for the acts of his agent while acting within the scope of his authority, whereas the acts of an independent contractor are his own for which he alone is responsible. The distinguishing feature lies in the retention and control of the means of carrying out the object of the relationship. If the employer retains the right of general control and management of the work, he makes the employee his agent, but if the employer leaves the choice of means and methods, he makes him an independent contractor. (*Lawrence* v. *Shipman*, 36 Conn. 586.)

Licensee.—A licensee is one receiving permission to do a certain thing for which the one granting the permission is not responsible. *Murphy* v. *Emigration Com.* (28 N. Y. 134) holds: "In some cases permission is granted by one person to another which under the conditions may amount to a mere license to do some act or acts on his own responsibility."

Trusteeship.—While an agent and a trustee are similar in that they hold a fiduciary relation to their principal and *cestui que trust*, respectively, the essential difference lies in the title to property. In a trusteeship the title lies in the trustee but in agency the title remains in the principal.

WHO MAY BE A PRINCIPAL.—"Any person capable of transacting his own business may appoint an agent to act in his behalf in all ordinary affairs of life." (*Caley* v. *Morgan*, 114 Ind. 350.) A person must be *sui juris*, i.e., capable of entering into an enforcible contract before he can become a principal. There are certain personal affairs which cannot be delegated to an agent, such as contracting a marriage or making a will. Citizens of nations at war with one another cannot become principal or agent of one another.

WHO MAY BE AN AGENT.—The general rule is that anyone may act as an agent except an insane person incapable of following instructions or of exercising discretion, or an infant of tender years. A person having interests incompatible with those of the principal is disqualified under the law to take the agency.

METHOD OF CREATING AGENCY.—Agency may be created by contract, express or implied, estoppel, operation of law and necessity, and ratification.

Creation by Express Contract.—To establish the relation of agency by contract, all the elements necessary to support a simple executory contract are necessary, which are as follows:

1. Mutual assent—must be contract of employment, express or implied.
2. Consideration is required in executory contract to act as agent.
3. Intention—implied or express.
4. Notification—agent must be notified before appointment becomes effective.

In general, no particular form or words are necessary so long as the context fulfils the above requirements.

In certain instances the statute law requires certain formalities, as in writing or under seal. The purpose of the agency governs in such cases and rests on the principle that an agent's authority must be of the same degree as the acts he is called on to do. If he is to execute sealed instruments his authority must be under seal, likewise if the law (Statute of Frauds, for instance) requires him to execute contracts in writing, his authority or appointment must be in writing.

Creation by Implied Contract.—Probably the most common method of creating agencies is where the relationship is implied from the surrounding

facts and circumstances, as where, for instance, from the course or previous dealings, habits, or actions of the principal it is implied that another is his agent. An agent under an implied contract is a real agent with all the rights and liabilities of an agent in his relations with his principal and outside parties.

Creation by Estoppel.—An agency created under the doctrine of estoppel is one implied under the law for the protection of outside parties wherein the principal is held responsible for the acts of the apparent agent. The agent in fact is no agent at all and as to the principal he has no rights. The elements necessary to establish an agency by estoppel are:

1. A false holding out by a person that he is the principal.
2. Reliance by third parties on such holding out.
3. Parting with value by the third party as a result of the actions indicated in (1) and (2).

The false holding out may be done by words, acts, past dealings, particular circumstances, or any combination of them which would lead a reasonably prudent person to believe that the facts were true. Parting with value means giving up any legal right whereby his position is changed. The rule is that, "where one has reasonably and in good faith been led to believe from the appearance of authority which a principal permits his agent to have and because of such belief has in good faith dealt with the agent, the principal will not be allowed to deny the agency, to the prejudice of one so dealing." (*Columbia Mills Co.* v. *Nat. Bank of Commerce*, 52 Minn. 224.)

Creation by Operation of Law.—During the continuance of certain legal relations between parties the courts imply that an agency exists. Such relations are in:

1. **Partnership,** where each partner is an agent for the firm and can bind the firm within the sphere of activities usually found in such a business. In a trading firm a partner may bind the firm to contracts of the business, and issue commercial paper in the firm name. However, in a non-trading firm, such as a partnership of professional men, accountants, lawyers, etc., a partner's agency for the firm is more restricted. For instance, he never has authority, unless expressly given to him by the other parties, to issue commercial paper.

2. **Husband and wife,** where the law implies that the wife is the agent of the husband to purchase necessities of life for herself and children. These necessities are such food, clothing, and articles as are reasonably required for the health and comfort of persons in the station of life of the husband and wife.

Creation by Ratification.—An unauthorized act of a person in behalf of another may be ratified by such other, thereby constituting the person an agent from the beginning. It is "the voluntary assumption, on full information, of an unauthorized act or agreement by the party in whose behalf it was done or made." (*St. Louis Gunning Adv. Co.* v. *Wanamaker*, 115 Mo. App. 270.) Such ratification is equivalent to original authority of the agent and confirms this act but does not change or make a new contract.

In ratification there must be some authority which the agent has exceeded. The act must have been done in the name of a known or ascertainable principal who exists. The principal must have been competent as such when the act was done and must have full knowledge of all material elements of the act before ratification is effective. The act or transaction must be ratified in its entirety and cannot be accepted in part and rejected in part without the consent of the party with whom the contract was made.

To make ratification effective it must be communicated and must follow the general rule required to give the agent his original authority. "The ratification of a contract requires the same observance of the same formalities as the making of a valid contract." (*Acuna* v. *Ilailo*, 2 Philippine 217.)

Ratification does not equal authority in the following. Third parties are not bound by the act of the agent in such cases until the act is ratified by the principal. After an unauthorized contract is made by an agent, exceeding his authority, and outside parties have acquired an interest in the subject matter, they are protected in their interest provided it was obtained without knowledge on their part of the unauthorized contract, and before ratification.

Creation by Adoption.—An act by an ostensible agent may be adopted by a principal as his act, thereby obtaining the rights and incurring the liabilities of the relationship of principal and agent.

Distinction Between Ratification and Adoption.—"In their primary significance, there is a manifest distinction between 'adoption' and 'ratification.' The one signifies to take and receive as one's own that with reference to which there existed no prior relation either colorable or otherwise; while the other is a confirmation, approval or sanctioning of a previous act, or an act done in the name or on behalf of the party ratifying, without sufficient or legal authority, that is to say, the confirmation of a voidable act." (*Schreyer* v. *Turner Flouring Mills Co.*, 29 Or. 1.)

REPUDIATION.—A principal must have full knowledge before he can be deemed to ratify the acts of his agent. If he wishes to repudiate the acts of an agent who has exceeded his authority, he must do it with reasonable promptness. "The cases abound in such remarks as that a principal must disavow the conduct of an agent done in excess of authority, in a reasonable time after getting notice of it, on pain of being deemed to have assented to the conduct." (*St. Louis Gunning Adv. Co.* v. *Wanamaker*, 115 Mo. App. 270.) In case the act is that of a person having no authority at all as an agent, repudiation is not called for. "A failure to disavow the act of a mere volunteer who meddlingly assumes to act without authority, as the agent of another, will not constitute a ratification." (*Robbins* v. *Blanding*," 87 Minn. 246.)

KINDS OF AGENTS.—

General Agent.—One appointed or held out as such by his principal to conduct all of his business or all of a particular business. His authority is general and the principal is bound to outsiders by all the acts of such an agent within the scope of his authority, even though it is beyond the specific instructions of the agent.

Special Agent.—One appointed for a single act or specific purpose, limited by the restrictions imposed by the principal, who is bound only by acts of the agent expressly authorized by him. All persons dealing with a special agent must ascertain the extent of his authority and failure to do so is at their peril.

Public Agent.—Those who act for government, state, city, or other political subdivision of a nation.

Ostensible Agent.—"One whom the principal, either intentionally or by want of ordinary care, induces third persons to believe to be his agent, although he has not, either expressly or by implication conferred authority on him." (*Farmers etc. Bank* v. *Butchers etc. Bank*, 16 N. Y. 125.)

Joint Agents.—Two or more persons authorized to act together for another **are joint agents.** To bind the principal they must act together. The acts

of less than all are not binding on the principal unless specifically authorized by the principal.

Subagents.—A fundamental proposition in law is that a delegated authority cannot itself be delegated. For instance, a director of a corporation elected by stockholders cannot delegate his duties as director to another. Likewise, any other agent cannot delegate his authority to a subagent, unless specifically authorized, on the ground that agency is a personal trust calling for the exercise of skill and discretion on which the principal relies.

TERMINATION OF THE AGENCY.—The relation of agency may be terminated: (1) by acts of the parties, or (2) by operation of law.

1. **Acts of the Parties.**—
   - (a) **At will**—where no time limit or definite object is set forth.
   - (b) **Agreement**—the principal and agent may contract that the agency shall cease.
   - (c) **Expiration of the time** in the original contract of agency or the time of its subsequent extension.
   - (d) **Completion of the objects** of the agency as originally agreed upon.
   - (e) **Revocation of authority** by the principal, who may terminate the agency except where the agency is irrevocable.
   - (f) **Renunciation** of the agency by the agent.

In revocation and renunciation the principal and agent, respectively, are liable for damages for a breach of contract except where the other party contributes cause. In renunciation such cause would be the failure of the principal to furnish the place, tools, or the facilities, or in revocation would be where the agent became incapacitated or refused to do his duties.

2. **Operation of Law.**—The relation of agency may be terminated by operation of law by any one of the following acts:
   - (a) **Death** of principal or agent. The estate of neither party can be held for completion of performance or for subsequent earnings.
   - (b) **Insanity** of principal or agent.
   - (c) **Bankruptcy** of either party will terminate an agency relating to property of the one adjudicated bankrupt.
   - (d) **War** between nations terminates, with few exceptions, the relation of agency between the citizens of the respective countries at war.
   - (e) **Destruction** or loss of control of the subject matter of the agency; change of legal status of principal or agent brought about by operation of the civil or criminal law, as arrest, imprisonment of one of the parties, dissolution of corporation or partnership; or where the agent's interest becomes adverse to the principal.
   - (f) **Changes in the law** making the agency illegal, as where enactment of the prohibition law terminated agencies for the sale of wines, liquors, etc.

IRREVOCABLE AGENCY.—

Agency Coupled with an Interest.—When an agent has an interest of his own in the subject matter of the agency, the agency is irrevocable and he is said to have an agency coupled with an interest. "These are irrevocable by the act of the principal for they are founded upon sufficient consideration and created to subserve purposes in which another has an interest." (*Bonney* v. *Smith*, 17 Ill. 531.)

Change of Position of Agent.—Where an agent within the scope of his authority enters into contractual relations as agent with outside parties

whereby he would be personally liable, the agency is irrevocable, as for instance, if he personally warrants on proper authority goods sold for his principal who agreed to meet claims under such a warranty.

RELATION OF PRINCIPAL AND AGENT—1. DUTIES OF AGENT.—

Instructions.—"It is a well-established rule of law that an agent is bound to execute the orders of his principal whenever for a valuable consideration he has undertaken to perform them, whether reasonable or not, unless prevented by some unavoidable accident without default on his part, or unless the instructions require him to do an illegal or immoral act." (*Rectsherd* v. *St. Louis Accom. Bank*, 47 Mo. 181.)

Loyalty.—As the agency relation is of a fiduciary nature, utmost good faith is required of the agent, whose interest cannot become antagonistic to those of his principal, nor can he act for two parties of opposing interests without the consent of both parties. "The law is now well settled that the relationship of principal and agent is one involving confidence, and it is the duty of every agent to act with the most perfect good faith towards his principal, and not in any way to abuse the confidence reposed in him." (*Pommerende* v. *Bate*, 3 *Sask*. L. 51.)

Render Proper Accounts.—"It is elementary law that all profit made or advantage gained by an agent in the execution of his agency belongs to the principal and it is immaterial whether that advantage is the result of the performance or violation of the agent's duty." (*Wells* v. *Cochran*, 84 Nebr. 278.) "As to the duty of an agent, while acting for and on behalf of his principal, there can be no doubt. When the character and nature of the business in which he is employed requires it, he should keep full, accurate and regular accounts of all his transactions, of his payments and disbursements, and should render, at all proper times, an account thereof to his principal, without suppression, concealment or overcharge. This duty is incident to the relation, and arises from the nature of his employment." (*Gallup* v. *Merrill*, 40 Vt. 133.)

Keep Principal's Property Separate from His Own.—It is an important duty of an agent to keep separate and distinct from his own the property of his principal. If he fails to do so and loss of intermingled funds or property, his own and his principal's, results he is personally liable for such loss.

Skill and Diligence.—Competent skill as well as fidelity may be legally demanded of an agent, and for a deficiency in either he is responsible. (*Redfield* v. *Davis*, 6 Conn. 439.)

2. DUTIES OF THE PRINCIPAL.—

To Provide Facilities.—The primary duty of the principal is to provide proper facilities to carry out the purposes of the agency.

Reimbursement for Expenditures.—The principal is liable for reasonable disbursements or expenses incurred by the agent in good faith in carrying out the purpose of the agency. The agent has a particular lien for such expenses as well as for commissions on property of the principal coming into possession of the agent in the course of his employment.

Compensation.—The agent is entitled to the compensation agreed upon, or if no amount is stipulated the reasonable value of the service, or the usual compensation for such service as determined by custom or usage of the trade. This compensation may be salary, wages, or commissions. As a general rule, where the compensation is by way of salary or wages, the principal is liable whether he accepts the result of the labor or not. On the other hand,

the rights of the agent to commissions are not completed until the purpose of the agency is performed.

RELATION OF AGENT AND OUTSIDE PARTIES—1. DUTY OF AGENT.—

Implied Warranty of Authority.—A person who holds himself out as an agent impliedly warrants that he is such an agent. If anyone deals with him in good faith and finds that he has no such authority, the agent may be held personally as a principal.

Undisclosed Principal.—It is the duty of an agent to disclose his principal; if he fails to do so he will be held as a principal. (*Hamlin* v. *Abell*, 120 Mo. 188.) "It is a well recognized rule of law that where an agent conceals the fact of his agency and enters into a contract in his own name, he may be treated as a principal by the party with whom he deals and may be held liable on the contract to the same extent as if he were in fact a principal in interest." (*Whitney* v. *Woodmansee*, 15 Idaho 735.)

The outside party may elect to hold either the principal or the agent. The principal cannot be held where:

1. The outside party has conclusively decided to hold the agent only.
2. Where the contract is part of a negotiable instrument.
3. Where the contract is signed and sealed in the name of the third party and the agent only.

The rule of the law in these instances is that only the parties whose names are signed to the contract are bound.

2. PUBLIC AGENTS.—Public officers, i.e., officers of the nation, state, or any political subdivision, have only such authority as is vested in them by statute. If they exceed that authority they are personally liable. They are also personally liable for torts, omissions of duty, negligence, and wrongful acts even though done in the discharge of their duties.

RELATION OF PRINCIPAL TO THIRD PARTIES.—The acts of an agent within the scope of his authority are binding upon the principal if such principal is made known. "The maxim of *respondeat superior* is founded on the principle that he who expects to derive advantage from an act which is done by another for him must answer for any injury which another may sustain from it." (*Barker* v. *Chicago etc. R. Co.*, 243 Ill. 482.) This doctrine is not confined to the contractual relations entered into by the agent on behalf of his principal. It includes frauds of the agent, his negligence and torts committed while executing the purposes of the agency. The principal is not liable for torts committed by an agent outside the scope of his duties or authority.

Knowledge coming to the agent is notice to the principal. The knowledge or notice must apply to the purpose of the agency to be binding on the principal. Admissions made by an agent on matters pertaining to the agency may be proved against the principal as his own admissions.

Crimes committed by an agent are not chargeable against the principal even though committed by the agent while transacting the purpose of the agency, unless the principal directed or knowingly permitted the agent to commit the crimes.

DUTIES OF THIRD PARTIES.—Persons dealing with agents should inquire into the authority of the agent; failure to do so is at their peril. "Where the nature of the transactions with an agent shows that his power must necessarily be contained in a written document, persons dealing with

him are charged with the duty of inquiring as to the extent of his authority and can recover for no loss, resulting from their failure to discharge this duty." (2 C. J. Agency, citing *Thomas Gibson Co.* v. *Carlisle*, 3 Ohio S. & C. P. 27.)

AUTHORITY OF AN AGENT.—Acts of a person acting as an agent but without authority are not binding on the presumed principal. The agent alone can be held liable.

The **express authority** of an agent is that set forth specifically, written or oral, when the agency is created.

The **implied authority** is that which is necessary and usual to carry out the agency. "The implied powers and authority of an agent depend largely upon the circumstances in each case, and upon what is necessary or reasonable to enable him to effect the purpose of his agency." (*Nat. Bank of Republic* v. *Baltimore Old Town Bank*, 112 Fed. 726.)

"Direct authority will carry with it by implication of law such powers as are suitable and reasonably necessary to accomplish the intended purposes, although no secondary or incidental powers were mentioned between the principal and agent." (*Hacket* v. *Van Frank*, 105 Mo. App. 384.)

AUTHORITY OF AGENTS FOR SPECIAL PURPOSES.—The general rule is that an agent's authority must be of equal tenor as the acts he is required to do to carry out the purposes of the agency. Where the Statute of Frauds requires an agent's act to be in writing, his authority must be in writing. When the law requires the acts of the agent to be under seal, his authority must be under seal. Such cases are powers of attorney, execution of deeds, bonds, etc. In other cases oral authority is sufficient.

To Sell Real Estate.—Authority to sell real estate must be clear and specific and cannot be inferred. To convey title the agent must have authority under seal.

Negotiable Instruments.—"Authority to execute notes and bills of exchange must be express and special." (*Lafourche Transp. Co.* v. *Pugh*, 52 La. Ann. 1517.)

To Manage Business.—An agent appointed to manage his principal's business has implied powers necessary to carry on the business. Such an agent may make financial statements of the business, waive claims, compromise actions, modify contracts, rent or lease property, and hire employees. The limitations are that he must confine himself **to conducting the business** and cannot dispose of it nor can he make permanent improvements or alterations.

REQUISITES OF AGENT'S CONTRACTS—

Under Seal.—To be binding on his principal a sealed contract executed by an agent must clearly set forth that the contract and acts enumerated therein are those of the principal and not the agent and that the seal is the seal of the principal; otherwise the covenants will be construed as those of the agent. The instrument should be signed with the principal's name, followed preferably immediately by the signature of the agent setting forth the fact of agency as

John Jones,
By John Doe, his agent.

Simple Contract.—The care or precision required in sealed instruments does not apply with the same strictness to written contracts not requiring seals. Written contracts, however, should be in the name of the principal and signed by the agent in his representative capacity by signing his principal's name and his own as agent. (*Mears* v. *Morrison*, 1 Ill. 223.)

Law of Bailments

DEFINITION.—A bailment is "a contract by which goods are delivered by one person to another for a certain purpose, upon an express or implied promise by the bailee to return them to the bailor, or to deliver them to some one designated by him, after the purpose has been fulfilled. (*State* v. *Chew Muck You*, 20 Or. 215.)

NATURE AND ELEMENTS.—Bailment is a contractual relation in which there must be delivery and acceptance, i.e., lawful possession of some kind of personal property in existence which is to be returned in the same or some altered form.

Delivery of the property may be actual or constructive. (*Van Wagoner* v. *Buckley*, 148 App. Div. [N. Y.] 808; *Ex parte Fitz*, 9 Fed. Cases No. 4837.)

Acceptance.—Responsibilities of a bailee cannot be thrust upon a person without his consent. (*Van Wagoner* v. *Buckley*, 148 App. Div. [N. Y.] 808.) "The person who is sought to be charged must accept the property, because the relation is founded upon contract, and the duty and liability springing therefrom cannot be thrust upon one without his knowledge or consent." (*Bertig* v. *Norman*, 101 Ark. 75.)

Return of Property.—"The power to require the restoration of the subject of the agreement is an indelible incident of a contract of bailment." (*In re Columbus Buggy Co.*, 143 Fed. 859.)

BAILMENTS DISTINGUISHED FROM OTHER CONTRACTS.—

From Sales.—In sales title passes, whereas in bailment title remains in bailor. (*Sturm* v. *Baker*, 150 U. S. 312.) "If the identical thing delivered is to be returned, it is a bailment, and there is no transfer of title; but if the one to whom it is delivered may return another thing of the same kind, or an equivalent in the form of money, or otherwise, it will ordinarily constitute a sale and effect a change of title." (*Scott Min. etc. Co.* v. *Shultz*, 67 Kan. 605.)

If articles are delivered, work done on them, and the same articles are to be returned, it is a bailment. "Thus, where logs are delivered to be sawed into boards, or leather to be made into shoes, rags into paper, olives into oil, grapes into wine, wheat into flour, if the product of the identical articles delivered is to be returned to the original owner in a new form, it is said to be a bailment, and the title never vests in the manufacturer. If, on the other hand, the manufacturer is not bound to return the same wheat or flour or paper, but may deliver any other of equal value, it is said to be a sale or a loan, and the title to the thing delivered vests in the manufacturer." (*Laflin etc. Powder Co.* v. *Burkhardt*, 97 U. S. 110.)

From Conditional Sales.—"The most approved test lies in ascertaining whether there was a promise to pay for the goods. If so, as a general rule, the transaction will be declared a conditional sale rather then a bailment." (*Norton* v. *Fisher*, 113 Iowa 595.) Rental and instalment contracts of sale are regarded as conditional sales and not bailments. (*In re* Caldwell Mach. Co., 215 Fed. 428.) (*Smith* v. *Aldrich*, 180 Mass. 367; *Central Union Gas Co.* v. *Browning*, 210 N. Y. 10.)

Consignments Are Bailments.—"Where there is no attempt at evasion, but the contract is one of pure agency, providing for a consignment of goods to be paid for at a fixed price out of the proceeds of the goods when sold, this is a bailment for sale not a sale with reservation of title, and the title remains in the consignor, until the goods are sold to a *bona fide* purchaser for value." (*Barnes Safe etc. Co.* v. *Block Bros. Tobacco Co.*, 38 W. Va. 158.)

From Goods on Memorandum.—"Where goods are delivered on memorandum to be paid for when sold it is a sale and not a bailment." (*MacArthur* v. *Wilder*, 3 Barb. [N. Y.].)

From Mortgage.—"A radical distinction between a bailment and a mortgage is that by a mortgage the general title is transferred to the mortgagee subject to being revested by the performance of the condition, but in case of a bailment the bailor retains the general title in himself and parts with the possession for a special purpose." (*Walker* v. *Staples*, 5 Allen [Mass.] 34; also *White* v. *Phelps*, 14 Minn. 27.)

CLASSIFICATION OF BAILMENTS.—Bailments may be variously classified, but for this purpose may be classified as bailments for: (1) mutual benefit; (2) benefit of bailor, and (3) benefit of bailee.

Mutual Benefit.—Such bailments include pledge, hire for use of a thing, hire for services, and work on a thing delivered. (*Young* v. *Leary*, 135 N. Y. 569; *Spafford* v. *Dodge*, 14 Mass. 66.) A loan from which the lender gains a benefit as well as the borrower is a bailment of this class.

Sole Benefit of Bailor.—A bailment for the sole benefit of the bailor is where personal property is kept for the depositor without reward. There are two kinds of such bailments: **deposits** and **mandates.** (*Lyons First Nat. Bank* v. *Ocean Nat. Bank*, 60 N. Y. 278.) "Another distinction is said to be the fact that in a deposit the principal object is the custody of the thing and the service and labor are merely accessory, but that in a mandate the service and labor are the principal object and the thing merely accessory."

Sole Benefit of Bailee.—"To constitute a bailment of this kind there must be a thing lent, it must be lent gratuitously; it must be lent primarily for the use of the bailee, and the specific article must be returned at the termination of the bailment." (Story on Bailments, pp. 223–228.)

RIGHTS AND LIABILITIES OF PARTIES.—The rights and liabilities of the parties are determined from the contract, express or implied, between them.

DUTIES OF PARTIES IN BAILMENTS.—

For Mutual Benefit.—Reasonable care is required of the bailee in the use of the thing, and in case of hiring it is impliedly warranted by the bailor that the thing hired is fit for the purpose for which it is hired. In the absence of the contract the bailee is held to the exercise of ordinary care in relation to the subject matter and is responsible only for ordinary negligence. (*N. Y. Central R. Co.* v. *Lockwood*, 17 Wall. 357; *Mayer* v. *Brensinger*, 180 Ill. 110; *Ouderkirk* v. *Central Nat. Bank*, 119 N. Y. 263.)

For Sole Benefit of Bailor.—The bailee is bound to exercise only slight care and is responsible only for gross neglect or bad faith. (*Carlisle First Nat. Bank* v. *Graham*, 100 U. S. 699; *Gray* v. *Merriam*, 148 Ill. 179.) The bailee may not use the property for his own purpose nor derive any benefit from it. (*Boston etc. Smelting Co.* v. *Reed*, 23 Colo. 523.)

For Sole Benefit of Bailee.—The bailee is held to exercise great care and extraordinary diligence in relation to the subject matter and is responsible for slight neglect. (*Hagebush* v. *Ragland*, 78 Ill. 40; *Scranton* v. *Baxtor*, 6 N. Y. Sup. 5.) He is not responsible for reasonable wear and tear or for the utter loss of the subject matter without neglect attributable to him, provided it was used in the manner anticipated by the bailor. But an unauthorized use of the thing bailed renders the bailee liable for loss even though it is from some inevitable casualty. (*Ross* v. *Southern Cotton Oil Co.*, 41 Fed. 152.)

The rule of law is that "if the thing borrowed is used in a different manner, or for a different purpose, or for a longer time, than was agreed by the parties, the borrower is guilty of conversion and is answerable for all damage, and even for a loss which due care could not have prevented." (*Raynor* v. *Sheffler*, 79 N. J. L. 340.)

The bailor is not responsible to the bailee for any unknown defect in the article or for injury caused thereby. It is implied in a bailment for the benefit of the bailee that he takes care of the thing and keeps it in good order. (*Booth* v. *Terrel*, 16 Ga. 20.)

TITLE OF PROPERTY.—The title remains in the bailor and is not affected by unauthorized acts of the bailee. (*Austin* v. *Dye*, 46 N. Y. 500; *Benner* v. *Puffer*, 114 Mass. 376.) The bailor may assert his title not alone against the bailee but also against creditors of or those claiming through the bailee. "Where property is taken by due process of law, the bailee may deny the title of the bailor." (*The M. M. Chase*, 37 Fed. 708; *French* v. *Star Union Transfer Co.*, 134 Mass. 288.)

Sale or Transfer.—A bailee cannot, in the absence of statute, sell or transfer the property so as to give title even to one acting without the knowledge of the bailee's status.

INSURANCE.—Either party may insure the subject matter. Where a bailee has undertaken to insure the property by either express or implied contract or by usage of trade, he is presumptively required to insure it for its full value. (*Broussand* v. *South Texas Rice Co.*, 103 Tex. 535.)

COMPENSATION.—The bailee of a contract of bailment for mutual benefit is entitled to compensation. "If service is to be rendered the subject matter of the bailment, there must be compensation for the service unless the bailment be a mandate." (*Union Stockyards Co.* v. *Western Land etc. Co.*, 59 Fed. 49.)

BAILEE'S LIEN.—"This right is a right to retain the property in his possession until the charges for the work and expenses upon the identical property are paid. It is a right to retain only, not an interest in the property, and therefore depends upon the actual possession. This possession is said to be the essence of the right. If this be once voluntarily given up, the lien is lost." (*Moulton* v. *Greene*, 10 R. I. 330.)

General Balance.—A bailee is not entitled to a lien on property in his possession for a general balance of account. (*Honig* v. *Knipe*, 25 Mo. App. 574.)

SHOPKEEPER'S LIABILITY FOR CUSTOMERS' CLOTHES.—A shopkeeper is liable as an ordinary bailee for hire for any loss resulting from ordinary negligence. "Whatever garment or article the customer is obliged to lay aside for the purposes of the trading is, in contemplation of law, given into the hands of the shopkeeper and so remains until the transaction is completed." (*McAllister* v. *Simon*, 27 Misc. [N. Y.] 214.)

REDELIVERY.—"The obligation to redeliver or deliver over the property at the termination of the bailment on demand is an essential part of every bailment contract. If the bailee fails to do so, he is liable, unless he can show that his inability arises without fault on his part." (*Hanes* v. *Shapiro*, 168 N. C. 24.) A refusal to redeliver where no lien exists will amount to conversion. (*Alton* v. *Taxicab Co.*, 66 Misc. [N. Y.] 191.)

Excuses for Non-Delivery.—A bailee is excused from making delivery where:

1. The subject matter is lost or destroyed without his fault. (*Young* v. *Leary*, 135 N. Y. 569.)

2. Property is tendered to bailor in accordance with the terms of the contract.

3. Property was delivered to third parties at the direction of the bailor.

4. Goods are taken from the bailee by due process of law, in which case he must notify the bailor. (*Bliven* v. *Hudson River R. Co.*, 36 N. Y. 403.)

TERMINATION OF BAILMENT.—Bailments may be terminated by agreement, lapse of time, fulfilment of the object, act of bailee inconsistent with his duties (*Atlantic Bldg. Supply Co.* v. *Vulcanite Cement Co.*, 203 N. Y. 133; *Ross* v. *Southern Cotton Oil Co.*, 41 Fed. 152), or by destruction of subject matter.

Law of Insurance

DEFINITION.—"A contract of insurance is an agreement by which one party for a consideration, which is usually paid in money and called the premium, promises to make certain payments of money upon the destruction or injury of something in which the other party has an interest." (*U. S. Credit System Co.* v. *Claflin*, 165 Mass. 501.) "The contract of insurance, as all know, is a contract of indemnity, upon the terms and conditions specified in the policy of insurance. It is a peculiar contract and one of hazard purely. The insurer undertakes, for a comparatively small premium, to guarantee the insured against loss or damage, upon the exact terms and conditions agreed on, and upon no other." (*Glendale Woolen Co.* v. *Protection Ins. Co.*, 21 Conn. 19.)

NECESSARY ELEMENTS.—That a contract of insurance may be complete, the following five elements must be present:

1. Subject matter insured
2. A risk to be insured against
3. The amount of indemnity
4. The duration of the risk
5. The premium of insurance (*Tyler* v. *New Amsterdam F. Ins. Co.*, 4 Rob. [N. Y.] 151.)

CONTRACT OF INDEMNITY.—Indemnity is an essential element and the primary purpose of insurance. A contract that does not possess this element is not one of insurance. (*Vredenburgh* v. *Physicians' Defense Co.*, 126 Ill. App. 509.)

INSURABLE INTEREST.—Unless a person has an interest in the property, he cannot insure it, so as to recover in the event of a loss. (*Sweeney* v. *Franklin Fire Ins. Co.*, 20 Pa. 337.)

What Constitutes Insurable Interest.—"It would seem, therefore, that whenever there is a real interest to protect and a person is so situated with respect to the subject of insurance that its destruction would or might reasonably be expected to impair the value of that interest, an insurance on such interest would not be a wager within the statute, whether the interest was an ownership in, or a right to the possession of the property, or simply an advantage of a pecuniary character having a legal basis, but dependent upon the continued existence of the subject. It is well settled that a mere hope or expectation, which may be frustrated by the happening of some event, is not an insurable interest." (*Riggs* v. *Commercial Mutual Ins. Co.*,

125 N. Y. 7.) An insurable interest may be legal or equitable, vested or contingent.

"**The test of insurable interest** is whether an injury to the property or its destruction by the peril insured against would involve the assured in pecuniary loss." (*Berry* v. *American Cent. Ins. Co.*, 132 N. Y. 49.)

Time of Insurable Interest.—In fire and marine insurance the insurable interest must exist in the insured at the time the risk is placed as well as at the time of the loss. In life insurance it must exist at the time the contract is made but may cease at any time thereafter.

THE CONTRACT.—

Form of Contract.—A contract of insurance need not be in writing, in the absence of legislative requirement. (*International Ferry Co.* v. *American Fidelity Co.*, 207 N. Y. 350.) In many states a form of fire insurance contract is prescribed by statute approaching more or less the form outlined in the Insurance Laws of New York.

Nature of Contract.—A contract of insurance on property is personal with the insured and does not pass with the property upon transfer to new owners. (*Lett* v. *Guard Fire Ins. Co.*, 125 N. Y. 82.)

Assignability of Contract.—Fire insurance contracts cannot be assigned without consent of insurer. Marine policies, however, are assignable at any time without consent of insurer. Life insurance policies payable to the estate of the insured may be assigned by him at any time, though very often such assignment is ineffectual until the insurance company is notified. In life insurance policies where a third party is designated as the beneficiary, he will have a vested right in the policy and it cannot be assigned without his consent.

What Law Governs.—The U. S. Supreme Court says: "Contracts are to be governed as to their nature, their validity and their interpretation, by the law of the place where they were made unless the contracting parties clearly appear to have had some other law in view." (*Liverpool etc. S. Co.* v. *Phoenix Ins. Co.*, 129 U. S. 397.)

RELATION OF INSURER AND INSURED.—The relation existing between insurer and insured is one of **debtor and creditor.** The policyholder is a creditor and cannot compel the company to disclose to him internal company affairs.

CONCEALMENT.—A contract of insurance is one requiring good faith between insurer and insured. Fraudulent dealings are fatal to the rights of the party responsible for it. In marine insurance concealment of a material fact whether innocent or fraudulent avoids the contract. (*Howe Machine Co.* v. *Farrington*, 82 N. Y. 126.) In life and fire insurance concealment must be intentional to avoid the contract when not made the subject of special inquiry by the insurers. (*Washington Mills Mfg. Co.* v. *Weymouth Ins. Co.*, 135 Mass. 503.)

REPRESENTATION.—A representation is a statement of facts made at the time of, or before, entering on the contract regarding the subject matter to be insured, upon which basis the contract of insurance is made. A material misrepresentation avoids the contract. Substantial compliance with the representations must be made. (*Smith* v. *Aetna Ins. Co.*, 49 N. Y. 211.)

Opinion.—A mere expression of opinion, although erroneous, or a hope or exaggerated expectation, unless made in bad faith, does not affect the contract and cannot be construed as a misrepresentation of facts. (*Nat. Bank* v. *Ins. Co.*. 95 U. S. 673.)

WARRANTY.—A warranty is a statement of fact or promise regarding the subject matter of insurance which becomes part of the contract either by insertion in the policy itself or by being made a part of it by reference. Warranties must be true, and strictly complied with; otherwise a policy will be avoided. (*Cushman* v. *U. S. Life Ins. Co.*, N. Y. 404.)

Distinctions—Representation and Warranty.—"The crucial distinction between a representation and a warranty is that the one is not, and the other is, a part of the contract between the parties." (*Miller* v. *Commercial Union Assur. Co.*, 69 Wash. 529.) "A representation is collateral to the contract and to be effective must be material to the risk; but a warranty, whether material or not, being part of the contract, has the force of a condition precedent, and unless it is true the insurer is not bound by his promise." (*Donley* v. *Glen Falls Ins. Co.*, 184 N. Y. 107.)

Breach of Warranty.—A breach of warranty, misrepresentations, or intentional concealment of a material fact, even though not the cause of loss, voids the policy because the risk of insurance becomes a different one from the one the insurer undertook to carry. (*Bank of Balston Spa* v. *Ins. Co.*, 50 N. Y. 45; *Clements* v. *Connecticut Indemnity Co.*, 29 App. Div. [N. Y.] 131.)

WAIVER AND ESTOPPEL.—An act by the insurer recognizing the policy as valid after knowledge of a breach will estop the company from taking advantage of the forfeiture. The rule laid down by the U. S. Supreme Court is: "Any agreement, declaration, or course of action on the part of an insurance company which leads a party insured honestly to believe that by conforming thereto a forfeiture of his policy will not be incurred, followed by due conformity on his part, will and ought to estop the company from insisting upon the forfeiture, though it might be claimed under the express letter of the contract." (*Ins. Co.* v. *Eggleston*, 96 U. S. 572.)

MARINE INSURANCE—IMPLIED WARRANTIES.—In marine insurance there are three implied warranties which are as important and of equal weight as if they were written into the policy itself. These are: seaworthiness, deviation, and legality of the adventure.

That **a ship is seaworthy** means "that she shall be in a fit state as to repairs, equipment, and crew, and in all other respects, to encounter the ordinary perils of the voyage insured at the time of sailing upon it." (*Dixon* v. *Sadler*, 5 M. & W. [England] 405; also *Thebaud* v. *Great West. Ins. Co.* 155 N. Y. 516.)

Deviation.—That there shall be no voluntary departure from the course followed in ordinary mercantile usage and no unreasonable delay in prosecuting the voyage. (*Burgess* v. *Equitable Marine Ins. Co.* 126 Mass. 70.)

Legality.—The voyage must be for a legal purpose and conducted in a legal manner. (*Redmond* v. *Smith*, 7 M. & G. [England] 457.)

GENERAL AVERAGE.—"General average is a contribution by the several interests engaged in a maritime venture to make good the loss of one of them for voluntary sacrifice of a part of the ship or cargo to save the residue of the property and the lives of those on board from an impending peril or for extraordinary expenses necessarily incurred for the common benefit and safety of all." (*California Canneries Co.* v. *Canton Ins. Co.*, 25 Cal. App. 303.)

PARTICULAR AVERAGE.—Particular average is a loss occurring to the ship or cargo which is not to be shared by contribution among all those interested but must be borne by the owner of the ship or part of cargo to which the loss or injury occurs. (*Bargett* v. *Insurance Co.*, 5 Bosw. [N. Y.] 395.)

COINSURANCE.—In marine insurance in the event of a loss the insured can only recover the proportion of the loss that the face of the policy bears to the entire value of the property. This limits the recovery unless the property is fully insured or there is a total loss, and in effect makes the insured a coinsurer.

In fire insurance the insured recovers the amount of the loss up to the face of the policy, except in those cases where the policy is issued with a coinsurance clause. The usual custom is to issue policies at a reduced premium with an 80% coinsurance clause. This means that the insured must carry insurance on his property up to 80% of its value and if he fails to carry that amount he will become a coinsurer and bear a proportion of the loss in case of fire.

Formula for determining the amount of loss to be paid by the insurance company on policies issued with an 80% coinsurance clause:

Let x = amount to be recovered.
V = value of property.
P = amount of policy.
L = the loss.

Formula

$$x = \frac{P\,L}{.80\,V}$$

PROOF OF LOSS.—Fire insurance policies generally require that the insured shall give the company immediate notice in case of fire and furnish proof of loss within 60 days after fire. The insured must use reasonable diligence to fulfil these requirements to protect his rights under the policy.

SUBROGATION.—"In fire insurance, as in marine insurance, the insurer, upon paying the assured the amount of the loss of the property insured, is doubtless subrogated in a corresponding amount to the assured's right of action against any other person responsible for the loss. But the rights of the insurer against such other person does not rest upon any relation of contract or of privity between them. It arises out of the nature of the contract of insurance as a contract of indemnity, and is derived from the assured alone; and can be enforced in his right only. By the strict rules of the common law, it must be asserted in the name of the assured. In a court of equity of or admiralty, or under some state codes, it may be asserted by the insurer in his own name, but in any form of remedy the insurer can take nothing by subrogation, but the rights of the assured, and if the assured has no right of action, none passes to the insurer." (*St. Louis, I. M. & S. Ry. Co.* v. *Commercial Union Ins. Co.*, 139 U. S. 235.)

Law of Sales

DEFINITIONS, ETC.—A sale is "an exchange of goods or property for money paid or to be paid." (*Hatfield* v. *State*, 9 Ind. App. 296.) "A transfer, in pursuance of a valid agreement, from one party, called the seller, to another, called the buyer, of the general or absolute title to a specific chattel, for a price, or a consideration estimated in money." (Mechem Sales, § 1.)

Elements of a Sale.—The essence of a sale is transfer of property from the seller to the buyer for a price in money.

Requisites.—These are existence of the subject matter, either actual or potential, an agreed price in money, parties (buyer and seller) capable of contracting, and mutual assent.

Contract to Sell.—A contract to sell, often called an executory sale, is a contract whereby the seller agrees to transfer the title to personal property to the buyer at an agreed price. The elements required for a sale are necessary in a contract to sell except that the goods need not be in existence, ascertained, or in possession of the seller at the time the contract is made.

A **sale** is a completed transaction, title to the subject matter vesting in the buyer on delivery, actual or constructive. A **contract to sell** is an agreement to consummate a sale on the completion of further acts by the parties. Title remains in the seller until the happening of some event or something further is done by the parties.

FORM OF CONTRACT.—Contracts of sale may be oral or written except in cases where the statutes require enforcible contracts to be in writing and signed by the parties to be charged. See "Statute of Frauds" mentioned herein.

CONTRACT LAW GOVERNS.—Contracts of sale are governed by general rules and laws of contracts as to competency of parties, consideration, subject matter, and mutuality.

Law of the Place of Sale Governs.—A sale is made at the place where it is executed by transfer of property to buyer. Where an order is placed by mail or telegraph and accepted at a distant place and goods are delivered to a common carrier for shipment to buyer, sale is governed by law of the place of shipment. (*Betz* v. *McMorrow*, 173 Mass. 8.) Where, however, it is the intention of the parties that title shall not pass until delivery by carrier to buyer, the law of the place of destination governs. (*Theo. Hamm Brewing Co.* v. *Young*, 76 Minn. 246.)

SUBJECT MATTER.—In a sale the subject matter must be in existence, either actual or potential. Potential existence is something which will come into actual existence by efflux of time, such as wool from sheep in possession of the seller or crops sown on seller's land.

Existence of Thing Sold.—Mutual mistake as to existence of the goods to be sold in a contract to sell renders the contract void.

Emblements or Fructus Industriales.—Cultivated products of the soil while growing and attached to the soil are considered part of the land and their sale can be consummated only in conformity with the law. On severance from the soil they are treated as personalty and may be the subject of an oral sale.

Annual crops.—The sale of annual crops is treated as a sale of goods and is not an interest in lands. (*Whitmarsh* v. *Walker*, 1 Met. [Mass.] 313.)

Natural Products of the Soil.—The natural products of the soil, such as trees and their fruit before severance, are treated as part of the real property.

Emblements, Crops, and Products of Soil Under the Uniform Sales Act.—The term **goods** includes "emblements, industrial growing crops, and things attached to or forming part of the land which are agreed to be severed before sale or under the contract of sale." (Uniform Sales Act, Sec. 76.)

SALE OF NECESSITIES.—Parties not competent to contract cannot be held on their purchase of necessities at the contract price. But under the Uniform Sales Act they may be held liable for their actual requirements at time of delivery at a reasonable price, not necessarily the sale price. (Uniform Sales Act, Sec. 2.)

PRICE.— The price is what is agreed to between the parties. But where goods are sold and delivered without a price being agreed on, there is an

implied agreement to pay a reasonable or market price for such goods. (*Rezus* v. *Moran*, 9 N. Y. S. 927.)

PLACE.—Where no place of delivery is specified under an executory contract of sale, the seller's place of business is construed as such. (*Gross* v. *Ajello*, 116 N. Y. S. 380.)

STATUTE OF FRAUDS.—At common law, sales of chattels could be made orally, but most of the states have passed statutes requiring certain sales to comply with specified requirements. The Statute of Frauds, adopted in nearly every state where Anglo-Saxon jurisprudence is the foundation of the laws, requires in substance that a sale of goods, wares, or merchandise for a price ranging from $30 to $2,500 in various states shall be unenforcible, unless:

1. The buyer accepts part of the goods so sold;
2. Gives something in part payment; or
3. Some note or memorandum is signed by the party to be charged.

Under the Uniform Sales Act the amount is $500 and upward.

Written Memorandum.—The written memorandum required under the statute may be formal, as a bill of sale, or informal, made up of several notes or letters. The essentials required are a recital of the agreement, subject matter, terms, and names of the parties. Most important is that the **memorandum shall be signed** by the person to be charged or held thereon.

Where Statute Does Not Apply.—Contract for work, labor, and services.—"It is now the settled rule that when goods contracted for exist *in solido* and are capable of delivery at the time, it is within the statute; but where they are to be made, or something is to be done to put them in a condition to be delivered, according to the terms of the contract, it is not within the statute." (*Gadston* v. *Lance*, *McMullan*, S. C. Eq. 87.)

Special Order.—A contract for goods to be manufactured for the purchaser on special order and not for the general market is a contract for work, labor and services, and not a sale. (*Goddard* v. *Binney*, 115 Mass. 450.)

PASSING OF TITLE.—In a sale title passes on delivery, which may be actual or constructive—for instance, transferring warehouse receipts or merely separating the goods. The intention of the parties governs. (*Ober* v. *Carson*, 62 Mo. 214.) If the subject matter is in a deliverable state, the title passes on payment of the price even though the article is to be delivered subsequently. Where the goods are not in a deliverable state and require something further to be done, as weighing, measuring, or separation from a larger mass, title does not pass until this is done.

What Constitutes Delivery.—Where goods are segregated from a larger mass, set aside and in shape to be delivered, title passes to the buyer. But if something further is to be done so as to make it ready for delivery, title does not pass to the buyer until that is done. To constitute delivery the goods must be placed under the control of the buyer. (*Gross* v. *Ajello*, 116 N. Y. S. 380.)

Place of Delivery.—The place of delivery is where the goods are at time of sale. This, however, is governed by the intention of the parties and usage of trade.

Delivery to a Common Carrier.—If there is a trade custom that the seller must ship the goods, delivery is complete and title passes to the buyer by delivery to the common carrier. Any loss thereafter falls on the buyer. (*Dannermiller* v. *Kirkpatrick*, 201 Pa. St. 218.)

F. o. b.—In sales made, **f. o. b.** at a given point means, "Free on board" railroad or ship at that place. The seller is under obligation to deliver the goods at his expense and title does not pass until the goods are so delivered. The carrier is the agent of the buyer.

Goods Ordered at Distant Places.—Where goods are ordered from a seller at a distant place the intention of the parties controls. Generally title passes on delivery of the goods to the common carrier. But if the seller takes the bill of lading in his own name, title is retained until the bill of lading is indorsed to the buyer.

C. o. d. Sales.—In sales, cash on delivery, most courts hold that title passes to the buyer when the subject matter is delivered to the common carrier but that the buyer is not entitled to possession until the price is paid.

Sales Subject to Approval.—In sales subject to approval title does not pass until the conditions precedent, which are examination and approval, are completed.

Goods to be Manufactured.—In a contract of sale of goods to be manufactured, title does not pass until after the goods are in a deliverable state.

Sale by Sample or Description.—Where goods are sold by description or sample, title passes when they are applied to the contract and put in a deliverable condition.

Stolen Goods.—A thief cannot convey title to goods and a person buying goods from one having larcenous possession not alone gets no title but is also liable for their conversion if he has disposed of them. (*Reichard* v. *Hutton*, 142 N. Y. S. 935.)

Goods Obtained by Fraud.—Where a seller has voluntarily parted with the title to goods to the buyer as a result of fraud on the part of the buyer, an innocent second purchaser obtains a good title and will be protected. (*Phelps* v. *McQuade*, 158 App. Div. 528.)

EXPRESS WARRANTY.—An express warranty is a statement of fact made by the seller as to the quality, quantity, durability, or other characteristic of the thing sold. To hold the seller on his warranty the buyer must have relied on the statements in making his purchase. (*Heath Dry Gas Co.* v. *Hurd*, 124 App. Div. 68; *Naylor* v. *McSwegan*, 21 N. Y. S. 930.)

Opinion and "Dealers Talk."—An expression of opinion, hope, or expectation is not a statement of fact and does not amount to a warranty. Likewise, commendatory statements as to the character of the articles and mere statements of opinion, although unfounded, are not sufficient to constitute warranties. (*Arnold* v. *Norfolk etc. Hosiery Co.*, 148 N. Y. 392.)

IMPLIED WARRANTIES.—

Title.—The seller impliedly warrants the title to the goods sold. Where a vendor has goods for sale and in his possession it is *prima facie* evidence that he has title to the goods. A seller of goods impliedly warrants:

1. That he has good title;
2. The buyer will not be disturbed by adverse claims of title; and
3. The goods are free from claims, charges, and incumbrances at the time of sale. (*Smith* v. *Ruggles*, 3 N. Y. S. 329.)

Where, however, goods are in the hands of third parties, there is no implied warranty that the title to the goods is in the seller.

Quality—Fit For Use.—If the purchaser makes known the purpose he intends to use the goods for and the seller offers articles for sale for that purpose, he impliedly warrants that they are fit for that purpose. (*McKlige* v. *Carroll*, 105 N. Y. S. 342.)

Quality—Manufacturer.—A manufacturer impliedly warrants the goods made by him to be free from latent defects of manufacture. (*Carleton* v. *Lombard Ayres & Co.*, 149 N. Y. S. 137.) Where, however, the seller is a dealer and not a manufacturer and the buyer knows it, there is no implied warranty against a latent defect of manufacture. (*Whitman* v. *Jacobson*, 119 N. Y. S. 246.)

Quality—Foodstuff.—In most jurisdictions the courts hold that a seller impliedly warrants foodstuffs sold to the consumer to be fit and wholesome for human consumption. In a few states this implied warranty extends to the wholesaler. (*Leahy* v. *Essex Co.*, 164 App. Div. 903; *Race* v. *Krum*, 147 N. Y. S. 818.)

Quality—Samples.—Goods sold by sample or description are impliedly warranted to correspond with the sample or description as to character and quality and that the goods are merchantable. (*E. T. Burrowes Co.* v. *Rapid Safety Filter Co.*, 97 N. Y. S. 1048; *Bloom* v. *Reisina*, 135 N. Y. S. 547; *Plumb* v. *J. W. Hallower & Sons Co.*, 130 N. Y. S. 147.)

DOCTRINE OF CAVEAT EMPTOR.—In sales the doctrine of *caveat emptor* applies in every state except Louisiana. Under this doctrine, which means, "let the buyer beware," it is not incumbent on the seller to disclose facts which a buyer can ascertain by examining the articles. In order to charge a seller with fraud there must be a false representation or an active suppression of facts so as to convey a false impression. (*Wolf* v. *Michael*, 46 N. Y. S. 991.)

ESTOPPEL AND WAIVER OF DEFECTS.—A buyer who has knowledge of a fraud or defect of an article purchased and retains the articles without objection, cannot at a later date set up fraud to have the sale set aside. (*Wellauer* v. *Fellows*, 48 Wis. 105.)

BUYER'S STATEMENTS OF FINANCIAL STANDING.—A merchant who gives false statements to a commercial credit-reporting agency is liable for an action for rescission and for damages to one who extended credit on the basis of the statements received by and given out by such agency, even though the representations were not made to the creditor personally and there was no specific intent on the part of the merchant to defraud his creditors by the false statements made by him. (*Mills* v. *Brill*, 105 N. Y. App. Div. 389; *Goldsmith* v. *Stern*, 84 N. Y. 869.) Mere undisclosed insolvency of a buyer does not impute fraud; intent not to pay for goods when buying is essential. (*Hirsch Lumber Co.* v. *Hubbell*, 128 N. Y. S. 85.)

REMEDIES OF BUYERS FOR BREACH OF EXPRESS WARRANTY.—In most jurisdictions the courts hold that where title has passed the sale cannot be rescinded for breach of express warranty. The buyer's remedy lies in an action for damages.

When title has not passed the goods may be rejected and the sale rescinded on discovery of the breach of warranty.

REMEDIES OF BUYERS FOR BREACH OF IMPLIED WARRANTY.—In case of breach of implied warranty the buyer has a choice of remedies. First, he may accept the goods and sue for damages for the breach. Second, rescind the sale and recover the purchase price. On the latter case he must act promptly. (*Henry Kupfer & Co.* v. *Pellman*, 121 N. Y. S. 1081.)

REMEDIES OF SELLER—RESCISSION.—Insolvency of a buyer at the time of sale is ground for rescission by the seller. (*In re* Lewis, 125 Fed. 143.)

UNPAID VENDOR.—

Lien.—When title has passed to the purchaser but the goods are in possession of the seller, he has a lien on the goods sold for the unpaid purchase price if the sale was for cash. If the sale was on credit and the terms of credit have expired or the buyer has become insolvent, the seller has the same remedy. (*Cragin* v. *O'Connell*, 169 N. Y. 573.)

Stoppage in Transitu.—This is a right of a seller of goods on credit to retake them from a common carrier on discovery of insolvency of the buyer and before the goods have come into possession of the vendee or third parties have obtained *bona fide* rights in them. The right continues as long as the goods are in possession of the common carrier. (*Jones* v. *Earl*, 37 Cal. 630; *Gass* v. *Southern Pacific Co.*, 152 App. Div. 412.)

Vendor's Rights.—A vendor who has exercised his rights to stoppage *in transitu* or has a lien, may resell the goods as agent for the vendee and sue for the difference or rescind the sale and recover title to the goods. Notice to the buyer of intention of the seller of the resale is required in some jurisdictions.

UNIFORM SALES ACT.—The Uniform Sales Act, as drafted by the commissioners appointed to work out uniform laws governing commercial transactions, combines the best features of the existing laws of the various states. The Uniform Sales Act has been adopted in the following states and territories:

Alaska	1913	New York	1911
Arizona	1913	North Dakota	1917
Connecticut	1907	Ohio	1915
Illinois	1915	Pennsylvania	1915
Maryland	1910	Rhode Island	1908
Massachusetts	1908	Tennessee	1919
Michigan	1913	Utah	1917
Minnesota	1917	Wisconsin	1911
Nevada	1915	Wyoming	1917
New Jersey	1907		

Law of Guaranty and Suretyship

GUARANTY.—

Definition.—A contract of guaranty is "an undertaking by one person that another shall perform his contract or fulfil his obligation, or that if he does not, the guarantor will do it for him." (*Gridley* v. *Capen*, 72 Ill. 11.)

Elements of Guaranty.—A contract of guaranty, although a separate and distinct contract from that of the original debtor, is a collateral undertaking to that other contract to which it relates. It is a secondary and not a primary obligation and can only be called upon to fulfil its terms upon the failure of the primary obligation.

Test—Guaranty and Suretyship.—"Where the question involved is whether the promise is original or collateral, the test is whether the credit is given to the person sought to be charged or someone else." (*Jones etc. Steel Co.* v. *Graham*, 194 Ill. App. 571.)

Requisites.—All the elements necessary to support a simple contract are required to establish a contract of guaranty. (*Davis Sewing Mach. Co.* v. *Richards*, 115 U. S. 524, a leading case on the subject.)

SURETYSHIP.—

Definition.—A contract of suretyship is "a contract by one person to be answerable for the payment of some debt, or the performance of some act or duty, in case of the failure of another person who is himself primarily responsible for the payment of such debt or the performance of the act or duty." (*Roberts* v. *Hawkins*, 70 Mich. 566.) It is "a **direct** contract to pay for the debt of another." "A contract whereby one person engages to be answerable for the debt, default or miscarriage of another." (*State* v. *Parker*, 72 Ala. 181.)

Elements of Suretyship.—Elements required to support a contract are necessary for a contract of suretyship. In addition there must be a real principal who is liable, and if there is no principal, the promisor is a principal and not a surety. The principal's obligation must be valid in order to bind the surety. If the principal is not bound on the obligation by reason of a defect, such as fraud or duress or other illegality practiced on him, the surety is not bound.

Validity of Surety's Obligation.—A surety is only liable on a valid enforcible contract against his principal. Utmost good faith is required in negotiations leading to the establishing of a contract of suretyship. False or fraudulent statements made or concealments of material facts will relieve the surety from his obligation, although the contract may be binding on the principal. To enable a surety to avoid his obligation for such reasons, it is necessary to connect the creditor with the false statements. (*Gardner* v. *McGowan*, 27 Tex. 487.)

DISTINCTIONS BETWEEN GUARANTY AND SURETYSHIP.—"The **surety** is liable as much as his principal as soon as default is made, without any demand upon the principal or notice of his default. The **guarantor's liability** is less stringent. Unless demand is made within a reasonable time, and notice given in case of default, he is discharged to the extent he may be damaged by delay." (*Hall* v. *Farmers Bank*, 23 Ky. L. 1450.) "A **surety** undertakes to pay if the principal **does not**, while a **guarantor** undertakes to pay if the principal cannot." (*McIntosh-Huntington Co.* v. *Reed*, 89 Fed. 464.) "A **guarantor** is one who undertakes by a separate and independent agreement that another person shall perform a duty which he owes to a third person. A **surety** is one who joins with another person in agreeing that such other person shall perform the duty he undertakes." (*Ricketson* v. *Lizotte*, 98 Vt. 386.)

"A **guaranty** is, perhaps, always understood, in its strict legal and commercial sense, as a collateral warranty, and often as a conditional one, against some default or event in future. The term **warranty,** on the other hand, is generally understood as an absolute undertaking in present, as well as in future, against the defect, or for the quantity or quality contemplated by the parties in the subject matter of the contract." (*Sturges* v. *Circleville Bank*, 11 Oh. St. 153.)

"The term **'warranty'** is an engagement or understanding forming a part of the transaction. It is an absolute understanding or liability on the part of the warrantor, and the contract is void unless it is strictly and literally performed. A **guaranty,** on the other hand, is a collateral promise to answer for the debt, default or miscarriage of another." (*Masons Union L. Ins. Assoc.* v. *Brockman*, 20 Ind. A. 206.)

FORM OF CONTRACT.—Under the Statute of Frauds, contracts of suretyship and guaranty must be in writing to be enforcible.

NOTICE OF DEFAULT.—The general rule is that a contract of guaranty being collateral, it is necessary for the creditor to notify the guarantor of any default by the debtor. A surety, however, need not be notified, as his obligation is absolute.

LIABILITIES OF GUARANTORS AND SURETIES.—The liabilities of sureties and guarantors are *strictissimi juris* and should not be extended by construction. The liability is confined to the precise terms of the contract. (*First National Bank of Pontiac* v. *Valentine*, 139 N. Y. 1037; *Hamilton Trust Co.* v. *Shevlin*, 141 N. Y. S. 232.) Ordinarily a guaranty refers to future debts and will be so construed in the absence of a clear intention to include accrued debts. (*Manhattan Rolling Mills* v. *Dellon*, 113 N. Y. S. 571.)

RIGHTS OF GUARANTORS AND SURETIES.—A surety or guarantor who has discharged an obligation on default of the debtor is subrogated to the position of the creditor and has a right of indemnity against the debtor. This right is limited to indemnity only and if the guarantor settles with the creditors for less than the face value of their claims, he can only recover from the debtor the amount of settlement and costs and expenses. If there are cosureties or coguarantors, he has a right to contribution of a proportionate share from each one.

DISCHARGE OF SURETIES AND GUARANTORS.—The following are some of the acts which will discharge a surety or guarantor from his liability.

1. Payment of the debt or extinguishment of the obligation by the debtor.
2. By an alteration or change in the contract without the consent of the surety or guarantor. (*Weiss* v. *Leichter*, 113 N. Y. S. 999.)
3. By extension of time by the creditor beyond the original contract without the consent of the sureties.
4. By substitution of principals or cosureties.
5. A release of one of several persons jointly bound as principals.
6. Release of the debtor by the creditor without the consent of the surety.
7. Release of one of the cosureties by the creditor releases the other sureties.
8. By an act of the creditor whereby the surety is deprived of rights against the debtor.
9. By compromise and settlement between the debtor and creditor.
10. By allowing the statute of limitations to run against the principal.
11. A guarantor is discharged if the creditor unreasonably delays bringing action against the debtor.
12. A guarantor of a note is released by a renewal of the note at maturity. (*Barnett* v. *Wing*, 16 N. Y. S. 567.)

CONTENTS

SECTION 2

MATHEMATICS

Logarithms

DEFINITION.—"The logarithm of a number to a given base is the exponent which indicates the power to which the base must be raised to produce the given number."[1]

"A set of logarithms x, of all numbers y, corresponding to a given base a, is a **system of logarithms.** Two systems are in use, the common, or Briggsian, system, which is used in practical computations, and the hyperbolic, or Naperian, system, which is always used in analytical work. The base of the common system is 10, while the base of the Naperian system is the number $e = 2.71827$."[2]

USE OF LOGARITHMS.—Logarithms are usually employed to reduce the work involved in the multiplication and division of numbers, and in computing powers and extracting roots. Interest computations extending over long periods are facilitated by use of logarithms. Thus the amount of $1 at compound interest for 30 periods at 6% is found by raising 1.06 to the 30th power. To perform this operation by ordinary multiplication requires a prolonged computation. This and similar processes can be much simplified by use of logarithms.

PRINCIPLE OF LOGARITHMS.—It is possible to raise any number to any desired power by multiplying the number by itself the required number of times. Thus, 2^3 means $2 \times 2 \times 2$, or 8; 3^4 means $3 \times 3 \times 3 \times 3$, or 81; 4^4 means $4 \times 4 \times 4 \times 4$, or 256; and so on. Or again,

3	to	1st	power	is	3
3	"	2nd	"	"	9
3	"	3rd	"	"	27
3	"	4th	"	"	81
3	"	5th	"	"	243
3	"	6th	"	"	729
3	"	7th	"	"	2,187
3	"	8th	"	"	6,561
3	"	9th	"	"	19,683
3	"	10th	"	"	59,049

and so on. The numbers in the second column are the indices, indicating the power to which 3 is raised to secure the number in the third column.

Illustration.—Suppose 243 is to be multiplied by 81. By ordinary multiplication, $243 \times 81 = 19{,}683$. From the foregoing table it is seen that $243 = 3^5$, and $81 = 3^4$. By a principle of mathematics known as the **law of indices,** $3^5 \times 3^4 = 3^{5+4} = 3^9$ That is, 3^5 is multiplied by 3^4 by adding the indices. The table shows that $3^9 = 19{,}683$, as has also been found by multiplication.

[1] E. B. Skinner, Mathematical Theory of Investment, p. 30.
[2] *Ibid.*

Conversely, $243 \div 81 = 3^5 \div 3^4 = 3^{5-4} = 3$; for 3 raised to the 5th power is 243, which divided by 3^4, or 81, = 3. Thus addition and subtraction are substituted in performing multiplication and division.

Suppose it is desired to extract the square root of 59,049. In the table above it is seen that this is 3 raised to the 10th power, or 3^{10}. The square root of 59,049 is, therefore, the same as the square root of 3^{10}. According to the law of indices, dividing the index of a number by 2 is equivalent to extracting the square root. Therefore, $3^{10/2}$, or 3^5, is the square root of 3^{10}. According to the table $3^5 = 243$. That this is the square root of 59,049 is seen by multiplying 243 by 243. By reversing the procedure a number may be raised to any power by simply multiplying its index by that power. Thus 243, or 3^5, may be squared by multiplying 5, the index of 3, by 2; thus $243^2 = 3^{5\times2} = 3^{10} = 59{,}049$. Likewise, $27^3 = 3^{3\times3} = 3^9 = 19{,}683$.

THE LOGARITHM.—In the above table, the numbers in the second column are the logarithms of the numbers in the third column to the base 3 in the first column. In other words, the logarithm of a number is the power to which its base must be raised to produce that number. Thus, 8 is the logarithm of 6,561 to the base 3, and 2 is the logarithm of 9 to the base 3.

In the above table, 3 has been selected as the base. Any number may be so employed, but 10 is the base usually taken. It forms the basis of the common system of logarithms. Common logarithms of numbers are, therefore, indices showing the power to which 10 must be raised to equal those numbers, just as in the table above the logarithms are indices of 3.

As most numbers are not integral powers of 10, the logarithms in the common system are integers only in the rare cases when the numbers are even powers of 10. Thus, $10^2 = 100$; therefore, 2 is the logarithm of 100 to the base 10. Similarly, 3 is the logarithm of 1,000 to the base 10, and 4 is the logarithm of 10,000 to the base 10. But the logarithm of 500 must be something more than 2 and less than 3; that is, it is 2 plus a decimal.

A five-place logarithm table gives this decimal part of the logarithm to 5 points, as....................	.69897
A six-place table gives it as......................	.698970
A thirteen-place table gives it as..................	.6989700043360
A twenty-place table gives it as...................	.69897000433601880479

Usually the last digit is not exactly correct, being approximated or rounded off, just as $18.217 is rounded off to $18.22.

THE CHARACTERISTIC.—The integral part of a logarithm is the "characteristic." The logarithm of 500 to the fifth place is 2.69897, and therefore the characteristic of the logarithm of 500 is 2. Similarly, the characteristic of the logarithm of all numbers from 100 to 999, inclusive, is 2; for the logarithm of 100 is 2, the logarithm of 999 is 2.99957, and the logarithms of all numbers between 100 and 999 lie between 2 and 2.99957. The logarithm of 1,000 is 3, for $10^3 = 1{,}000$. The logarithm of 9,999 is 3.99996. Therefore, the characteristic of the logarithms of all numbers from 1,000 to 9,999 is 3.

The characteristic of a logarithm is determined by the position of the decimal point in its number, being independent of the digits of the number. Thus, the characteristic of the logarithm of 7, which has one unit figure, is zero; of the logarithm of 77.77, which has one figure to the left of the unit place, is 1; of the logarithm of 9.3, with one unit figure, is 0; of the logarithm of 3,742.17, with three figures to the left of the unit place, is 3; of the logarithm of 56,689.778, with five figures to the left of the unit place, is 4; and so on. Hence to find the characteristic of the logarithm of a number, the rule is:

Rule.—To find the **characteristic** of the logarithm of a number, find how many places the first significant figure (figure other than 0) is removed from unit place. It is positive or negative (plus or minus) according as the first significant figure is to the left or right of unit place. Thus:

Characteristic of the logarithm of	1.0	is 0
" " " " "	0.1	" $\bar{1}$ (minus 1)
" " " " "	22.0	" 1
" " " " "	.0222	" $\bar{2}$ (minus 2)
" " " " "	275.0	" 2
" " " " "	.0004	" $\bar{4}$ (minus 4)

THE MANTISSA.—The mantissa of the logarithm of a number is the decimal portion. It does not depend upon the location of the decimal point, but upon the significant digits of which the number is composed. Thus, while the characteristics of the logarithms of 999, 99.9, and 9.99, are 2, 1, 0, respectively, the mantissa is the same for all, viz., .99957. Again, the characteristic of the logarithm of 327, 729, and 211, is 2 in each case, but the mantissas are .51455, .86273, and .32428. While the characteristic is positive or negative, depending upon the position of the decimal point, the mantissa is always positive. The mantissa is found by the use of a table of logarithms.

FINDING THE LOGARITHM OF A NUMBER.—The logarithm of a number is determined by first finding the characteristic by the rule given above. The mantissa is found from a table of logarithms, as follows:

Rule 1. When the number is composed of not more than four figures: In the first column of the table of logarithms, find the first two or three or four figures of the number (according to the table used), then follow across on the same line until the column is reached headed by the same figure as the last digit in the number whose logarithm is to be found.[3] The decimal so found is the mantissa. To avoid repetition in the table, the first two (sometimes three or four) figures of the mantissa may be printed at intervals only, in the second column.

Find log 37.53 (the logarithm of 37.53). By the rule, the characteristic is 1. In the first column of the table of logarithms, find 375, and on the same line in the column headed by last digit 3, is found the mantissa, .57438. As the characteristic is 1, the logarithm of 37.53 is 1.57438. Similarly:

log	727.4	is	2.86177
"	3,256.0	"	3.51268
"	7,274.0	"	3.86177

Rule 2. When the number is composed of more than four figures: By glancing at the table of logarithms it will be seen that, within certain limitations, the numbers are proportional to their logarithms, and vice versa. Thus:

log 4,290 .... 3.63246		
		difference is .00010
" 4,291 .... 3.63256		
		" " .00010
" 4,292 .... 3.63266		
		" " .00010
" 4,293 .... 3.63276		

[3] A five-place table is employed in the computations which follow.

While the difference between two successive numbers is constantly 1, the difference between their logarithms is also constant. These differences are the **tabular differences.** Logarithms are, therefore, approximately proportional to their corresponding numbers, and may be assumed to be exactly proportional for practical purposes. Consequently, if any one of the numbers be increased by 0.1, its corresponding logarithm is also increased by 0.1 of the tabular difference between the logarithm of that number and the logarithm of the next higher number. Thus, to take numbers lying between 4,290 and 4,291, the difference between whose logarithms is 10, as shown above:

$$\begin{aligned} \log 4{,}290.1 &= 3.63247 \text{ (or } 3.63246 + .1 \text{ of } 10) \\ \text{“} \quad 4{,}290.2 &= 3.63248 \text{ (or } 3.63246 + .2 \text{ of } 10) \\ \text{“} \quad 4{,}290.9 &= 3.63255 \text{ (or } 3.63246 + .9 \text{ of } 10) \end{aligned}$$

Finding logarithms of numbers lying between two numbers in the table is **interpolation.** To lessen the work of interpolation, in some tables the tabular differences are inserted in a separate column, and at the bottom of the page is sometimes given the proportional part of the last figure. Thus, if the tabular difference is 102, the additions to be made for .1, .2, .3, .4, and so on, are 10, 20, 31, 41, and so on. Had the number whose logarithm was to be found been 42,901 instead of 4,290.1, the mantissa would have been the same, but the characteristic would have been 4 instead of 3.

If the number is composed of six figures, as 429,015, and a six-place table is used, the correction for the last two figures is found by interpolation. The correction for the fifth figure is .1 of 102, or 10, and the correction for the sixth figure is .05 of 102, or 5; hence 15 must be added to 3.632457, the logarithm of 4,290, which gives 5.632472 for the logarithm of 429,015.

FINDING NUMBER CORRESPONDING TO LOGARITHM.—Given the logarithm of a number, the number is found by use of the same table of logarithms. First, from the characteristic of the logarithm the position of the decimal point is determined, the operation being the reverse of that employed in finding the characteristic. If the characteristic is always the same as the number of places the first significant figure is removed from unit place, it follows that in the number corresponding to a given logarithm, the number of places the first significant figure is removed from unit place will depend upon the characteristic, being to the left or right of unit place according as the characteristic is positive or negative.

If the mantissa appears in the table of logarithms, the corresponding number is found immediately. Thus, the number whose logarithm is 2.79106, which is found in the table, is 618.1, position of the decimal being determined as noted above. But if the table shows no mantissa in exact agreement with mantissa of the number sought, the first identical portions of the mantissa are taken; then by the principle of proportional parts, additional figures are added.

Illustration.—Thus, the mantissa of the logarithm of 1.32522 lies between .32510 and .32531 as given in the table. To find corresponding number, proceed as follows:

$$\begin{array}{lrr} \text{Mantissa of log of} & 2{,}115 = & .32531 \\ \text{“ \quad “ \; “ \; “} & 2{,}114 = & .32510 \\ \hline \text{Differences} & 1 & 20 \\ \text{Mantissa of log of required number} & = & .32522 \\ \text{“ \quad “ \; “ \quad “ \quad “} & 2{,}114 = & .32510 \\ \hline & ? & 12 \end{array}$$

By the principle of proportional parts:

$$(?) : 1 :: 12 : 20$$

$$\text{or } (?) = \tfrac{12}{20} = .6$$

Annexing this figure of 6 to 2,114, gives the number whose logarithm is 1.32522 The required number is 21.146, the decimal point being determined by the characteristic, which is 1. Beyond the first two additional figures obtained by interpolation, the accuracy of the process cannot be depended upon, so that the sixth place is the last one to be retained. Instead of using the phrase, "number whose logarithm is 1.32522," the briefer expression, "$\log^{-1}$ 1.32522," is commonly employed. Thus:

$$\log^{-1} 2.75631 = 570.571$$
$$\log^{-1} .00352 = 1.00814$$

FINDING POWERS AND ROOTS OF NUMBERS.—Compound interest problems frequently require the finding of high powers of numbers. Thus the amount of $1 at compound interest in 30 years, interest compounded yearly at 6%, is 1.06^{30}.

$$\text{Log } 1.06 = .02531$$
$$.02531 \times 30 = .7593$$
$$\log^{-1} .7593 = 5.744$$

The answer is $5.74.

Any desired root of a number may be found by dividing the logarithm of that number by the number indicating the root to be found, and then finding in the table the number whose logarithm is the quotient.

Find the 30th root of 5.74354.

$$\log 5.74354 = .75918$$
$$.75918 \div 30 = .02531$$
$$\log^{-1} .02531 = 1.06$$

which is the 30th root of 5.74354.

TABLE OF LOGARITHMS.—Following is a five-place table of common logarithms.

Interest

DEFINITION.—Interest is expense or income resulting from the use of wealth over a period of time. It results in an increase of indebtedness or of investment according as the money or credit is borrowed or loaned. When interest is reckoned only on the original indebtedness, it is simple interest; when it is added to the principal and increases the indebtedness, it is compound interest.

COMPUTING SIMPLE INTEREST.—In computing simple interest, take the rate of 6%, which is the common rate and a factor of 12, the number of months in a year, and of 30, the number of days in a month, and make adjustments for higher or lower rates. It is customary to consider 360 days in the year, but when desirable to take the exact number of 365 days, adjustments must be made for the difference. A rate of 6% per annum is equivalent to a rate of 1% for 2 months, or, expressed as a decimal, .01. Hence, the interest on any amount at 6% for 2 months can be secured by moving the decimal point two places to the left. Interest for 6 days can be secured by moving the decimal point three places to the left, because 6 is 1/10 of 60. According to this principle the interest on $9,821.40 at 6% for

6	days is $		9.82
60	"	"	98.21
600	"	"	982.14
6,000	"	"	9,821.40

If the number of days is such that it can be separated into parts each of which is a fraction or multiple of 6, the interest may be figured by totaling the interest computed for these parts.

Illustration.—To find the interest on $847.15 for 108 days:

$ 8.472	interest	for	60	days
4.236	"	"	30	"
1.412	"	"	10	"
.847	"	"	6	"
.282	"	"	2	"
$15.249	"	"	108	"

When the principal is a factor or multiple of 6, interchange principal and days. The interest on $4,800 for 27 days is the same as the interest on $27 for 4,800 days. The interest on $27 for 60 days equals $0.27, secured by moving the decimal point two places to the left. Multiplying $0.27 by 80 gives $21.60, the interest on $27 for 4,800 days, or its equivalent, the interest on $4,800 for 27 days.

Alternative Method.—When neither of the above methods can be employed, the following rule may be applied:

Rule.—1. Secure the interest for 6 days at 6% by pointing off 3 places in the principal.

2. Multiply this result by the number of days interest is reckoned, which gives interest for six times the required number of days.

3. Divide this result by 6.

Illustration.—To find the interest on $942.52 for 19 days at 6%:

$ .94252 interest for 6 days
19

848268
94252

$17.90788 interest for 114 days

$17.90788 ÷ 6 = $2.98465 interest for 19 days

When the rate is other than 6%, the interest should be found at 6% and the amount thus found adjusted to the required rate. Thus, interest on $942.52 for 19 days at 5% is equal to 5/6 of $2.98465, the amount computed above, which gives $2.4872.

When interest has been computed on the basis of 360 days as in preceding illustrations, and it is desired to adjust it to a 365-day basis, the amount of the interest should be decreased by 1/73 of itself, because the difference of 5 days is 1/73 of 365. Thus, to find the exact interest on $942.52 for 19 days at 6%, take the amount computed on a 360-day basis shown above as $2.98465, and from this amount deduct 1/73 of itself, which leaves $2.94377 as the interest for the given time and rate on a 365-day basis.

Explanation of reason why 1/73 is subtracted from ordinary interest:

1 day's int. on 360-day basis is 1/360 of year's int.
" " " " 365-day " " 1/365 " " "
1 day's exact int.: 1 day's ordinary int. = 1/365 : 1/360
or as 1/73 : 1/72 = 1/73 × 72/1 = 72/73
or, exact int.: Ordinary int. = 72 : 73

INTEREST IN CASE OF PARTIAL PAYMENTS.—When partial payments are made on a debt, one of two rules may be followed in calculating interest.

The **Merchants' Rule** requires the calculation of interest on the principal

sum from date the debt begins to date of final settlement; also calculation of interest on each partial payment from date of payment to date of final settlement. The interest due is the difference between the interest on the principal sum to date of final settlement and the sum of the amounts of interest calculated on the partial payments as indicated above. This rule may be regarded as being sufficiently accurate on small sums and for short periods.

The **United States Rule** gives precedence to the interest due at time of each payment, and requires that each payment be applied first to liquidate interest then due. The remainder after deducting interest is applied to the reduction of the principal. If the payment is not sufficient to liquidate the interest then due, it is applied against it, but the unliquidated interest is not added to the principal, as it is in case of compound interest, but is carried forward and added to the interest which is deducted from the next payment.

Illustration.—The following example illustrates the difference between the two methods:

Jan. 1, original amount	$6,000
Feb. 1, payment	2,000
Mar. 1, "	2,000
June 1, "	1,000

Interest is charged at the rate of 6%. Required to find the amount due July 1.

Solution according to Merchants' Rule:

Interest on $6,000 for 6 mo.		$ 180.00
" " 2,000 " 5 "	$50.00	
" " 2,000 " 4 "	40.00	
" " 1,000 " 1 "	5.00	95.00
Interest due July 1		$ 85.00
Unpaid principal		1,000.00
Total due July 1		$1,085.00

Solution according to United States Rule:

Original debt		$6,000.00
Payment Feb. 1	$2,000.00	
Deduct interest on $6,000 for 1 mo.	30.00	1,970.00
		$4,030.00
Payment Mar. 1	$2,000.00	
Deduct interest on $4,030 for 1 mo.	20.15	1,979.85
		$2,050.15
Payment June 1	$1,000.00	
Deduct interest on $2,050.15 for 3 mo.	30.75	969.25
		$1,080.90
Interest on $1,080.90 for 1 mo.		5.40
Total due July 1		$1,086.30

The Merchants' Rule gives a result which is $1.30 less than the result secured by the United States Rule. The latter rule should be followed where sums are large or the period of time is considerable.

COMPOUND INTEREST.—The principles of compound interest are frequently applied in computations of bond discount and premium, sinking funds, application of depreciation methods, and the various problems of actuarial science. Compound interest as such is illegal, that is, it cannot be provided for in a negotiable instrument. Nevertheless there can be no objection to adding it to the principal at the end of an interest period and thus accomplishing the same result as if it were provided for in advance. In the computations which follow, the symbols which have become standardized in works on accounting are employed. These are as follows:

1 = the unit of value, as, \$1 or £1.
i = rate of interest per period.
n = number of periods.
a = amount of \$1 for a given time at a given rate.
I = compound interest on \$1 for a given time at a given rate.
p = present worth of \$1 for a given time at a given rate.
D = compound discount on \$1 for a given time at a given rate.
r = $(1 + i)$, periodic rate of increase.

In making compound interest computations, it is customary to compute the amount of \$1 for the given time at a given rate, and then multiply the result by the principal sum as expressed in dollars. Thus, to find the amount of \$1 for 4 years at 6% compound interest, we multiply the principal sum by the ratio of increase as many times as there are accounting periods. The ratio of increase is expressed in general terms as $(1 + i)$, 1 representing \$1 and i the rate of interest. If i is 6%, or .06, then the ratio of increase is 1.06.

Solution:

	\$1.00	
Multiplied by	1.06	
equals	\$1.06	amt. of \$1 for 1 yr. at 6%
Multiplied by	1.06	
equals	\$1.1236	" " \$1 " 2 yr. " 6%
Multiplied by	1.06	
equals	1.191016	" " \$1 " 3 yr. " 6%
Multiplied by	1.06	
equals	\$1.262477	" " \$1 " 4 yr. " 6%

Since the amount is increased each accounting period by $(1 + i)$, the process may be expressed in general terms by saying that if we start with a principal sum of 1, then the amount at the end of each succeeding year, at compound interest, will be:

1 yr. $(1 + i)$
2 " $(1 + i)^2$
3 " $(1 + i)^3$
4 " $(1 + i)^4$
5 " $(1 + i)^5$
n " $(1 + i)^n$

and the general formula for compound interest is:

$$a = (1 + i)^n$$

a being the amount of 1 for n periods of time, at i rate of interest. Thus,

to find the amount of \$125 at 6% for 18 years, compounded yearly, the amount of \$1 is found thus:

$$a = (1.06)^{18}$$

and this is multiplied by 125.

The interest may be compounded at shorter periods than 1 year. The same formula applies, but i in the formula is no longer the annual rate, but the annual rate divided by the number of periods represented by 1 year. Thus, if the rate is 6% per year and interest is compounded semiannually, i becomes .03; if interest is compounded quarterly, i becomes .015; if monthly, i becomes .005; and so on.

Thus, to find the amount of \$100 at 6% for 20 years, interest compounded quarterly, i is $6 \div 4$, or .015; and n, the number of periods, is 80. Substituting these values in the formula

$$a = (1 + i)^n$$

$$\text{we have } a = (1.015)^{80} = 3.29066$$

$$\$100 \times 3.29066 = \$329.066, \textit{ answer}$$

USE OF INTEREST TABLES, LOGARITHMS, ETC.—Interest tables are found on page 132. They show the amount of \$1 at given rates of interest for given periods of time. Having found the amount of \$1 at the given rate for the given time, the amount of the required principal for that time and rate is ascertained by multiplying it by the amount of \$1. Thus, in ascertaining the amount of \$27 in 8 years, interest at 5% compounded annually, it is found in the table on page 134, that the amount of \$1 for this time and rate is \$1.47745544, which multiplied by 27 gives \$39.891296 as the answer. When an interest table is not available, logarithms may be used to make the necessary computations. When neither logarithms nor an interest table is available, the desired power may be computed by the ordinary process of multiplication.

Illustration.—If it is desired to find the 5th power of 1.06, it may be computed as follows:

$$\begin{array}{ll}
1.06 & \\
1.06 & \\
\hline
1.1236 & = (1.06)^2 \\
1.06 & \\
\hline
1.191016 & = (1.06)^3 \\
1.06 & \\
\hline
1.26247696 & = (1.06)^4 \\
1.06 & \\
\hline
1.3382255776 & = (1.06)^5
\end{array}$$

If the full number of decimal places is carried, the computation becomes too laborious and it is therefore necessary to round off the figure at about the sixth decimal, in which case the above figure becomes

$$1.338226$$

and the computation may then be continued, the required number of decimals being dropped each time.

This procedure may be shortened, in case the number of periods is large, by multiplying, not by the ratio of increase but by some power of that ratio.

If, for example, we know the value of $(1 + i)^2$, multiplying by that amount is equivalent to multiplying by $(1 + i)$ twice; likewise, multiplying by $(1 + i)^4$ is equivalent to multiplying by $(1 + i)$ four times because $(1 + i)$ is contained four times as a factor in $(1 + i)^4$. The process is illustrated below:

$$\begin{array}{ll} 1.04 & = (1+i) \\ 1.04 & = (1+i) \\ \hline 1.0816 & = (1+i)^2 \\ 1.0816 & = (1+i)^2 \\ \hline 1.169859 & = (1+i)^4 \end{array}$$

$(1.04)^6 = (1.04)^2 \times (1.04)^4$, and other similar combinations may be made.

PRESENT WORTH—The present worth of a sum of money due at a fixed future date is that sum which, at compound interest, will amount to such sum at such date. Thus, if interest is 6%, \$1 is the present worth of \$1.06 due in 1 year. If p is the present worth of \$1 due in 1 year, then $p \times 1.06 = \$1$, or in general terms, $p \times (1 + i) = 1$. It follows that $1 \div (1 + i) = p$. Likewise, the present worth of 1 due 2 years hence, or p is

$$1 \div (1+i)^2$$

and for n periods hence is

$$1 \div (1+i)^n$$

or, $p = 1 \div (1+i)^n$

Therefore, $p = 1 \div a$

a being the amount of 1 for the given time at the given rate, compound interest.

On page 138 is shown a table of present values of \$1 for various rates and periods. The present value of a given sum due at a fixed future period at a given rate of interest, can be secured by first finding the present value of \$1 for that period and rate, and then multiplying this by the sum whose present worth it is desired to ascertain. Suppose it is desired to find the present worth of \$57 due in 15 years at 5% compound interest. The table on page 138 shows the present worth of \$1 at this rate and for this time to be \$0.48101710. The present worth of \$57 is, therefore, \$57 × .48101710 = \$27.4179747.

COMPOUND DISCOUNT.—The difference between a sum due at a fixed time in the future and its present worth is called compound discount. It may be computed by the formula

$$D = 1 - p$$

D being the compound discount and p being the present worth of 1. The present value and discount on \$1 for various periods at 6% are shown below:

Periods	Present Value	Discount
1	\$0.94339623	\$0.05660377
3	0.83961928	0.16038072
5	0.74725817	0.25274183
95	0.00294723	0.99705277

For present values at all ordinary rates and for all usual periods of time, consult the table of present values on page 138. Other formulas for finding compound discount are:

$$D = I \div (1+i)^n$$

in which i is the interest rate and n the number of periods; also,

$$D = I \div a$$

in which I is the compound interest on $1 for the given time at the given rate, and a is the amount of $1 for the given time at the given rate.

SUMMARY OF COMPOUND INTEREST PROCESSES.—The following rules and formulas are reproduced from Sprague and Perrine's "Accountancy of Investment":[5]

Rules:

1. To find the ratio of increase:
   Add 1 to the rate of interest.
2. To find the amount of $1:
   Multiply 1 by the ratio as many times as there are periods.
3. To find the present worth of $1, or to discount $1:
   Divide 1 by the ratio as many times as there are periods.
4. To find the total interest on $1:
   Subtract 1 from the amount.
5. To find the total discount on $1:
   Subtract the present worth from 1.
6. To find the amount of annuity of $1:
   Divide the total interest by the rate of interest.
7. To find the present worth of an annuity of $1:
   Divide the total discount by the rate of interest.
8. To find the rate of an annuity worth $1, or what annuity can be bought for $1:
   Divide 1 by the present worth of the annuity.
9. To find what annuity (sinking fund) will produce $1:
   Divide 1 by the amount of the annuity.
10. To find the premium on a bond, or the discount on a bond:
    Consider the difference between the cash and income rates as an annuity to be valued, and find its present worth at the income rate.
11. To find the value of a bond:
    In case the cash rate is greater than the income rate, the bond is at a premium; therefore, add par to the premium.
    In case the income rate is greater than the cash rate, the bond is at a discount; therefore, subtract the discount from par.

Formulas.—i is the rate of interest on unity for one period. n is the number of periods. c is the cash rate on a bond.

1. Ratio of increase $= 1 + i$
2. Amount $= (1 + i)^n$
3. Present worth $= \dfrac{1}{(1 + i)^n}$
4. Total interest $= (1 + i)^n - 1$
5. Total discount $= 1 - \dfrac{1}{(1 + i)^n}$
6. Amount of annuity $= \dfrac{(1 + i)^n - 1}{i}$

[5] Pp. 120–122.

7. Present worth of annuity $= \dfrac{1 - \dfrac{1}{(1+i)^n}}{i}$

8. Rent of annuity $= \dfrac{i}{1 - \dfrac{1}{(1+i)^n}}$

9. Sinking fund $= \dfrac{i}{(1+i)^n - 1}$

10. Premium on bond $= \dfrac{c-i}{i}\left(1 - \dfrac{1}{(1+i)^n}\right)$

11. Discount on bond $= \dfrac{i-c}{i}\left(1 - \dfrac{1}{(1+i)^n}\right)$

12. Value of bond (at a premium) $= 1 + \dfrac{c-i}{i}\left(1 - \dfrac{1}{(1+i)^n}\right)$

13. Value of bond (at a discount)[6] $= 1 - \dfrac{i-c}{i}\left(1 - \dfrac{1}{(1+i)^n}\right)$

Annuities

ANNUITY DEFINED.—An annuity is a series of equal payments due at regular intervals. The interval may be of any length of time—year, half-year, quarter, or month.

TWO FUNDAMENTAL PROBLEMS.—There are two fundamental problems in annuities. One is to ascertain the amount to which a series of equal payments due at regular intervals will accumulate. The other is to ascertain the investment which, with interest accumulations, will permit the withdrawal of rents of given amounts at regular intervals of time.

AMOUNT OF AN ORDINARY ANNUITY.—An ordinary annuity is one whose instalments or rents are due at the end of each period. Consequently, the last one bears no interest. The amount of an ordinary annuity of 1 per period for n periods is represented by the symbol S_n.

The **present value** of an ordinary annuity of 1 per period for n periods is represented by the symbol A_n.

Rule.—To find the amount of an ordinary annuity of 1 for a given number of periods at a given rate, divide the compound interest on 1 for the given number of periods and at the given rate by the simple interest rate. Expressed as a formula we have:

$$S_n = I \div i$$

Illustration.—The following payments are required to be made to a sinking fund at the dates indicated:

Jan. 1, 1918	$200
" 1, 1919	200
" 1, 1920	200
" 1, 1921	200
" 1, 1922	200

To what amounts will these payments accumulate at Jan. 1, 1922, if each instalment is invested at once at 4% per annum?

[6] This formula is equivalent to formula 12.

$$1.04^5 = 1.216653$$

Therefore $I = .216653$

$S_5 = .216653 \div .04 = 5.4163$, the amount of an annuity of 1 for 5 periods at 4%.

$5.4163 \times 200 =$ \$1,083.26, the amount of an annuity of 200 for 5 periods at 4%.

The manner in which this annuity accumulates is shown by following computation:

Jan. 1, 1918	Instalment	\$ 200.00
" 1, 1919	Interest at 4% on \$200.00	8.00
	Instalment	200.00
		\$ 408.00
" 1, 1920	Interest at 4% on \$408.00	16.32
	Instalment	200.00
		\$ 624.32
" 1, 1921	Interest at 4% on \$624.32	24.97
	Instalment	200.00
		\$ 849.29
" 1, 1922	Interest at 4% on \$849.29	33.97
	Instalment	200.00
	Total	\$1,083.26

On page 140 is a table which shows the amount of an annuity of \$1 at various rates of interest for various periods of time. Having found the amount of an annuity of \$1 for the given time at the given rate, the amount of an annuity for the desired sum can be found by multiplying the amount of the annuity of \$1 by such sum.

AMOUNT OF AN ANNUITY DUE.—An annuity due is one whose instalments or rents are due at the beginning of each period. Consequently, all instalments bear interest. It follows that an annuity due of a given sum, at a given rate, and for a given number of periods, will accumulate interest for a full period longer than will an ordinary annuity of the same sum, at the same rate, and for the same number of periods. This means that the excess of the amount of the annuity due will be larger than the amount of the ordinary annuity by the ratio of increase, or $1 + i$. The formula for finding the amount of an annuity due is:

$$S_n = (I \div i) \times (1 + i)$$

Consequently, the amount of an annuity due can be determined by first finding the amount of an ordinary annuity, and then multiplying this amount by the ratio of increase.

Illustration.—The following payments are required to be made to a sinking fund which is to be allowed to accumulate until 1 year after the last instalment is paid in.

Jan. 1, 1918	\$200
" 1, 1919	200
" 1, 1920	200
" 1, 1921	200
" 1, 1922	200

To what amount will these payments accumulate at Jan. 1, 1923, if each instalment is invested at once at 4% per annum? The amount of an ordinary annuity for this sum, rate, and time as found on page 142, is $1,083.26. Multiplying this sum by the ratio of increase, 1.04, gives $1,126.59 as the amount of an annuity due of $200, for 5 years, at 4%. The manner in which this annuity accumulates is shown below:

Jan. 1, 1918		$ 200.00
" 1, 1919	Interest at 4% on $200.00	8.00
	Instalment	200.00
		$ 408.00
" 1, 1920	Interest at 4% on $408.00	16.32
	Instalment	200.00
		$ 624.32
" 1, 1921	Interest at 4% on $624.32	24.97
	Instalment	200.00
		$ 849.29
" 1, 1922	Interest at 4% on $849.29	33.97
	Instalment	200.00
		$1,083.26
" 1, 1923	Interest at 4% on $1,083.26	43.33
	Total	$1,126.59

SINKING FUNDS.—When sinking funds are accumulated by periodical contributions, the problem is to find what sum invested periodically will accumulate to the required amount, at a given rate of interest, and over a given number of periods. This periodical contribution is determined by finding the amount of an annuity of $1 for the given number of periods at the given rate of interest, and then dividing the amount of the required fund by the amount of an annuity of $1. Periodical contributions to sinking funds are usually deposited at the end of the period; consequently the divisor employed is the amount of an ordinary annuity of $1. If S. F. represents the sinking fund to be established and if S. F. C. represents the periodical contribution to be made to the sinking fund, then

$$\text{S. F. C.} = \text{S. F.} \div S_n$$

S_n being the amount of an ordinary annuity of $1.

Illustration.—A company desires to accumulate a fund of $50,000 in 6 years. If money put into the fund accumulates at the rate of 4% per annum, what must be the amount of each yearly contribution, the first being made at end of the 1st year?

From the table on page 142, we find that the amount of an ordinary annuity of $1 for 6 periods at 4% is $6.632975. Therefore,

$$\begin{aligned}\text{S. F. C.} &= \$50{,}000 \div 6.632975 \\ &= \$7{,}538.10\end{aligned}$$

The manner in which this annuity accumulates to the required amount is shown in the following table:

End of 1st year:		
Instalment		$ 7,538.10
End of 2nd year:		
Interest on $7,538.10 at 4%	$ 301.52	
Instalment	7,538.10	7,839.62
		$15,377.72
End of 3rd year:		
Interest on $15,377.72 at 4%	$ 615.12	
Instalment	7,538.10	8,153.22
		$23,530.94
End of 4th year:		
Interest on $23,530.94 at 4%	$ 941.24	
Instalment	7,538.10	8,479.34
		$32,010.28
End of 5th year:		
Interest on $32,010.28 at 4%	$1,280.41	
Instalment	7,538.10	8,818.51
		$40,828.79
End of 6th year:		
Interest on $40,828.79 at 4%	$1,633.15	
Instalment	7,538.10	9,171.25
		$50,000.04

If the contributions are to be made to the sinking fund at the beginning of each period, the amount which is to be accumulated should be divided by the amount, not of an ordinary annuity, but of an annuity due. Thus, in the preceding illustration, if the deposits are to be made to the sinking fund at the beginning of each of the 6 years during which it accumulates, in order to find the amount of each contribution we must divide 50,000, not by 6.632975, but by $6.632975 \times 1.04 = 6.898294$. $50{,}000 \div 6.898294 =$ $7,248.17.

The manner in which the sinking fund will then accumulate is shown below·

1st year:		
Beginning:	Instalment	$ 7,248.17
End:	Interest on $7,248.17 at 4%	289.93
		$ 7,538.10
2nd year:		
Beginning·	Instalment	7,248.17
		$14,786.27
End:	Interest on $14,786.27 at 4%	591.45
		$15,377.72

3rd year:			
Beginning:	Instalment		7,248.17
			$22,625.89
End:	Interest on $22,625.89 at 4%		905.04
			$23,530.93
4th year:			
Beginning:	Instalment		7,248.17
			$30,779.10
End:	Interest on $30,779.10 at 4%		1,231.16
			$32,010.26
5th year:			
Beginning:	Instalment		7,248.17
			$39,258.43
End:	Interest on $39,258.43 at 4%		1,570.34
			$40,828.77
6th year:			
Beginning:	Instalment		7,248.17
			$48,076.94
End:	Interest on $48,076.94 at 4%		1,923.07
	Total		$50,000.01

Sometimes the interest on the sinking fund is compounded more frequently than the contributions are made to it. Thus, the contributions may be made yearly, whereas the interest may be compounded semiannually, quarterly, or monthly. Under these conditions it must be remembered that the nominal and effective rates are different.

Illustration.—A company establishes a sinking fund by contributing to it annually $200, payable at the end of the year. To what sum will these accumulate if they are invested at 4% and the interest is compounded semiannually?

Here the rate is not 4% per annum, but 2% per half-year; therefore the ratio of increase is 1.02 each 6 months, or 1.02^2 per annum. $1.02^2 = 1.0404$ the ratio of increase per annum. The effective yearly interest rate is, therefore, 1.0404%.

The amount of $1 in 4 years at 2% a half-year is $1.02^8 = \$1.171659$. The compound interest is $0.171659. To find the amount of an annuity of $1, divide the compound interest, $0.171659, by the effective interest rate, .0404, which gives as a result $4.249. Therefore, the amount of an annuity of $200 = 200 × 4.249 = $849.80. The manner in which this accumulation takes place is shown in the following computations:

1st year:			
End:	Instalment		$200.00
2nd year:			
Middle:	Interest on $200.00	$ 4.00	
End:	" " 204.00	4.08	8.08
	Instalment		200.00
			$408.08

3rd year:			
Middle: Interest on $408.08	$ 8.16		
End: " " 416.24	8.32	16.48	
Instalment		200.00	
		$624.56	
4th year:			
Middle: Interest on $624.56	$12.49		
End: " " 637.05	12.74	25.23	
Instalment		200.00	
Total		$849.79	

Should the instalments be made payable at the beginning of each year instead of at the end, the amount is computed as above and then multiplied by the ratio of increase. Thus, in the above illustration the ratio of increase is 1.0404, and to find the amount of the annuity if the instalments are payable at the beginning of each year, $849.79 is multiplied by 1.0404 = $884.12.

PRESENT WORTH OF AN ANNUITY.—It is sometimes necessary to find what sum invested and allowed to accumulate at compound interest will produce a certain number of rents of a given amount and to be withdrawn from the fund at given intervals of time. The amount in the fund at the time the last rent is payable should be exactly sufficient to provide for its payment.

Illustration.—A concern wishes to invest a sum of money on Jan. 1, 1922, which, accumulating at the rate of 4% per annum, will just enable it to make four payments of $200 each on Jan. 1, 1923, Jan. 1, 1924, Jan. 1, 1925, and Jan. 1, 1926, respectively. The following rule should be followed:

To determine the present value of an annuity of 1 for a given number of periods at a given rate of interest, divide the compound discount on 1 for the given number of periods by the given interest rate. If A_n represents such present value, then

$$A_n = D \div i$$

D being the compound discount and i the interest rate.

From the table on page 138, it is found that the present value of 1 at 4% due 4 periods hence is .854804. The compound discount is $1 - .854804 = .145196$. Dividing .145196 by .04, the rate of interest, gives 3.6299 as the present value of an annuity of 1 for 4 periods at 4%. $3.6299 \times \$200 = \$725.98$, the present value of an annuity of $200 for 4 years at 4%. The manner in which this accumulation and reduction takes place is shown below:

Jan. 1, 1922 Investment (present value)	$725.98
" " 1923 Interest on $725.98 at 4%	29.04
	$755.02
Payment deducted	200.00
	$555.02
" " 1924 Interest on $555.02 at 4%	22.20
	$577.22
Payment deducted	200.00
	$377.22

Jan. 1, 1925	Interest on $377.22 at 4%	15.09
		$392.31
	Payment deducted	200.00
		$192.31
" " 1926	Interest on $192.31 at 4%	7.69
		$200.00
	Payment deducted	200.00
		$ 0.00

PRESENT WORTH OF AN ANNUITY DUE.—When the payments are to be made at the beginning instead of the end of each period, the invested sum draws no interest before the first rent is deducted. The present worth of an annuity due can be determined by multiplying the present value of an ordinary annuity for the same number of payments and at the same rate of interest by the ratio of increase, $1+i$. Thus, in the illustration of the present worth of an ordinary annuity on page 124, we have $725.98 given as the present value. The ratio of increase is 1.04. Multiplying 725.98 by 1.04 gives $755.02 as the present value of an annuity due of $200 payable in 4 annual instalments of $200 each. The manner in which this sum accumulates and is reduced by the 4 yearly payments is shown below:

Jan. 1, 1922	Investment (present value)	$755.02
	Payment deducted	200.00
		$555.02
Jan. 1, 1923	Interest on balance, $555.02 at 4%	22.20
		$577.22
	Payment deducted	200.00
		$377.22
Jan. 1, 1924	Interest on balance, $377.22 at 4%	15.19
		$392.41
	Payment deducted	200.00
		$192.41
Jan. 1, 1925	Interest on balance, $192.41, at 4%	7.70
		$200.11
	Payment deducted	200.00
		$ .11

DEFERRED ANNUITIES.—It is sometimes desired to find the present value of an annuity which will not begin to run until after several periods

have elapsed. Thus, an annuity of 4 payments deferred 8 periods does not begin to run until 8 periods have expired.

Illustration.—In the illustration given on page 124, it is shown that the present value of an ordinary annuity of $200, due in 4 payments at 4% per year, is $725.98. What is the present value of such an annuity if it is deferred 8 years, that is, if the first annuity payment is made 9 years from the date on which the sum representing the present worth is invested?

Since the annuity is deferred 8 years, the investment will earn interest for 8 years before the annuity begins to run. If $725.98 invested at the beginning of the 9th year will produce the required annuity, the investment at the beginning of the 1st year is the present worth of $725.98 due at the end of 8 years. The present value of 1 due in 8 periods at 4% is 0.730690 as per table on page 138; therefore the present value of $725.98 is $\$725.98 \times 0.730690 = \$530.47$, which amount, invested at compound interest will amount to $725.98 in 8 years, because $1.04^8 = 1.368569$ and $\$530.47 \times 1.368569 = \$725.98$.

PRICE OF BONDS.—Various factors combine to determine the selling price of a bond. These are: the financial status of the issuing company, the condition of the money market, the security, the interest rate, and so on. Bonds usually sell either at a discount or at a premium, and when such is the case the effective interest rate differs from the nominal rate. When a bond is sold below par, i.e., at a discount, the sum received is less than par, so that the effective interest rate is higher than the nominal interest rate. If, on the other hand, the bond sells above par, i.e., at a premium, the sum received by the seller is greater than the par value of the bond, so that the effective interest rate realized by the purchaser is less than the nominal interest rate.

When bond quotations are made "on a basis," the effective rate to be earned is stated. Given this and the nominal rate, the price may be computed from a bond table. From the following table we find that a 5-year 6% bond bought on a 5% basis costs $104.38, and that a 5-year 7% $100 bond bought on a 5% basis costs $108.75.

Bond Table

Five Years—Interest payable semiannually

Per Cent per Annum	3%	3½%	4%	4½%	5%	6%	7%
4.75	92.29	94.49	96.70	98.90	101.10	105.51	109.91

5.625	88.70	90.85	93.00	95.16	97.31	101.61	105.92
5.75	88.20	90 34	92.49	94.62	96.78	101.07	105.37
5.875	87.70	89.84	91.98	94.12	96.26	100.53	104.81
6.00	87.20	89.34	91.47	93.60	95.73	100.00	104.27

Several bond tables are published giving prices for all usual terms and rates. See additional illustration on page 162.

COMPUTING BOND PREMIUM.—When the effective interest rate is lower than the nominal rate, the premium is computed by a method illustrated below:

If the par value is $1,000, the term 5 years, the nominal rate 6% payable semiannually, and the bond is to be bought on a 5% basis, the buyer is to receive a return of 5% per annum. If it bore coupons of 2½% each payable each 6 months, the bond would be bought at par. But the coupons are $30 each, and this extra $5 each 6 months is an annuity for which the buyer pays the present value discounted at the effective interest rate of 2½% per period, determined thus:

.781198 = present value of 1 at 2½% for 10 periods.
.218802 ÷ .025 = 8.75208 present value of annuity of 1.
8.75208 × 5 = 43.76040 present value of annuity of 5, the premium.
Therefore the basis price to be paid is $1,043.76.

COMPUTING BOND DISCOUNT.—The discount on a bond may be computed by finding the difference between the interest on par at the effective rate and the nominal rate, and then finding the present value of an annuity for the number of interest periods, each rent of which is the difference in the interest at the two rates. This is done by discounting the annuity at the effective interest rate.

Illustration.—Assume a $1,000 5-year 5% bond which is to be sold to net the investor 6%, interest being payable semiannually.

Effective rate is 3% on $1,000 = $30
Nominal rate is 2½% on $1,000 = 25

Difference = $ 5

Present value of 1 at 3% due in 10 periods = .744094
Compound discount = .255906
Present value of annuity of 1 = .255906 ÷ .03 = 8.5302
5 × 8.5302 = 42.6510, the discount
1,000 − 42.65 = 957.35, the price

LEGAL INTEREST RATES.—The following table gives the statutory provisions of the various states regarding interest rates.

Legal Rate of Interest Table

	%		%
Alabama	8		
Arizona	6	Parties may agree on any rate not exceeding	10
Arkansas	6	" " " " " " " "	10
California	7	" " " " " " " "	12
Colorado	8	Parties may agree on any rate not exceeding 12% per annum if the principal is not over $300. Parties may agree on any rate on larger loans.	
Connecticut	6	Loans at greater rate than 12% prohibited except that pawnbrokers may charge special rates.	
Delaware	6	Parties may agree in writing on any rate where loan exceeds $5,000 on accepted collateral security. Vol. 28, Laws of Delaware, p. 632.	

Legal Rate of Interest Table—Continued

	%		%
Dist. of Columbia	6	Parties may agree in writing on any rate not exceeding	8
Florida	8	" " " " " " " " " "	10
Georgia	7	" " " " " " " " " "	8
Idaho	7	" " " " " " " " " "	10
		Parties may agree in writing for the payment of compound interest if the rate of interest on interest does not exceed the maximum allowed by law (10%) and the aggregate of the interest and compound interest does not exceed such maximum rate on the principal.	
Illinois	5	Parties may agree on any rate not exceeding	7
Indiana	6	" " " " " " " "	8
Iowa	6	" " " " " " " "	8
Kansas	6	" " " " " " " "	10
Kentucky	6		
Louisiana	5	Parties may agree on any rate not exceeding	8
Maine	6	Parties may agree on any rate.	
Maryland	6	3½% per month on petty loans of $300 or less made by specially licensed loan agencies.†	
Massachusetts	6	Parties may agree on any rate.	
Michigan	5	" " " " " " not exceeding	7
Minnesota	6	" " " " " " " "	10
Mississippi	6	" " " " " " " "	8
Missouri	6	" " " " " " " "	8
Montana	8	" " " " " " " "	10
Nebraska	7	" " " " " " " "	10
*Nevada	7	" " " " " " " "	12
New Hampshire	6		
New Jersey	6		
New Mexico	6	Parties may agree on any rate not exceeding	10
		Where there is no collateral security for loan	12
New York	6	Special exceptions in favor of call loans in amounts over $5,000; and in favor of bankers.†	
North Carolina	6		
North Dakota	6	Parties may agree on any rate not exceeding	10
		Rate shall be same after maturity of indebtedness as before maturity. Attempted increase void.	
Ohio	6	Parties may agree on any rate not exceeding	8
Oklahoma	6	" " " " " " " "	10
Oregon	6	" " " " " " " "	10
Pennsylvania	6	Special provisions licensed money lenders.	
Rhode Island	6	Parties may agree on any rate not exceeding	30
South Carolina	7	" " " " " " " "	8
South Dakota	7	" " " " " " " "	10
Tennessee	6	" " " " " " " "	8
Texas	6	" " " " " " " "	10
Utah	8	" " " " " " " "	12
Vermont	6		
Virginia	6	Bankers, brokers and moneyed corporations may loan money or discount at not exceeding ½ of 1% for 30 days, minimum fee 50c. Exceptions in favor of insurance companies loaning money at 6% on insurance policies.	
Washington	6	Parties may agree on any rate not exceeding	12
West Virginia	6		
Wisconsin	6	Parties may agree on any rate not exceeding	10
Wyoming	8	" " " " " " " "	12

N.B.—In states where parties may agree on higher than legal rate, it is not sufficient to print on invoice such words "interest at rate of 1 per cent a month charged on past due accounts," for a contract is not created thereby.

* Where there is no express contract in writing regulating the rate of interest, the legal rate is 7% upon all claims except book accounts, and interest runs from the time the debt became due. In the case of book accounts interest commences to run from the day the accounts are settled and the balance ascertained.

† Corporations are precluded in Maryland and New York from setting up usury as a defense.

Average

DEFINITION.—An average is a figure or sum which is representative of a series. It is employed, for sake of brevity, in calculations, and makes possible comparisons of two or more series representing numerous and varied observations.

A **simple average** is found by adding the units to be averaged and dividing by the number of the units.

A **weighted average** is one which takes into account not merely the number of units to be averaged, but also makes allowance for the value of each unit.

A **moving average** makes use of the simple average in a time series where the units of time are of uniform duration and uninterrupted sequence. The moving average is determined by taking a simple average of as many units of the time series as is desired as a starting point; then, after the lapse of each time unit, dropping the first unit in the series and adding the next in order of time, in each instance finding the simple average.

A **progressive average** is one secured by finding a series of simple averages, the dividend being increased each time by adding a new unit and the divisor being increased each time by 1.

In each of the above definitions the average is secured by dividing by the number of units in the series. These are all arithmetic averages or **means.** Sometimes, however, it is desirable to employ the **mode** or the **median** as being more representative than the **mean.** The **mode** is that unit in a series which is most typical of the series. The **median** is the unit which stands midway between the extreme units in the series. The mode is always represented in the series, but the median is represented by an actual unit only when the number of units in the series is odd.

SIMPLE AVERAGE ILLUSTRATED.—Innumerable illustrations of simple averages may be found. Thus, in determining the value of good-will of an enterprise, it is customary to take a simple average of profits over a period of the past 4 or 5 years, and then determine how much this average is in excess of a fair rate of return on invested capital and a fair allowance for managerial services. This excess is then capitalized at a given number of years' purchase.

Again, suppose it is desired to find the average monthly sales of a business, the amounts for each of 12 months being as follows:

Jan.	$ 5,827.21
Feb.	4,312.17
Mar.	4,877.89
Apr.	4,998.21
May	5,121.12
June	4,653.19
July	3,121.10
Aug.	3,336.81
Sept.	4,827.64
Oct.	4,912.11
Nov.	5,227.67
Dec.	6,418.10
Total for year	$57,633.22

$57,633.22 ÷ 12 = $4,802.77, average monthly sales.

WEIGHTED AVERAGE ILLUSTRATED.—Sometimes the items which enter into an average differ in more than one respect. Thus, if we invest \$1,000 at 5%, \$2,000 at 6%, and \$4,000 at 7%, we cannot find the average return by adding 5, 6, and 7 together and dividing by 3, but we make allowance for the amounts which draw these rates, respectively. This we do by multiplying the amount invested by the rate. We then find the average rate by dividing this product by the total amount invested. This is shown below:

Investment	Rate	Product
\$1,000	5%	\$ 50
2,000	6%	120
4,000	7%	280
\$7,000		\$450

450 ÷ 7,000 = 6.429%, the weighted average rate of return.

MOVING AVERAGE ILLUSTRATED.—The following figures represent the monthly sales of a concern for a 2-year period expressed in round numbers:

	1920	1921
Jan.	\$12,000	\$17,500
Feb.	11,500	16,000
Mar.	11,700	17,000
Apr.	12,000	18,000
May	11,000	18,500
June	13,000	19,000
July	12,500	19,000
Aug.	14,000	19,500
Sept.	15,000	22,000
Oct.	16,000	26,000
Nov.	16,500	27,000
Dec.	18,000	30,000

Taking the year as the basis, first find the average for the 12 months, Jan. to Dec., 1920, which amounts to \$13,600. Next find the average for the 12-month period, Feb. 1920, to Jan. 1921. That is, Jan. 1920 is dropped from the computation, while Jan. 1921 is included. The average is then found to be \$14,058.33. This process is continued, each time 1 month being dropped at the beginning and one added at the end of the yearly period, until Dec. 1921 is included. The following series is the result:

Period (dates inclusive)	Moving Average
Jan. 1920 – Dec. 1920	\$13,600.00
Feb. " – Jan. 1921	14,058.33
Mar. " – Feb. "	14,433.33
Apr. " – Mar. "	14,875.00
May " – Apr. "	15,375.00
June " – May "	16,000.00
July " – June "	16,500.00
Aug. " – July "	17,041.67
Sept. " – Aug. "	17,500.00
Oct. " – Sept. "	18,083.33
Nov " – Oct. "	18,916.67
Dec. " – Nov. "	19,791.67
Jan. " – Dec. "	20,791.67

When the moving average is employed, the effects of seasonal variations are avoided and the underlying tendencies are brought out.

PROGRESSIVE AVERAGE ILLUSTRATED.—The following table shows the progressive average for the data given in the preceding illustration. The first average is for the first two months of 1920, and the following averages are secured by including an additional month each time.

	Progressive Average
Jan., 1920 – Feb. 1920	$11,750.00
" " – Mar. "	11,733.33
" " – Apr. "	11,800.00
" " – May "	11,640.00
" " – June "	11,866.67
" " – July "	11,957.14
" " – Aug. "	12,212.50
" " – Sept. "	12,522.22
" " – Oct. "	12,870.00
" " – Nov. "	13,200.00
" " – Dec. "	13,600.00
" " – Jan. 1921	13,900.00
" " – Feb. "	14,050.00
" " – Mar. "	14,246.67
" " – Apr. "	14,481.25
" " – May "	14,717.65
" " – June "	14,955.56
" " – July "	15,168.42
" " – Aug. "	15,385.00
" " – Sept. "	15,700.00
" " – Oct. "	16,254.55
" " – Nov. "	16,639.13
" " – Dec. "	17,195.83

Average Applied to Accounts

THE AVERAGE DATE.—The purpose of averaging an account is to determine a date on which an account consisting of two or more items can be settled equitably to both parties concerned. It is sometimes desirable to compute the average date for the purpose of determining the date of maturity of a note given in settlement of an account. It is also sometimes used to compute interest on the balance instead of on the separate items of an account.

AVERAGE DATE ILLUSTRATED.—On Mar. 1, A buys from B, merchandise on account, 60 days, $500; on Mar. 31, he again buys merchandise on account, 60 days, $500. The first item is due Apr. 30, and the second May 30. Each item may be paid at maturity, or the total, $1,000, may be paid at the average due date, which is May 15. This date might be made the due date for a single note covering both items, due May 15, instead of two notes due respectively, on July 31 and Aug. 29.

If A should settle this account on June 16 by a single payment of $1,000, he would pay interest at say 6% as follows:

On $500, Apr. 30–June 16, 47 days	$3.91
" $500, May 30–June 16, 17 "	1.42
	$5.33

The interest may be computed on the balance of $1,000 for the time between average due date, May 15, and June 16, 32 days, which also gives $5.33 as a result.

If the amounts differ, they must be taken into consideration. If the amounts in the above illustration are changed to stand as follows: Mar. 1, A buys from B, merchandise on account, 60 days, $1,000; on Mar. 31, 60 days, $500; then the $1,000 item is due Apr. 30, and the $500 item May 30. Average due date would be May 10 because the $1,000 paid 10 days before maturity offsets the $500 paid 20 days after maturity.

When accounts become more complicated, it is necessary to employ the principle of the weighted average and to select a basic or focal date for calculating time. The last day of the month preceding the earliest date used in averaging should be used for this purpose. Take the following account:

Date of Transaction	Term of Payment	Date Used in Averaging	Amount
Mar. 1	60 days	Apr. 30	$1,000
" 31	60 "	May 30	500

Since the first date used in averaging is Apr. 30, the last day of the preceding month, Mar. 31, is the focal date to select. The following steps should next be taken:

1. Assume payment of each item on the focal date.
2. Determine how many days each item would be prepaid if paid on focal date.
3. Multiply its amount by this number.
4. Add results so obtained.
5. Divide the sum thus secured by the total of the items.

The quotient is the number of days the average date is preceded by the focal date.

These rules are applied to the account given above as follows:

1. Assume payment of both items on Mar. 31, the focal date.
2. Consequently, the first item is assumed to be prepaid 30 days; the second, 60 days.
3. Paying $1,000, 30 days before due, is equivalent to paying $1, 30,000 (1,000 × 30) days before it is due; and paying $500, 60 days before it is due, is equivalent to paying $1,30,000 (500 × 60) days before it is due.
4. The assumed prepayments are equivalent to the prepayment of $1, 60,000 days.
5. One dollar prepaid 60,000 days is equivalent to $1,500 prepaid 1/1,500 of 60,000, or 40 days. The average date is therefore 40 days after Mar. 31, or May 10.

When more than 1 month intervenes between the focal date and the date of any item in the account, the reduction of months to days may be avoided by the following method:

1. State time in months and days.
2. Multiply amount of each item by the number of months to obtain a product of months; and by number of days to obtain a product of days.
3. Add products of months, also products of days.
4. Reduce sum of products of months to days by multiplying by 30.
5. To this product add the product of days previously determined.
6. Divide this total by the balance of the account to find time in days between focal and average dates.
7. Reduce this to months and days on basis of 30 days to a month.

COMPOUND AVERAGE.—When both debit and credit items are included in an account, the average date is found by compound average. The steps necessary are as follows:

1. Determine products of months and days for both debits and credits.
2. Determine difference between sum of debit products and sum of credit products.
3. Divide this difference by balance of the account.
4. If difference of the products is on same side of the account as its balance, average date is forward from focal date; if difference is on opposite side, average date is backward from focal date.

Compound Average Illustrated.—Assume the following account:

Debits		Credits	
June 15	$400	July 3 Cash	$300
" 25, 1 mo.	200	" 20 "	600
July 10	800		
" 28	100		
Aug. 5	200		

The most convenient focal date is May 31. The sum of the products of months and days for the debit items of the account are found thus:

Date of Transaction	Terms of Payment	Date in Average	Time Mos.	Time Days	Amount	Products Mos.	Products Days
June 15	....	June 15	0	15	$ 400	$ 0	$ 6,000
" 25	1 mo.	July 25	1	25	200	200	5,000
July 10	....	" 10	1	10	800	800	8,000
" 28	....	" 28	1	28	100	100	2,800
Aug. 5	....	Aug. 5	2	5	200	400	1,000
	Total debits				$1,700	$1,500	$22,800
						30 × $1,500 =	45,000
	Total debit products						$67,800

The sum of products of months and days for the credit items of the account is found thus:

Date of Transaction	Terms of Payment	Date in Average	Time Mos.	Time Days	Amount	Products Mos.	Products Days
July 3	Cash	July 3	1	3	$300	$300	$ 900
" 20	"	" 20	1	20	600	600	12,000
	Total credits				$900	$900	$12,900
					30 ×	$900 =	27,000
	Total credit products						$39,900

The account balance is a debit of $800, and the sum of the debit products exceeds the sum of the credit products by 27,900. The average date is forward from May 31, the focal date, as many days as 27,900 divided by 800, or approximately 35. July 5 is, therefore, the focal date.

THE EQUATED DATE.—The equated date is that at which the balance of an account is at a minimum. The account may have only debits, only credits, or both debits and credits. Some date is assumed as a balancing date. Usually either the earliest or the latest date in the problem is assumed. This is called the focal date. The account is balanced as of this date, and then we determine how may days out of the way this focal date is; and reckon backward or forward to the equated date.

Equated Date Illustrated—One-sided Account.—Determine the equated date of the following account at 6%, bankers' time:

Debits: July 13, $800; July 25, $400; Aug. 3, $175. The latest date is Aug. 3, which is the focal date.

Amount	Due	Time	Interest
$ 800	July 13	21 days	$2.80
400	" 25	9 "	.60
175	Aug. 3	0 "	.....
$1,375			$3.40

Since all items are debits, the balance is $1,375, and this is accruing interest at the rate of 23 cents a day. It has already accrued $3.40; therefore, interest has been accruing (3.40 ÷ .23), approximately 15 days. Figuring backwards, 15 days from Aug. 3, gives July 19 as the equated date. The result may be proved by balancing the account as of July 19, as follows:

Interest to July 19:		
$800 for 6 days		$0.80
Interest from July 19:		
$400 for 6 days	$0.40	
$175 for 15 days	0.40	$0.80

Valuation

VALUATION OF WASTING ASSETS.—Valuation as applied to wasting assets may refer either to a single unit or it may refer to various combinations of units of physical plant. Provision is made for the replacement of physical units of plant on the basis of their estimated life. If funds are to be accumulated on the basis of replacement cost rather than that of original cost, the amount to be accumulated may be either larger or smaller than original cost, depending on the trend of prices. Allowance must also be made for scrap value. Cost less scrap value is known as wearing value. This wearing value is the amount that must be accumulated if original cost is to be provided for in the provision for depreciation.

If the replacement fund is permitted to accumulate by compound interest, the equal annual instalments to this fund are determined by the following formula:

$$x = V\left(\frac{r-1}{r^n-1}\right)$$

in which V is the fund to be accumulated, r is the ratio of increase, and n is the number of years during which the fund is to accumulate.

Thus, if an asset cost $1,000, has an estimated life of 5 years, and an estimated scrap value of $50, and the fund is to accumulate at $3\frac{1}{2}\%$, the annual instalment is:

$$x = 950\left(\frac{1.035 - 1}{1.035^5 - 1}\right)$$
$$= \$177.157$$

A schedule showing the accumulation of the fund is given below:

Year	Yearly Payment	Interest on Fund	Yearly Addition	Total in Fund
1	$177.157		$177.157	$177.157
2	177.157	$ 6.201	183.358	360.515
3	177.157	12.618	189.775	550.291
4	177.157	19.260	196.418	746.708
5	177.157	26.135	203.292	950.000
	$885.785	$64.214	$950.000	

Theoretically, the amount in the fund shown in the last column is the measure of existing depreciation. This is, however, merely an assumption and the value of the assets in question should be checked up by any other available means.

VALUATION OF COMPOSITE PLANT.—When it is desired to ascertain a theoretical valuation of a plant as a whole, the depreciation must be figured on the various units of which the plant is composed. Thus, if a plant is composed of the following units having life and wearing value (cost less salvage) as shown below:

Unit	Life	Wearing Value	Yearly Charge
Building............	50	$40,000	$ 191.20
Engine..............	25	25,000	523.81
Boiler..............	20	10,000	302.43
Dynamo............	15	5,000	231.71
		$80,000	$1,249.15

then the yearly annual charge, on a 5% basis, is as shown in the last column. The rate of depreciation is the ratio of the yearly charge to the total wearing value, or $1,249.15 \div 80,000 = 1.5614\%$. This is low here because over long periods the interest item is a large factor.

The time required for the yearly additions to the depreciation fund to accumulate to the original wearing value of the plant is known as the composite life of the plant.

In the example above, $1,249.15 a year must accumulate a wearing value of $80,000. That is,

$$1,249.15 \times \frac{1.05^n - 1}{.05} = 80,000$$

Dividing both sides by 80,000, we have

$$\frac{1,249.15}{80,000} \times \frac{1.05^n - 1}{.05} = 1$$

But 1,249.15 ÷ 80,000 is d, the depreciation rate. We have, therefore,

$$d \times \frac{1.05^n - 1}{.05} = 1$$

$$\text{or, } 1.05^n - 1 = \frac{.05}{d}$$

Transposing 1 to right,

$$1.05^n = 1 + \frac{.05}{d}$$

Applying logs to both sides,

$$n \log 1.05 = \log\left(1 + \frac{.05}{d}\right)$$

$$\text{or,} \qquad n = \frac{\log\left(1 + \frac{.05}{d}\right)}{\log 1.05}$$

Rule.—To find the composite life, divide i by the rate of depreciation, add 1 and find the log; divide by the log of $(1 + i)$.

For the above problem $\frac{i}{d} = 3.202$

add 1 and find log .62346
log of 1 + .05 or 1.05 = .02119
.62346 ÷ .02119 = 29.4 years

The composite life of a plant should be known when bonds secured by a mortgage on plant and equipment are issued. Such bonds should not be issued for a term of years which exceeds the composite life of the plant. To provide a margin of safety the term of the bonds should be considerably shorter than the plant's composite life.

VALUATION OF MINES, TIMBER LANDS, ETC.—In case of permanent assets the value is determined by dividing the income by the income rate desired, expressed thus:

$$\text{Value} = \frac{R}{i}, \; R \text{ being the annual income}$$

When the asset possesses limited life provision must be made against the time when the rent or income will cease. This takes the form of a sinking fund payment, which may be regarded as an additional rate to be added to i and is expressed as i'. The formula then becomes:

$$\text{Value} = \frac{R}{\frac{1}{S_n}(\text{at rate } i') + i}$$

Rule.—To find the value of a mine, add the sinking fund charge at rate i' to the rate of interest i; divide the result into the periodic rent.

Valuation of Mines Illustrated.—A mine will produce a net income of \$25,000 a year for 40 years. Determine its value if the annual dividend rate is to be 7% payable annually and the sinking fund is to accumulate at 4%, interest annually.

$$\frac{1}{S}, \text{ 40 yr. at } 4\% = .01052349$$

$$i = .07$$

$$.01052349 + .07 = .08052349$$

$$25,000 \div .08052349 = \$310,468.41$$

CAPITALIZATION OF ASSETS.—It is sometimes desirable to find what sum of money is necessary to construct a building and keep it in repair for its estimated life. The cost of a perpetuity of 1 per annum is $\frac{1}{i}$ and the income from a sinking fund is $\frac{1}{S_n}$, where S_n is the amount of an ordinary annuity. The product of these is the cost of a series of yearly items representing upkeep and repairs.

Capitalization of Assets Illustrated.—What amount must be given to a hospital to enable it to construct a building having an original cost of $100,000, an estimated life of 60 years, and an estimated annual upkeep cost of $10,000, and enable the hospital to have on hand at the end of 60 years $100,000 to replace the building? Money returns 4%.

First cost	= $100,000.00
Renewals $100{,}000 \times \frac{1}{.04} \times .00424432$	= 10,610.80
Upkeep $\frac{10{,}000}{.04}$	= 250,000.00
Answer	= $360,618.80

The formula for the above is developed as follows:

Let $C\infty$ = the capitalized cost of the asset.
C = cost of building new.
n = life in years.
R = annual repair charge.
i = interest rate.
$\frac{R}{i}$ = annual repair charge capitalized.
$\frac{C}{i} \times \frac{1}{S_n}$ = renewal charges capitalized.

$$C\infty = C + \frac{C}{i} \times \frac{1}{S_n} + \frac{R}{i}$$

In the above illustration,

$$= 100{,}000 + \frac{100{,}000}{.04} \times .00424432 + \frac{10{,}000}{.04}$$

VALUATION OF BONDS.—The value of a bond is the sum of the present worths of the principal and coupons at compound interest for the period for which they respectively have to run, assuming a given rate of income on the money invested therein. If the purchaser buys at a price below this value, he will receive a higher rate of income than he anticipated. If he pays more, his return will be less than he anticipated.

There are two important fixed points in the history of a bond—the original investment and the par value or amount received by the owner at maturity. There occurs a gradual change between these two points. If the bond is purchased below par, the value rises to par. If the bond is purchased above par, the value falls to par. This change in value is the effect of two opposing forces, namely, the interest earned, which tends to increase the value, and the redemption of coupons, which tends to reduce it. The investment value of a bond can be computed at any time between date of issue and date of redemption. In accounting for investments the bonds should be entered at cost and should go out of the accounts at par, providing they are held until maturity. During the period between purchase and redemption there

should occur a gradual process of amortization or accumulation, according as the bond was purchased above or below par. The market value of a bond is of no significance from the accounting point of view.

NOMINAL AND EFFECTIVE INTEREST RATES.—The nominal or cash interest rate is the ratio of the dividend to the par value of the bond. The effective interest rate is the true income rate, which is a certain percentage of the amount originally invested or which remains invested at any given time. The former is sometimes known as the cash rate, the latter as the income rate.

BOND VALUATION—FIRST METHOD.—If a bond is purchased above or below par, the following elements must be considered in valuing it: (a) the par value; (b) the number of periods the bond has to run, designated by n; (c) an annuity of c per cent of par for n periods; (d) the ratio of increase, $1 + i$.

Illustration.—A bond bears a nominal rate of 6%, payable semiannually, runs 40 years (80 periods), and has a par of \$1,000. Required, to compute its value at the beginning of its first interest period.

This value consists of two parts: (1) the present worth of \$1,000 due 80 periods hence; and (2) the present worth of an annuity of \$30 for 80 periods. It is assumed that securities of this grade net 3% per period. This is ordinarily termed a 6% basis. The ratio of increase per period is 1.03.

First, find the present worth of the principal sum, \$1,000, due 80 periods hence at 3% per period. The present worth of \$1 due in 80 periods at 3% is \$0.0939771 (see table, p. 139); therefore, the present worth of \$1,000 due in 80 periods at 3% is 1,000 × \$0.0939771, or \$93.9771.

Next, find the present value of an annuity of \$30 for 80 periods at 3%. The present value of an annuity of \$1 for the same number of periods and the same rate is \$30.20076345. Therefore, the present value of an annuity of \$30 for the same number of periods and the same rate is 30 × \$30.20076345, or \$906.0229.

The two elements which constitute the value of the bond and their total are shown below:

Present worth of par due in 80 periods	\$ 93.9771
Present worth of coupons	906.0229
	\$1,000.0000

The result happens to be \$1,000 or par because the yield assumed is the same as the nominal rate. If we assume the yield to be $2\frac{1}{2}$% on bonds of this type each period, the result is as follows:

Present value of coupons	\$1,033.5545
Present worth of par due in 80 periods	138.7046
Value of bond	\$1,172.2591

BOND VALUATION—SECOND METHOD.—Assuming the same data as was used in the second illustration of the first method, each periodic payment of \$30 may be regarded as being composed of two parts, \$25 representing the income on the \$1,000 par value at the assumed rate of $2\frac{1}{2}$%, and \$5, which is an annuity over and above the income rate and the present worth of which is the premium that must be paid on the bond. The present value of an annuity of \$1 for 80 periods at $2\frac{1}{2}$% is \$34.45181722. The present value of an annuity of \$5 for the same number of periods and at the same rate

is $5 \times 34.45181722 = \$172.259086$. This added to the principal, \$1,000, gives \$1,172.26 as the present worth of the bond. This method is somewhat quicker than the first method.

BOND VALUATION—BOND SOLD BELOW PAR.—If the cash rate is less than the nominal rate, the value of the annuity should be subtracted from the par of the bond. Thus in the preceding illustration, if the nominal rate is changed to 3% and the cash rate to $2\frac{1}{2}$%, or \$25 per period, the present value of the annuity of \$5 for 80 periods at $2\frac{1}{2}$%, which is \$172.26, must be subtracted from par, \$1,000, which gives \$827.74 as the present value of the bond.

BOND AMORTIZATION AND ACCUMULATION.—A \$1,000 bond running 80 periods and bearing a nominal rate of 3% per period, but bought to yield $2\frac{1}{2}$%, is worth \$1,172.26. At the end of the first half-year or period the holder receives as true income $2\frac{1}{2}$% on \$1,172.26, or \$29.31. He collects, however, \$30, or 3% of \$1,000. Deducting the income, \$29.31, from the amount received, leaves \$0.69, which should be applied to amortize the premium. This leaves the value of the bond at the end of the first half-year $\$1{,}172.26-\$0.69 = \$1{,}171.57$. In this way the principal sum is reduced each period until at maturity it is just equal to par.

For accounting purposes it is desirable to construct a schedule of amortization which shows the extinction or amortization of the premium by the subtraction therefrom of the surplus interest. To illustrate, assume that a \$1,000 bond dated Jan. 1, 1920, having 2 years to run, and paying 3% semi-annually on par, is bought to yield an income of $2\frac{1}{2}$% semi-annually. The present worth of an annuity of \$1 for 4 periods at $2\frac{1}{2}$% is \$3.76197421; therefore, the present worth of an annuity of \$5 for the same number of periods and at the same rate of interest is $5 \times \$3.76197421 = \$18.809871$. The cost of the bond is $\$1{,}000 + \$18.81 = \$1{,}018.81$. A schedule of amortization for this bond is shown below:

Date	Interest Received 3%	True Income $2\frac{1}{2}$%	Amortization	Book Value	Par
Jan. 1, 1920				\$1,018.81	\$1,000.00
July 1, "	\$ 30.00	\$ 25.47	\$ 4.53	1,014.28	
Jan. 1, 1921	30.00	25.36	4.64	1,009.64	
July 1, "	30.00	25.24	4.76	1,004.88	
Jan. 1, 1922	30.00	25.12	4.88	1,000.00	
	\$120.00	\$101.19	\$18.81		

In practice the schedule will ordinarily be longer because of the longer terms of most bonds. Such a schedule is necessary for the proper accounting treatment of bonds. From this we determine the amount to "write off" the premium each half-year in order to reduce the book value to par at maturity. Thus, the entry as at July 1, 1920, is as follows:

Cash	\$30.00	
Bond		\$ 4.53
Income on Bond		25.47

and a similar entry is required at each interest date.

If the bond is purchased at a discount, the schedule is one of accumulation. Assume that a $1,000 bond, dated Jan. 1, 1920, having 2 years to run, and paying $2\frac{1}{2}\%$ semiannually, is bought to yield an income of 3% semiannually.

The present worth of an annuity of $1 for 4 periods at 3% is $3.7170984; therefore, the present worth of an annuity of $5 for the same number of periods and at the same rate of interest is $5 \times \$3.7170984 = \$18.585492$. The cost of the bond is $1,000 − $18.59 = $981.41. A schedule of accumulation for this bond is shown below.

Date	Interest Received $2\frac{1}{2}\%$	True Income 3%	Accumulation	Book Value	Par
Jan. 1, 1920				$981.41	$1,000.00
July 1, "	$ 25.00	$ 29.44	$ 4.44	985.85	
Jan. 1, 1921	25.00	29.58	4.58	990.43	
July 1, "	25.00	29.71	4.71	995.14	
Jan. 1, 1922	25.00	29.85	4.85	999.99	
	$100.00	$118.58	$18.58		

In the amortization schedule the total of the true income and amortization columns equals the total of the interest received column.

In the accumulation schedule the total of the true income column minus the total of the accumulation column equals the total of the interest received column.

The figures in the book value column correspond to the figures found in tables of bond values which are published in book form. Given the figures in this column or in the bond tables, the other figures can be derived by addition or subtraction. The amortization or the accumulation would be the difference between successive book values. The net income for any period would be found either by adding the accumulation to the total interest or by deducting the amortization from the total interest.

BONDS PURCHASED AT INTERMEDIATE DATES.—Ordinarily bonds are purchased between interest dates. It is then necessary to make certain adjustments in order to determine the price of the bond.

Rule.—Determine the price which would have been paid had the bond been purchased at the last preceding interest date; also that which would have to be paid at the next succeeding interest date. The difference between these prices is the premium or discount which would be amortized over the entire period between these two dates. Multiply this difference by the fraction of the period which precedes the date of purchase. The product is the premium or discount for this fractional period. If a premium, deduct it from the price at the last preceding interest date. If a discount, add it to this price. To the result add the accrued interest on the par value of the bond.

Illustration.—What should be paid for a $1,000 bond due in 4 years, 1 month, bearing 6% interest, and bought to net 4%?

Value 9 periods to maturity	$1,081.62
" 8 " " "	1,073.24
Premium amortized in 6 months	$ 8.38

Multiply by 5/6 fraction of period expired	5/6
Premium amortized in 5 months	$ 7.00
Price $4\frac{1}{2}$ years to maturity	$1,081.62
Deduct premium for 5 months	7.00
Value 4 years, 1 month before maturity (and int. price)	$1,074.62
Add interest for 5 months on $1,000 at 6%	25.00
Price including interest (flat price)	$1,099.62

What should be paid for a $1,000 bond due in 4 years, 1 month, bearing interest at 4%, and bought to yield 6%?

Value 8 periods to maturity	$929.80
" " " " "	922.14
Discount amortized in 6 months	$ 7.66
Multiply by 5/6 fraction of period expired	5/6
Discount amortized in 5 months	$ 6.35
Add value $4\frac{1}{2}$ years to maturity	922.14
	$928.49
Add accrued interest at 4% on $1,000 for 5 months	16.67
Price including interest	$945.16

BOND SUBJECT TO OPTIONAL REDEMPTION.—When bonds are subject to optional redemption by the debtor, this fact must be considered in determining what price to pay in order to secure a given return, if the bonds are bought at either a discount or a premium.

If the bonds are bought at a premium and the debtor has the right to redeem at par before maturity, the price paid should be based on the assumption that the right will be exercised. If the bonds are bought at a discount and are subject to redemption at par, it should be assumed that the right of redemption will not be exercised. If the bonds are bought at a discount and are subject to redemption before maturity at a premium, it should be assumed that the right of redemption will not be exercised. If the bonds are bought at a premium and are subject to redemption before maturity at a premium, it cannot be assumed that redemption will or will not be exercised. In this case the buyer should figure the price on two bases: (1) assuming that the bonds will run to maturity, and (2) assuming that the option to redeem will be exercised. He should pay the lower of the two prices.

Illustration.—A bond buyer desires to purchase a $1,000, 5% bond, due in 30 years, with the privilege of redemption in 20 years, at 115, in order to yield 4% on his investment.

If the option is exercised the value is computed as follows:

The present value of $1,150 due in 20 yr. at 4%, is $1,150 × .45638695 (present worth of $1, in 20 yr.)	$ 524.84

The value of the coupons is found thus:

Present value of 1 at 2% for 40 periods is .... .45289042
The compound discount is .... .54710958
.54710958 ÷ .02 = 27.355479 present value of an annuity of 1.

25×27.355479	683.89
Price, if option is exercised	\$1,208.73

If the bond runs to maturity, the value is computed as follows:

The present value of \$1,000 due in 30 yr. to yield 4%, is \$1,000 × .30831867 (present worth of \$1 in 30 yr.)	\$ 308.32
The value of the coupons is found thus:	
Present value of 1 at 2% for 60 periods is .30478227	
The compound discount is .69521773	
$.69521773 \div .02 = 34.760886$ present value of an annuity of 1.	
30×34.760886	1,042.83
Price, if bond runs to maturity	\$1,351.15

The buyer should assume that the option will be exercised and pay \$1,208.73.

LIFE-TENANT AND REMAINDERMAN.—When bonds are held in trust, they should be amortized unless there are testamentary instructions to the contrary. If a trustee invests \$54,217.50 in a 5% bond having 10 years to run, and pays the full amount of the coupons, as they fall due, to the life-tenant, the fund at the end of 10 years will amount to only \$50,000. The investment is on a 4% basis. The trustee should pay over to the life-tenant at the end of the first half-year 2% of \$54,217.50, or \$1,084.35; not 2½% of \$50,000, or \$1,250. Since the trustee receives \$1,250, he has to reinvest the difference between this and \$1,084.35, or \$165.65.

At the end of the next interest period the bond yields a net income of \$1,081.03. The life-tenant also receives the interest on \$165.65. If this has been invested at 4%, this interest amounts to \$3.31. The total amount due to the life-tenant is \$1,081.03 + \$3.31 = \$1,084.34. This is \$0.01 less than the income the first half-year. The difference between this \$1,084.34 and the coupons received is \$165.66, which is the amount to be amortized at the end of the second half-year. It must also be reinvested. The trustee's fund then stands thus:

Book value of bonds	\$53,886.19
Invested end of first half-year	165.65
Invested end of second half-year	165.66
Total in fund end of first year	\$54,217.50

The Appellate Division of the New York Supreme Court (38 App. Div. 419) has emphasized the fact that it is the trustee's duty to reserve the proper amount of interest to amortize the premium. In this decision the court said, in part:

"If one buys a ten-year five per cent bond at one hundred and twenty, the true income or interest the bond pays is not 4 1/6% on the amount invested, nor 5% on the face of the bond, but 2 7/10% on the investment, or 3 24/100% on the face of the bond. The matter is simply one of arithmetical calculation, and tables are readily accessible, showing the result of the computation."

BOND TABLES.—Bond tables show the value of bonds at various coupon rates, for various yields of net income, and for various periods of time to run. Bond tables usually are constructed for bonds whose coupons are payable semiannually. Usually values are found in supplementary tables for bonds whose coupons are payable quarterly or yearly. The following table, given here for illustrative purposes, is taken from Sprague's "Extended Bond Tables" (p. 80):

Values, to the nearest Cent, of a Bond for $1,000,000 at 5% Interest, payable semiannually

Net Income	3 Years	3½ Years	4 Years	4½ Years	5 Years
2 50	1 071 825 12	1 083 284 07	1 084 601 55	1 105 779 31	1 116 819 07
2 55	1 070 328 46	1 081 538 84	1 092 608 09	1 103 537 98	1 114 330 27

Practical Measurements and Tables

Linear Measure

Linear measures are employed in measuring distance and length.

12 inches (in.)	= 1 foot (ft.)
3 feet	= 1 yard (yd.)
$5\frac{1}{2}$ yards, or $16\frac{1}{2}$ feet	= 1 rod (rd.)
320 rods, or 5,280 feet	= 1 mile (mi.)

Sometimes the signs (′) and (″) are used in place of ft. and in., contractions for feet and inches. Thus, 3′ 4″ instead of 3 ft. 4 in.

Square Measure

Square measure is used in measuring surfaces.

144 square inches (sq. in.)	= 1 square foot (sq. ft.)
9 square feet	= 1 square yard (sq. yd.)
$30\frac{1}{4}$ square yards	= 1 square rod (sq. rd.)
160 square rods	= 1 acre (A)
640 acres	= 1 square mile (sq. mi.)
1 acre = 4,840 sq. yds.	= 43,560 sq. ft.

Cubic Measure

Cubic measure is used in measuring volumes.

1,728 cubic inches (cu. in.)	= 1 cubic foot (cu. ft.)
27 cubic feet	= 1 cubic yard (cu. yd.)
128 cubic feet	= 1 cord (cd.)

Dry Measure

2 pints (pt.)	= 1 quart (qt.)
8 quarts	= 1 peck (pk.)
4 pecks	= 1 bushel (bu.)

Liquid Measure

2 pints	= 1 quart
4 quarts	= 1 gallon
63 gallons	= 1 hogshead (hhd.)

A standard bushel contains 2,150.42 cubic inches.
A heaped bushel contains 2,747.715 cubic inches.

Avoirdupois Weight

16 ounces (oz.)	= 1 pound (lb.)
2,000 pounds	= 1 ton (T.)

Grain and Seeds

The number of pounds in a bushel of the following commodities are given below as used in most states of the United States. These weights are not, however, uniform in all states.

Corn (shelled)	56 lb.
Corn on cob	70 "
Corn (in husk or shuck)	72 "
Wheat	60 "
Oats	32 "
Rye	56 "
Barley	48 "
Flaxseed	56 lb.
Cloverseed	60 "
Beans	60 "
Bran	20 "
Peas	60 "
Timothy seed	45 "
Corn meal	48 "
Potatoes	60 "

Values of Foreign Coins

Country	Legal standard	Monetary unit	Value in terms of U. S. money	Remarks
Argentine Republic	Gold	Peso	$0.9648	Currency: Paper, normally convertible at 44 per cent of face value; now inconvertible.
Austria	Gold	Krone	.2026	
Belgium	Gold and silver	Franc	.1930	Member Latin Union; gold is actual standard.
Bolivia	Gold	Boliviano	.3893	12½ bolivianos equal 1 pound sterling.
Brazil	Gold	Milreis	.5462	Currency: Government paper normally convertible at 16 pence (=$0.3244) per milreis.
British Cols. in Australasia and Africa.	Gold	Pound sterling	4.8665	
British Honduras	Gold	Dollar	1.0000	
Bulgaria	Gold	Lev	.1930	
Canada	Gold	Dollar	1.0000	
Chile	Gold	Peso	.3650	Currency: Inconvertible paper.
China	Silver	Tael: Amoy	.8318	
		Canton	.8293	
		Cheefoo	.7955	
		Chin Kiang	.8125	
		Fuchau	.7694	
		Haikwan (customs)	.8463	The tael is a unit of weight; not a coin. The customs unit is the Haikwan tael. The values of other taels are based on their relation to the value of the Haikwan tael.
		Hankow	.7782	
		Kiaochow	.8060	
		Nankin	.8237	
		Niuchwang	.7800	The Yuan silver dollar of 100 cents is the monetary unit of the Chinese Republic; it is equivalent to .644+ of the Haikwan tael.
		Ningpo	.7997	
		Peking	.8109	
		Shanghai	.7598	
		Swatow	.7683	
		Takau	.8370	
		Tientsin	.8060	
		Dollar: Yuan	.5390	
		Hongkong	.5471	
		British	.5471	
		Mexican	.5511	Mexican silver pesos issued under Mexican decree of Nov. 13, 1918, are of silver content approximately 41% less than dollar here quoted; those issued under decree of Oct. 27, 1919, contain about 51% less silver.
Colombia	Gold	Peso	.9733	Currency: Government paper and gold.

Costa Rica	Gold	Colon	.4653	
Cuba	Gold	Peso	1.0000	
Denmark	Gold	Krone	.2680	
Ecuador	Gold	Sucre	.4867	
Egypt	Gold	Pound (100 piasters)	4.9431	British pound sterling is legal tender for 97½ piasters.
Finland	Gold	Markka	.1930	
France	Gold and silver	Franc	.1930	Member Latin Union; gold is actual standard.
Germany	Gold	Mark	.2382	
Great Britain	Gold	Pound sterling	4.8665	
Greece	Gold and silver	Drachma	.1930	Member Latin Union; gold is actual standard.
Guatemala	Silver	Peso	.5074	Currency: Inconvertible paper.
Haiti	Gold	Gourde	.2000	Currency: Inconvertible paper.
Honduras	Silver	Peso	.5074	Currency, bank notes.
India [British]	Gold	Mohur and sovereign	4.8665	The British sovereign and half sovereign are legal tender in India at 10 rupees per sovereign.
	Silver	Rupee	.2411	
Indo-China	Silver	Piaster	.5480	
Italy	Gold	Lira	.1930	Member Latin Union; gold is actual standard.
Japan	Gold	Yen	.4985	
Liberia	Gold	Dollar	1.0000	Currency: Depreciated silver token coins.
Mexico	Gold	Peso	.4985	
Netherlands	Gold	Guilder (florin)	.4020	
Newfoundland	Gold	Dollar	1.0000	
Nicaragua	Gold	Cordoba	1.0000	
Norway	Gold	Krone	.2680	
Panama	Gold	Balboa	1.0000	
Paraguay	Gold	Peso (Argentine)	.9648	Currency: Depreciated Paraguayan paper currency.
Persia	Silver	Kran	.0934	Currency: Silver circulating above its metallic value.
Peru	Gold	Libra	4.8665	
Philippine Islands	Gold	Peso	.5000	
Portugal	Gold	Escudo	1.0805	Currency: Inconvertible paper.
Rumania	Gold	Leu	.1930	
Russia	Gold	Ruble	.5146	
Salvador	Gold	Colon	.5000	
Santo Domingo	Gold	Dollar	1.0000	
Serbia	Gold	Dinar	.1930	
Siam	Gold	Tical	.3709	
Spain	Gold and silver	Peseta	.1930	Valuation is for gold peseta; currency is notes of the bank of Spain.
Straits Settlements	Gold	Dollar	.5678	
Sweden	Gold	Krona	.2680	
Switzerland	Gold	Franc	.1930	Member Latin Union; gold is actual standard.
Turkey	Gold	Piaster	.0440	(100 piasters equal to the Turkish £.)
Uruguay	Gold	Peso	1.0342	Currency: Inconvertible paper.
Venezuela	Gold	Bolivar	.1930	

Time

60 seconds (sec.)	= 1 minute (min.)
60 minutes	= 1 hour (hr.)
24 hours	= 1 day (da.)
365 days	= 1 common year (yr.)
366 days	= 1 leap year
100 years	= 1 century (cen.)

Days in the Months

1. January (Jan.)........31
2. February (Feb.)..28 or 29
3. March (Mar.).........31
4. April (Apr.)...........30
5. May..................31
6. June..................30
7. July..................31
8. August (Aug.)........31
9. September (Sept.).....30
10. October (Oct.).......31
11. November (Nov.).....30
12. December (Dec.)......31

Angles and Circles

60 seconds (″)	= 1 minute (′)
60 minutes	= 1 degree (°)
360 degrees	= 1 circumference

United States Money

10 mills	= 1 cent (c)
10 cents	= 1 dime
10 dimes	= 1 dollar ($)
10 dollars	= 1 eagle

Coins in use: copper, 1 cent; nickel, 5 cents; silver dime, quarter, half-dollar, and dollar; gold, $5, $10, and $20, or double eagle. The mill is not coined.

English Money

4 farthings (far.)	= 1 penny (*d.*)
12 pence	= 1 shilling (*s.*)
20 shillings	= 1 pound (£)
21 shillings	= 1 Guinea (*G.*)

Troy Weight

24 grains (gr.)	= 1 pennyweight (pwt.)
20 pennyweight	= 1 ounce (oz.)
12 ounces	= 1 pound (lb.)

Troy weight is used in weighing precious metals. The standard is the troy pound, containing 5,760 grains. The avoirdupois pound contains 7,000 grains. The amount of pure gold in an article is expressed in carats, 24 units being the standard. Eighteen carats means 18/24, or $\frac{3}{4}$, pure gold and 6/24, or $\frac{1}{4}$, alloy. In weighing diamonds the carat is $3\frac{1}{6}$ grains.

Apothecaries' Weight

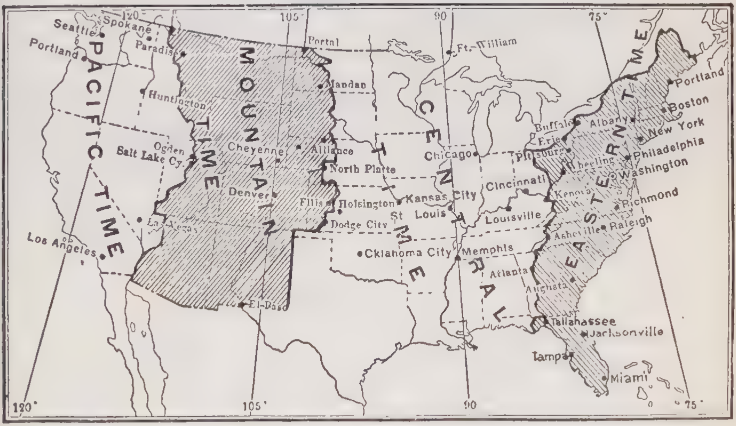
20 grains (gr.)	= 1 scruple (℈)
3 scruples	= 1 dram (ʒ)
8 drams	= 1 ounce (℥)
12 ounces	= 1 pound (lb.)

Relation between Longitude and Time

Time	Longitude	Longitude	Time
24 hr.	360°	360°	24 hr.
1 hr.	15°	1°	4 min.
1 min.	15′	1′	4 sec.
1 sec.	15″	1″	$\frac{1}{15}$ sec.

Standard Time

The earth's surface is divided into belts 15° wide, each being equal to 1 hour of time. The time in each belt is reckoned from a meridian extending about midway through the belt, so that the belt extends approximately $7\frac{1}{2}$° east and west of the meridian. In the United States and Canada the 75th, 90th, 105th, and 120th meridians have been adopted for this purpose, the four belts being the Eastern, Central, Mountain, and Pacific, as shown by the accompanying map.



Pacific Belt Mountain Belt Central Belt Eastern Belt

Standard Time in the United States

Counting

2 units	=1 pair (pr.)
6 units	=1 set, or half-doz.
12 units	=1 dozen
12 dozen	=1 gross
12 gross	=1 great gross
20 units	=1 score

Paper

24 sheets	=1 quire (qr.)
20 quires	=1 ream (rm.)
2 reams	=1 bundle (bdl.)
5 bundles	=1 bale (bl.)

Many paper mills, especially in the west, use 500 sheets to the ream, instead of 480.

Public Lands

In the older eastern sections of the United States no regular system of laying out public lands was adopted. According to a plan adopted later, a **base line** running east and west is surveyed, also a **principal meridian** cutting

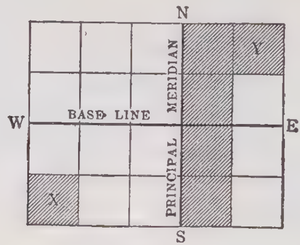


Fig. 1.

the base line at right angles. At intervals of 6 miles north and south of the base line and east and west of the principal meridian, lines parallel to these are drawn, forming areas 6 miles square. These are townships. A row of townships extending north and south is a **range.** These ranges are numbered east and west of the principal meridian, and north and south of the base

6	5	4	3	2	1
7	8	9	10	11	12
18	17	16	15	14	13
19	20	21	22	23	24
30	29	28	27	26	25
31	32	33	34	35	36

Fig. 2.

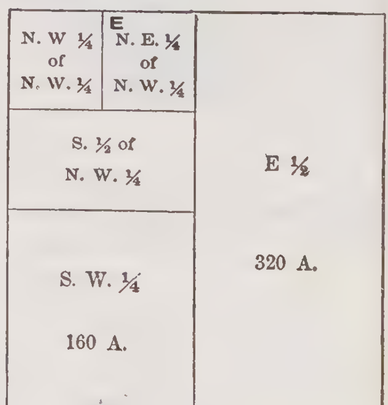

Fig. 3.

line. In Fig. 1, township X is designated T2S, R3W, or "Township 2 south, range 3 west." Township Y is T2N, R2E.

Each township contains 36 sections, each containing one square mile of area, or 640 acres. These sections are numbered as shown in Fig. 2.

Each section is divided into quarter sections, quarter sections into halves, fourths, etc., as shown in Fig. 3.

The Metric System

The metric system of weights and measures is based on the decimal system. It is in use in nearly all civilized countries. The United States and England are exceptions. It was officially adopted by the United States in 1866 but is as yet used only in scientific work. All units of measure and weight are based on the **meter,** which is the fundamental unit of the system. It is equal to one ten-millionth of the distance from the equator to the pole, or 39.37 in.

Linear Measure

10 millimeters (mm.)	= 1 centimeter (cm.)
10 centimeters	= 1 decimeter (dm.)
10 decimeters	= 1 **meter** (m.)
10 **meters**	= 1 decameter (Dm.)
10 decameters	= 1 hectometer (Hm.)
10 hectometers	= 1 kilometer (Km.)
10 kilometers	= 1 myriameter (Mm.)

Square Measure

100 square millimeters (sq. mm.)	= 1 square centimeter (sq. cm.)
100 square centimeters	= 1 square decimeter (sq. dm.)
100 square decimeters	= 1 **square meter** (sq. m.)
100 **square meters**	= 1 square decameter (sq. Dm.)
100 square decameters	= 1 square hectometer (sq. Hm.)
100 square hectometers	= 1 square kilometer (sq. Km.)

Land Measure

100 centares (ca.)	= 1 are (a.)	= 100 sq. m.
100 ares	= 1 hectare (Ha.)	= 10,000 sq. m.

Cubic Measure

1,000 cubic millimeters (cu. mm.)	= 1 cubic centimeter (cu. cm.)
1,000 cubic centimeters	= 1 cubic decimeter (cu. dm.)
1,000 cubic decimeters	= 1 cubic meter (cu. m.)

Wood Measure

10 decisteres (ds.)	= 1 stere (s.)	= 1 cu. m.
10 steres	= 1 decastere (Ds.)	= 10 cu. m.

Measure of Capacity

10 milliliters (ml.)	= 1 centiliter (cl.)
10 centiliters	= 1 deciliter (dl.)
10 deciliters	= 1 liter (l.)
10 liters	= 1 decaliter (Dl.)
10 decaliters	= 1 hectoliter (Hl.)
10 hectoliters	= 1 kiloliter (Kl.)

The liter is used for measuring liquids in ordinary quantities.
The centiliter or milliliter is used for measuring liquids in minute quantities
The hectoliter is used for measuring grain and vegetables.

Measure of Weight

10 milligrams (m.g.)	=1 centigram (cg.)
10 centigrams	=1 decigram (dg.)
10 decigrams	=1 gram (g.)
10 grams	=1 decagram (Dg.)
10 decagrams	=1 hectogram (Hg.)
10 hectograms	=1 kilogram (Kg.)
10 kilograms	=1 myriagram (Mg.)
10 myriagrams	=1 quintal (Q.)
10 quintals	=1 tonneau (T.)

The gram is the unit of weight. It is the weight of 1 cu. cm. of distilled water in a vacuum, at its greatest density (39.2°F.). It is equivalent to 15.4324 gr.

The gram is used to weigh drugs, letters, etc.

The kilogram is used to weigh merchandise; in large quantities the quintal and tonneau are used.

Tables of Equivalents

The following tables give equivalent values of both English and metric systems:

Linear Measure

1 inch	=2.54 centimeters	1 centimeter	=.3937 of an inch
1 foot	=.3048 of a meter	1 decimeter	=.328 of a foot
1 yard	=.9144 of a meter	1 meter	=1.0936 yards
1 rod	=5.029 meters	1 decameter	=1.9884 rods
1 mile	=1.6093 kilometers	1 kilometer	=.62137 of a mile

Surface Measure

1 sq. inch	=6.452 sq. centimeters	1 sq. centimeter	=.155 of a sq. inch
1 sq. foot	=.0929 of a sq. meter	1 sq. decimeter	=.1076 of a sq. foot
1 sq. yard	=.8361 of a sq. meter	1 sq. meter	=1.196 sq. yards
1 sq. rd.	=25.293 sq. meters	1 are	=3.954 sq. rods
1 acre	=40.47 ares	1 hectare	=2.471 acres
1 sq. mile	=259 hectares	1 sq. kilometer	=.3861 of a sq. mile

Cubic Measure

1 cu. inch	=16.387 cu. centimeters	1 cu. centimeter	=.061 of a cu. inch
1 cu. foot	=28.317 cu. decimeters	1 cu. decimeter	=.0353 of a cu. foot
1 cu. yard	=.7646 of a cu. meter	1 cu. meter	=1.308 cu. yards
1 cord	=3.624 steres	1 stere	=.2759 of a cord

Measures of Capacity

1 dry quart	=1.101 liters	1 liter	=.908 of a dry quart
1 liquid quart	=.9463 of a liter	1 liter	=1.0567 liquid qt.
1 liquid gallon	=.3785 of a decaliter	1 decaliter	=2.6417 liquid gal.
1 peck	=.881 of a decaliter	1 decaliter	=1.135 pecks
1 bushel	=.3524 of a hectoliter	1 hectoliter	=2.8377 bushels

Measures of Weight

1 grain, troy	=.0648 of a gram	1 gram	=15.432 grains, troy
1 ounce, troy	=31.104 grams	1 gram	=.03215 of an oz., troy
1 ounce, avoir.	=28.35 grams	1 gram	=.03527 of an oz., avoir.
1 lb., troy	=.3732 of a kilogram	1 kilogram	=2.679 lb., troy
1 lb., avoir.	=.4536 of a kilogram	1 kilogram	=2.2046 lb., avoir.
1 ton (short)	=.9072 of a tonneau or ton	1 tonneau	=1.1023 tons (short)

Convenient Equivalent Values

1 cu. cm. of water	=1 ml. of water, and weighs 1 gram	=15.432 gr.
1 cu. dm. of water	=1 l. of water, and weighs 1 Kg.	=2.2046 lb.
1 cu. m. of water	=1 Kl. of water, and weighs 1 tonneau	=2204.6 lb.

Mensuration

DEFINITION.—Mensuration treats of lines, surfaces, and solids and their measurements. Lines have one dimension—length. Surfaces have two dimensions—length and width. Solids have three dimensions—length, width, and thickness.

An **angle** is formed by two lines which meet.

A **right angle** is one formed by two lines which meet at an angle of 90 degrees.

A **polygon** is a plane surface bounded by straight lines.

A **quadrilateral** is a polygon bounded by four sides and having four angles.

A **parallelogram** is a quadrilateral whose opposite sides are parallel.

A **rectangle** is a parallelogram having right angles.

A **square** is a rectangle whose four sides are equal.

A **triangle** is a surface having three sides and three angles.

A **right-angled triangle** has one right angle. The side opposite the right angle is the **hypotenuse.**

An **isosceles triangle** has two of its sides equal.

An **equilateral triangle** has all sides and all angles equal.

A **circle** is a plane surface bounded by a curved line each point of which is equidistant with every other point thereof from an interior point known as the center. The bounding line is the **circumference.** The **diameter** is a straight line passing through the center and terminating at each end in the circumference. One-half the diameter is the **radius.**

The **perimeter** of a surface is the distance around it. Its **area** is the number of square units of area which it contains.

To find the area of a parallelogram: Multiply the base by the altitude.

To find the area of a triangle: Take one-half the product of the base and altitude.

To find the hypotenuse of a right triangle: Extract the square root of the sum of the squares of base and perpendicular.

To find base or perpendicular of a right-angle triangle: Extract the square root of the difference of the squares of the hypotenuse and the other given side.

To find the circumference of a circle: Multiply the diameter by 3.1416.

To find the diameter of a circle: Divide the circumference by 3.1416.

To find the area of a circle: Multiply the square of the diameter by .7854

Or, multiply the circumference by one-half the radius.

Or, multiply the square of the radius by 3.1416.

To find the diameter of a circle when the area is known: Divide the area by .7854 and extract the square root of the quotient.

To find the circumference of a circle when the area is known: Multiply the diameter by 3.1416. Find diameter from preceding rule.

A solid whose bases are equal polygons lying in parallel planes and whose sides are parallelograms is called a **prism.**

A prism having six equal square faces is a **cube.**

A solid whose bases are equal and parallel surfaces and whose surface is a uniform curve is a **cylinder.**

A **pyramid** is a solid whose base is a polygon and whose sides are triangles.

A **cone** is a solid whose base is a circle and whose surface tapers to a point.

To find the volume of a prism or cylinder: Multiply the area of the base by the altitude.

To find the surface of a right prism or cylinder: Multiply the perimeter of the base by the altitude. Add to the product the area of the bases.

To find the volume of a pyramid or cone: Take one-third of the product of the area of the base and the altitude.

To find the surface of a pyramid or cone: Multiply the perimeter of the base by one-half of the slant height. Add the area of the base.

The **areas** of similar surfaces are to each other as the squares of their like dimensions.

The **volumes** of similar solids are to each other as the cubes of their like dimensions.

To find the area of the surface of a sphere: equals the area of four great circles of the sphere. The area of a great circle is 3.1416 times the radius squared.

To find the volume of a sphere: Multiply the area of its surfaces by 1/3 of the radius.

Ratio and Proportion

DEFINITIONS.—Ratio of one quantity to a second similar quantity is the quotient obtained by dividing the first by the second. The colon (:) is the sign of ratio. Thus the ratio of 12 to 24 is expressed, 12 : 24. It is equivalent to $12 \div 24$, or $\frac{1}{2}$. The first term of a ratio is the **antecedent;** the second term is the **consequent.**

An equality of two ratios constitutes a **proportion.** The double colon (::) or (=) is the sign of proportion. Thus 12 : 24 :: 8 : 4 is read, 12 is to 24 as 8 is to 4. The extreme terms are the **extremes.** The second and third terms are the **means.** The first and third terms are the antecedents. The second and fourth terms are the consequents.

Progression

DEFINITIONS.—An **arithmetical progression** is a series of terms in which each succeeding term is obtained by adding a number, known as the **common difference,** to the preceding term. When the common difference is **positive,** the progression is **increasing.** When the common difference is **negative,** the progression is **decreasing.**

A **geometrical progression** is a series of terms in which each succeeding term is obtained by multiplying the preceding term by a constant amount, known as the **ratio.** When the ratio is greater than 1, the progression is ncreasing; when the ratio is less than 1, the progression is decreasing.

If the letters a, l, n, d, and s, denote respectively the first term, last term, number of terms, common difference, and sum of all the terms, then in an arithmetical progression,

$$(1) \qquad l = a + (n - 1)\,d$$

$$(2) \qquad s = \frac{n}{2}(a + l)$$

If the letters a, l, n, r, and s, denote respectively the first term, last term, number of terms, ratio, and sum of the terms of a geometrical progression,

$$(3) \qquad l = ar^{n-1}$$

$$(4) \qquad s = \frac{ar^n - a}{r - 1}$$

or

$$s = \frac{rl - a}{r - 1}$$

By means of formulas (1) and (2), any problem in arithmetical progression can be solved where any three of the quantities a, l, n, d, and s, are known.

By means of formulas (3) and (4), problems in geometrical progression can be solved. In some cases problems cannot be solved by these elementary processes. This is true when n is unknown, and usually when r is unknown.

Marking Goods

PROFIT BASED ON SELLING PRICE.—When goods are marked for resale, the percentage of profit may be added to cost, which consists of the invoice price plus freight and cartage, or it may be figured on sales. It is usually preferable to figure percentage of profit on sales, but this can be translated into a percentage on cost. The following table shows what percentage must be added to cost to arrive at a given percentage of profit on sales.

Profit Percentage Table

Add to Cost %	To Make on Selling Price %	Add to Cost %	To Make on Selling Price %
5	4¾	31.58	24
7½	7	33⅓	25
10.00	9	35.00	26
11.11	10	37½	27¼
12.36	11	40.00	28½
12½	11⅛	42.86	30
13.63	12	45.00	31
14.94	13	47.00	32
16.28	14	50.00	33⅓
16.43	14¼	53.85	35
17.65	15	55.00	35½
19.05	16	60.00	37½
20.00	16⅔	65.00	39½
20.49	17	66⅔	40
21.96	18	70.00	41
23.46	19	75.00	42¾
25.00	20	80.00	44½
26.58	21	85.00	46
28.21	22	90.00	47½
29.88	23	100.00	50

Illustration of Methods of Figuring Profit on Sales.—A merchant purchases a commodity for $1. His operating expenses are 20% of gross sales. He desires to make a net profit of 8%. What should be the selling price of the commodity?

Solution:

$$100 - (20 + 8) = 72\%$$
$$\$1 \div .72 = \$1.39 \textit{ answer}$$

Rule.—To the operating expense, add the net profit desired both expressed as percentage figures. Deduct this sum from 100%. Divide the cost of the article by the difference.

USE OF KEYS.—If both cost and selling prices are to be marked, use a separate key for each. The key may be any word or phrase containing ten letters, no two of which are alike. A repeater may be used when the same figure appears two or more times in succession in the price. This makes it more difficult for a customer to interpret the price.

Key to Cost Price.

E	S	R	O	H	K	C	A	L	B
1	2	3	4	5	6	7	8	9	0

Repeaters W and X

Key to Selling Price

N	O	T	S	E	L	R	A	H	C
1	2	3	4	5	6	7	8	9	0

Repeaters Y and Z

The words used are "black horse" and "Charleston" spelled backwards. Any letter other than those found in the key may be used as repeaters.

Illustration.—An article costs $5.27 and is to sell for $6.65. Placing the cost mark above and the selling price below, we have: $\frac{\text{H.SC}}{\text{L.ZE}}$.

Fire Insurance

DEFINITION.—**Insurance** is the agreement whereby, for a valuable consideration, one party agrees to indemnify another party for losses arising from specified causes.

The **premium** is the consideration paid by the party insured. It is expressed either as a per cent of the face of the policy or as a specified amount per $100.

The **term of insurance** is the length of time the policy of insurance runs, usually one or more years.

Fire insurance is the agreement to indemnify the insured against loss by fire.

The expression "loss by fire" means not only loss of property by actual contact with flames, but also loss resulting from water or chemicals used to extinquish the fire, also damages resulting from smoke. It includes losses from fire caused by lightning.

The "New York Standard (80%) Average Clause" provides, in part, that: "This company shall not be liable for a greater proportion of any loss or damage to the property described herein than the sum hereby insured bears to eighty per cent (80%) of the actual cash value of said property at the time such loss shall happen." The "Waiver Clause," also contained in the uniform policy adopted in Connecticut, New Jersey, New York, Pennsylvania, reads: "In case of loss if the value of the property described herein does not exceed $2,500, the 80% average or coinsurance clause shall be waived."

Under the **ordinary policy** the company pays any loss not in excess of the face of the policy.

Under a **valued policy** the value is specified; the company pays on the basis of this specified value.

Under the **open policy**, which is used to cover goods in storage, the amount of the policy varies as the quantity of goods is added to or decreased. These additions and withdrawals are recorded in an "Open Policy Book" kept by the company.

Fire insurance policies may be canceled by insurer or insured on 5 days' notice. If the insuring company cancels, it returns such portion of the premium as the unexpired term is of the whole term. If the insured cancels the policy, the company returns only the amount by which the premium paid exceeds the premium reckoned by the short rate, which is correspondingly higher for short periods of time. Following is the standard short-rate table used to compute premiums for terms less than 1 year, also to compute the amount of premium to be returned by the insurer when a policy is canceled by the insured.

Standard Short Rate Scale for Computing Premiums for Terms less than One Year, as adopted by the "Western Union"

Rule. Take the percentage indicated in scale opposite the number of days risk is to run, on the premium for one year at given rate, and the result will be the premium earned in case of cancellation, or to be charged in case of short risks.

1 day	2% annual premium		55 days		29% annual premium
2 days	4% " "		60 "		30% " "
3 "	5% " "		65 "		33% " "
4 "	6% " "		70 "		36% " "
5 "	7% " "		75 "		37% " "
6 "	8% " "		80 "		38% " "
7 "	9% " "		85 "		39% " "
8 "	9% " "		90 "	or 3 mo.	40% " "
9 "	10% " "		105 "		45% " "
10 "	10% " "		120 "	or 4 mo.	50% " "
11 "	11% " "		135 "		55% " "
12 "	12% " "		150 "	or 5 mo.	60% " "
13 "	13% " "		165 "		65% " "
14 "	13% " "		180 "	or 6 mo.	70% " "
15 "	14% " "		195 "		73% " "
16 "	14% " "		210 "	or 7 mo.	75% " "
17 "	15% " "		225 "		78% " "
18 "	16% " "		240 "	or 8 mo.	80% " "
19 "	16% " "		255 "		83% " "
20 "	17% " "		270 "	or 9 mo.	85% " "
25 "	19% " "		285 "		88% " "
30 "	20% " "		300 "	or 10 mo.	90% " "
35 "	23% " "		315 "		93% " "
40 "	26% " "		330 "	or 11 mo.	95% " "
45 "	27% " "		360 "	or 12 mo.	100% " "
50 "	28% " "				

Fire insurance problems require the application of principles of percentage. The value of the policy is the **base**. The rate of premium is the **rate**. The premium is the percentage.

TO FIND THE PREMIUM.—Divide the value of the policy by 100. Multiply the quotient by the rate.

Illustration.—Property is insured for $19,000 at a rate of 18 cents per $100 per annum. What is the annual premium?

$$\$19{,}000 \div 100 = 190$$
$$190 \times .18 = \$34.20 \quad \textit{answer}$$

TO FIND AMOUNT PAID BY INSURER.—Under an ordinary policy, the full amount of the loss up to the amount of the policy is paid.

Under a coinsurance policy, the portion of the loss paid is the ratio of the face of the policy to the value of the property.

Under the 80% average clause policy, that part of the loss is paid which is expressed by the ratio of the face of the policy to 80% of the value of the property.

Illustration.—Property having a value of $30,000 is insured for $20,000 at 3/8% per annum. Fire causes a loss of $15,000. Determine what would be paid by the insurer (1) under an ordinary policy, (2) under a coinsurance policy, (3) under the New York Standard (80%) Average Clause Policy.

(1) $15,000 under an ordinary policy.

(2) $$\frac{20{,}000}{30{,}000} = \frac{2}{3}$$

$\frac{2}{3}$ of $15,000 = $10,000 under a coinsurance policy.

(3) 80% of $30,000 = $24,000

$$\frac{20{,}000}{24{,}000} = \frac{5}{6}$$

$\frac{5}{6}$ of $15,000 = $12,500 under New York policy.

Domestic Exchange

DEFINITION.—Exchange consists in the payment of debts without the sending of money.

The following methods are employed:

1. Personal checks
2. Bank drafts
3. Postal money orders
4. Express money orders
5. Telegraphic money orders
6. Commercial drafts

Personal checks are a charge against the bank account of the maker and a credit to the bank account of the payee, when deposited. The checks issued by the maker are returned to his bank through the proper channels

Postal money order is an order issued by a post-office in one place against a post-office in some other place to pay a given sum to a designated person. The rates are:

For		$ 2.50 or less	$0.03	From	$30.01 to	$ 40	$0.15
From	2.51 to	$ 5.00	.05	"	40.01 "	50	.18
"	5.01 "	10.00	.08	"	50.01 "	60	.20
"	10.01 "	20.00	.10	"	60.01 "	75	.25
"	20.01 "	30.00	.12	"	75.01 "	100	.30

$100 is the largest amount for which a single postal money order is issued. In case of loss of postal money orders, duplicates can be secured from Washington, proper evidence being presented.

Express money orders are similar to postal money orders, being a written order by one express agent against another. $50 is the maximum amount of a single express money order. The same rates are charged as for postal money orders. They are transferable by indorsement.

Telegraphic money orders are useful when money must be sent quickly. The following table shows rates, the price including a 15-word message.

Table of Charges for Telegraph Money Orders*

For a Transfer of	To Any Place Where the 10-Word Telegram Rate Is							
	$.30	$.36	$.42	$.48	$.60	$.72	$.90	$1.20

2,800.01 to 2,900.00	8.28	8.34	8.40	8.51	8.63	8.82	9.05	9.48
2,900.01 to 3,000.00	8.53	8.59	8.65	8.76	8.88	9.07	9.30	9.73

$3,000.00 and up add $.20 for each additional $100 or fraction thereof to the charges for $3,000.

*A business or personal message may be included in the transfer at a small additional cost.

A **commercial draft** is an order drawn by a creditor against a debtor, ordering him to pay a sum of money to the drawer or a third person. Com-

mercial drafts are frequently used in connection with bills of lading, it being necessary for the consignee to make payment to the local bank to which the bill of lading with sight draft attached is sent (or to accept, if a time draft) in order to secure the bill of lading. Time drafts may be discounted by the holder.

The **maker** or **drawer** is the person who signs the draft.

The **payee** is the person to whom the amount specified in the draft is to be paid.

The **drawee** is the person who is to pay the draft.

Par is the face value.

Premium is the excess above face value paid for a draft.

Discount is the amount below par at which drafts are sometimes purchased.

Exchange is a charge made by a bank when paying checks issued on banks located in other cities, to cover expense of collection. The charge is usually less than 20 cents.

A **bank draft** is a draft drawn by one bank against another. It is usually more acceptable than a personal check, and the expense of collection is less. Banks make a charge for drafts to cover exchange costs—usually 1/10% with a minimum charge of 10 cents.

Bank Discount

DEFINITION.—Bank discount is a deduction from the face value of notes and drafts made in consideration of buying them before maturity.

The **discount** is the simple interest on the face of the draft from day of discount to day of maturity.

The **proceeds** is the difference between the face amount and the discount.

TIME BASIS FOR COMPUTING DISCOUNT.—Banks usually charge interest and discount for the exact number of days from day of discount to day of maturity.

The following table is used by bankers to find the number of days between two dates.

Bankers' Time Table

From Any Day of	To the Same Day of the Next											
	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.
Jan.	365	31	59	90	120	151	181	212	243	273	304	334

Dec.	31	62	90	121	151	182	212	243	274	304	335	365

In Arkansas, Kentucky, Louisiana, Maryland, Missouri (in large cities), North Carolina, Pennsylvania, Utah, and Virginia, both the day of discount and the day of maturity are included in the term of discount.

In all states except Mississippi and Texas, commercial instruments falling due on Sunday or a legal holiday are payable on the succeeding business day. In Mississippi and Texas they are payable on the preceding business day.

The 3 **days of grace** allowed beyond the time fixed for payment in a commercial instrument have now been abolished in most states.

Use of Table.—To find number of days from given day of one month to same day of a following month, follow line of given month to the right until column of same month is reached. Thus from Sept. 22 to Jan. 22 is 122 days. When the days are not the same, find time to same day in later month, then add or subtract according as day in later month is earlier or later than day in earlier month. Thus, to find number of days from July 5 to Sept. 20, find number of days from July 5 to Sept. 5, or 62, and add 15, which gives 77 days.

BANK DISCOUNT ILLUSTRATED.—Find proceeds of a 90-day note of $4,600 dated June 6, 1922, discounted July 3, 1922, at 6%. Collection 1/10%.

June 6 plus 90 days is Sept. 4, the due date.
July 3 to Sept. 4 is 63 days, the term of discount.

Discount	for	60 days	is	$46.00
"	"	3 "	"	2.30
"	"	63 "	"	$48.30

1/10% of $4,600 = $ 4.60 collection charge.
$48.30 + 4.60 = 52.90 bank's total charge.
$4,600 − 52.90 = $4,547.10 proceeds.

Find the proceeds of a 3 months' note of $4,000 bearing interest at 6% dated May 10, 1922, and discounted June 12, 1922, at 6%. Collection 1/10%.

May 10 plus 3 mos. is Aug. 10, due date.
June 12 to Aug. 10 is 59 days, the term of discount.

Interest for 3 mos.	=	$60.
$4,000 + $60	=	$4,060, value of note at maturity.
$40.60	=	discount for 60 days.
.68	=	" " 1 day.
$39.92	=	" " 59 days.
1/10% of $4,060	=	$4.06 collection charge.
$39.92 + $4.06	=	$43.98.
$4,060 − $43.98	=	$4,016.02 proceeds.

True Discount and Present Worth

DEFINITIONS.—True discount is the difference between present worth of a debt and its amount at maturity. Present worth is a sum of money which put at interest would amount to the debt at maturity.

Rule.—To find the present worth of a sum of money due at a given future date, divide the sum by the amount of $1 for the given time at the given rate of interest

Illustration.—What is the present worth of \$100 due in 4 months, interest at 6%?

$\$1 + \$0.02 = \$1.02$ amount of \$1 in 4 mo., interest at 6%.
$\$100 \div \$1.02 = \$98.04$ present worth.
$\$100 - \$98.04 = \$1.96$ true discount.

Partial Payments

DEFINITION.—A partial payment is the payment of part of an obligation.

When interest-bearing notes have more than 1 year to run, the United States Rule is generally applied. It is:

Rule.—1. A payment must first be applied against accrued interest. If it exceeds interest due, the excess should be applied to reduce the principal.

2. Interest must be charged upon interest.

When the time is less than 1 year, the Merchants' Rule is frequently used. It is:

Rule.—1. The face of a note draws interest from date to date of settlement.

2. Each payment draws interest from its date to date of settlement.

Commission and Brokerage

DEFINITIONS.—A **commission merchant** is one who buys and sells goods for another person, called **principal.** A rate per cent, known as **commission** or brokerage, is charged by the commission merchant. A principal who consigns a shipment of goods to a commission merchant is a **consignor,** and the merchant to whom the shipment is made is a **consignee.** The shipment is a **consignment.**

The principles of percentage apply in commission.

Gross sales is the **base.**
Rate of commission is the **rate.**
Commission is the **percentage.**
Net proceeds is the **difference.**
Gross cost is the **amount.**

Illustration.—A sale amounts to \$5,500. Commission is 4%. Find amount of commission, also net proceeds.

4% of \$5,500 = \$220 commission
$\$5,500 - \$220 = \$5,280$ net proceeds

Trade Discount

DEFINITION.—A **trade discount** is a deduction made from a list price to meet market requirements. Trade discounts are used to avoid the frequent publication of revised catalogs. As the market price increases, the discounts allowed are reduced, and vice versa. When two or more discounts are allowed, they are known as a discount series. Discount terms are printed on invoices.

Illustration.—A bill is for \$750, less 33 1/3%, 25% and 10%.

$\$750 - (33\ 1/3 \times 750) = \$500$
$\$500 - (.25 \times 500) = \$375$
$\$375 - (.10 \times 375) = \$337.50$ the net amount

Short-Cuts and Checks

ADDITION BY COLUMNS.—Add each column separately, beginning at the right, placing each result by itself. Then add the totals. Repeat the process, beginning at the left.

Illustration.—

$$
\begin{array}{r}
2175\\
5490\\
6312\\
5865\\
\hline
12\\[-2pt]
\end{array}
$$

$$
\begin{array}{rr}
2175 & 2175\\
5490 & 5490\\
6312 & 6312\\
5865 & 5865\\
\hline
12 & 18\\
23 & 16\\
16 & 23\\
18 & 12\\
\hline
19842 & 19842
\end{array}
$$

"**CASTING OUT 9'S.**"—Add the digits in each number, and divide the sum by 9. Place the remainders to the right of the number. Repeat for all numbers. Find the excesses of 9 in both the remainders and in the total. The results should be the same.

Illustration.—

$$
\begin{array}{rc}
2175 & 6\\
5490 & 0\\
6312 & 3\\
5865 & 6\\
\hline
19842 & 6\\
6 &
\end{array}
$$

SUBTRACTION OF EXCESSES OF 9'S.—Cast out 9's in minuend and subtrahend, and find the difference between the results. This should agree with excess of 9's in the remainder.

Illustration.—

$$
\begin{array}{rc}
465 & 6\\
122 & 5\\
\hline
343 & 1\\
1 &
\end{array}
$$

CASTING OUT 9'S IN MULTIPLICATION.—Find excesses of 9's in multiplier and in multiplicand. The product of these excesses should equal the excesses of 9's in the product.

Illustration.—

$$
\begin{array}{rc}
465 & 6\\
122 & 5\\
\hline
930 & 30\\
930 & \\
465 & \\
\hline
56730 &
\end{array}
$$

$3 = 3$

MULTIPLICATION BY MULTIPLES OF 10.—Move the decimal point to the right as many points as there are 0's in the multiplier.

MULTIPLICATION OF NUMBERS ENDING WITH ZEROS.—Multiply the significant figures. Add as many zeros as there are in both multiplier and multiplicand.

MULTIPLICATION BY 9, 99, 999, ETC.—First multiply by 10, or 100, or 1,000, etc. Subtract original numbers from the result.

MULTIPLICATION BY 25, 50, 75, ETC.—To multiply by 25, first multiply by 100; then divide by 4. To multiply by 50, first multiply by 100; then divide by 2. To multiply by 75, first multiply by 100, then divide by 4, and subtract this quotient from the product.

TO DIVIDE BY 10, 100, 1,000, ETC.—Move the decimal places to the left as many points as there are 0's in the divisor.

TO DIVIDE BY 25, 50, 75, ETC.—To divide by 25, divide by 100; then multiply by 4. To divide by 50, divide by 100; then multiply by 2. To divide by 75, divide by 100; then increase the quotient by 1/3 of itself.

CASTING OUT 9'S IN DIVISION.—Find excesses of 9's in the dividend, divisor, quotient, and remainder. Excesses in dividend equals excesses in remainder + excesses in product of excesses of divisor and quotient.

Illustration.—$6{,}793 \div 147 = 46$, and a remainder of 31.

Excesses of 9's in	$6{,}793 = 7$
" " " "	$147 = 3$
" " " "	$46 = 1$
" " " "	$31 = 4$
	$3 \times 1 = 3$
Excesses of 9's in	$3 = 3$
	$4 + 3 = 7$

Involution and Evolution

DEFINITIONS.—**Involution** is the process of finding powers of numbers. The second power of a number is known as its **square;** the third power, as its **cube.** 16 is the square, and 64 is the cube, of 4.

Evolution is the process of finding **roots** of numbers. The **square root** of 16 is 4; the **cube root** of 64 is 4. The sign ($\sqrt{\ }$) placed before a number indicates that its root is to be found. $\sqrt{4}$ reads, the square root of 4. $\sqrt[3]{64}$ reads, the cube root of 64.

TO FIND THE SQUARE ROOT.—1. Point off the given number into periods of two figures each proceeding in either direction from units place.

2. Find the greatest square in the first period on the left; place its root on the right, like a quotient in division; subtract the square from the period, and to the remainder bring down the next period for a dividend.

3. Double the root found, and place it on the left of the dividend for a trial divisor. Find how many times the trial divisor is contained in the dividend, exclusive of the right-hand figure; place the quotient in the root, and also on the right of the trial divisor.

4. Multiply the complete divisor by the last figure of the root; subtract the product from the dividend, and to the remainder bring down the next period for a new dividend.

5. Double the whole root found, for a new trial divisor, and continue the operation in the same manner until all the periods are brought down.

Illustration.—Extract the square root of 389.745. Point off 389.745 into periods of two figures each, by placing a point over 9, then over 3 to the left, then over 4 and 0 to the right. Proceed according to rule as per example.

$$
\begin{array}{rl}
 & \dot{3}8\dot{9}.7\dot{4}5\dot{0}\ (19.74+ \\
 & 1 \\ \hline
29) & 289 \\
 & 261 \\ \hline
387) & 2874 \\
 & 2709 \\ \hline
3944) & 16550 \\
 & 15776 \\ \hline
 & 774
\end{array}
$$

In case the divisor multiplied by the last figure in the root exceeds the dividend, reduce the last root figure until this product does not exceed it.

TO FIND THE CUBE ROOT.—1. Point off the given number into periods of three figures each, proceeding in either direction from units place.

2. Find the greatest cube in the first period on the left; place its root on the right, like a quotient in division; subtract the cube from the period, and to the remainder bring down the next period for a dividend.

3. Square the root found, and multiply it by 300 for a trial divisor. Find how many times the trial divisor is contained in the dividend, and place the quotient in the root.

4. Multiply the preceding figure, or figures, of the root by the last and by 30, and square the last figure; add the products to the trial divisor; the sum is the complete divisor.

5. Multiply the complete divisor by the last figure of the root; subtract the product from the dividend, and to the remainder bring down the next period for a new dividend.

6. Find a new trial divisor as before, and continue the operation in the same manner until all the periods are brought down.

Illustration.—Extract the cube root of 399.745.

		$39\dot{9}.74\dot{5}00\dot{0}$ (7.36+
		343
$7 \times 7 \times 300 =$	14 700	56 745
$7 \times 3 \times 30 =$	630	
$3 \times 3 =$	9	
	15 339	46 017
$73 \times 73 \times 300 =$	1598 700	10 728000
$73 \times 6 =$	438	
$6 \times 6 =$	36	
	1599 174	9 595044
		1 132956

Anticipation

USE OF TERM.—This is a customary term used in retail business in connection with invoices for purchases which have **dating terms.** Thus, a bill of merchandise is purchased at 2%, 10 days, 90 days extra. If merchandise is received within 10 days from date of invoice, most concerns permit the purchaser to take additional discount at the rate of, say, 6% per annum for 90 days, equivalent to $1\frac{1}{2}$%, in addition to 2% cash discount.

ANTICIPATION RATES ILLUSTRATED.[8]—In computing **anticipation on invoices**, the table on the following pages will be of assistance. The annual rates have been reduced to a daily basis.

This table is based upon 365 days to the year and covers annual anticipation rates from 1% to 10% inclusive, covering periods from 1 to 90 days.

The figures shown opposite the various number of days is the per cent applicable to the respective period, based upon the annual percentage shown at the top of the column.

Invoice dated Mar. 31 for $4,750.90, terms 2%, 10 days, 90 days extra, f.o.b. destination, paid on Apr. 26.

Invoice....................	$4,750.90
Less: Freight..............	30.40
	$4,720.50
Less: Discount 2%.........	94.41
	$4,626.09
Less: Anticipation 6% for 73 days (1.2%, see table)	55.51
Amount of check...............	$4,570.58

The 1.2% anticipation shown above is taken from the table against 73 days and under the 6% column.

It is the custom with some stores to compute the discount on the face of the invoice and the anticipation on the net amount after deducting the discount; then deducting the freight charges. This plan, which favors the purchaser, is illustrated below:

Using the same example as shown above, namely, invoice dated Mar. 31 for $4,750.90, terms 2%, 10 days, 90 days extra, f.o.b. destination, paid on Apr. 27, the computations are as follows:

Invoice....................	$4,750.90
Less: Discount 2%.........	95.02
	$4,655.88
Less: Anticipation 6% for 73 days (1.2%, see table)	55.87
	$4,600.01
Less: Freight..............	30.40
	$4,569.61

[8]Adapted from publications of the Controllers' Congress of National Retail Dry Goods Association.

SECTION 3

CORPORATE ORGANIZATION

CONTENTS

(For list of forms, see complete table of contents.)

SECTION 3

CORPORATE ORGANIZATION

Types of Business Organization

SOLE PROPRIETORSHIP.—The simplest and oldest form of organization is that in which one man is sole owner and manager. Farming and many of the smaller businesses are still carried on in this form. Few large businesses are now conducted in this manner. Many enterprises are started by one man, but if they are successful they evolve into partnerships and ultimately into corporations.

In a sole proprietorship of any size, actual operations of the business are handled by employees of varying degrees of ability and responsibility. The relation between the owner and these is usually that of **principal** and **agent.** Their respective rights and duties are governed by the law of principal and agent.

When any of these employees masters the technique of the business, it is usually deemed safest to make him a partner rather than to have him start as competitor, or to accept a partnership or stock interest in a competing concern. A single owner is at much disadvantage when he tries to conduct one of the largely expanded businesses characteristic of present-day conditions. It is a rare exception where any business achieves marked success and does not shortly become a partnership or a corporation.

PARTNERSHIP.—When two or more persons co-operate to carry on some business for profit, the resulting organization is called a partnership. Of late years, a Uniform Partnership Law has been adopted in a number of the states. Before this law went into effect, the law of partnership was in all essential particulars practically the same in all states. The members of a partnership are called partners and the organization is also termed a firm.

The **essentials of a legal partnership** are:

1. Parties legally competent to bind themselves by contract.
2. An agreement, which if formally written out is termed "articles of copartnership."
3. Partnership property or capital.
4. Some lawful business to be conducted for profit.

The parties must be competent to contract. Minors, insane persons, or others not competent to contract, cannot become partners. Married women formerly could not become partners, but such disability does not probably exist in any of the states today.

A partnership agreement may be formed by word of mouth, or without any express agreement if the parties act as partners. In the latter case, the law implies a contract. An **implied partnership** is where persons are found to have a common fund in which they have a community of interest and to be sharing

the profits and the losses of some lawful business. The law will hold them partners both as between themselves and as to third persons. In all cases the formation of a partnership should be by a carefully drawn written instrument or **articles of copartnership.**

Original **partnership property** is derived from partners' investments. Property purchased with partnership funds becomes prima facie partnership property. If profits are retained in the business, they become partnership property. The firm name, good-will, and any trade-marks used in the business, are partnership property, in which each partner has an interest. On dissolution, after payment of debts, if there are sufficient funds, each partner is entitled first to the return of his investment, then to his share of the profits. Profits are apportioned equally, even though investments vary, unless the articles of partnership expressly provide otherwise. Partners are not entitled to interest on investments or to salary for services unless it is so provided in the agreement.

To make a **legal partnership**, the business must be lawful. The law will not recognize any association which violates the law or carries on any business contrary to public policy. An agreement for association to conduct a lottery, or a gambling establishment, or to make, transport, or sell intoxicating liquor, makes the parties conspirators, not partners.

The **object** must be **to make profits.** Clubs, lodges, societies, and associations of many kinds exist, but unless they are conducting a business for profit they are not held to be liable as partners. In such associations, not organized for profit, members and officers can only be held personally for such contracts and obligations as they have voted for, assented to, or authorized. It is an essential feature of a partnership that the purpose of the association shall be to make profits.

The **two most salient features of a partnership** are:

1. The **full authority of each partner** to bind the firm by contract or by his dealings with the partnership property. Each partner is a general agent for the firm with full powers to act for it in the scope of the partnership business.
2. The **full responsibility of each partner** for all firm obligations. The right to share profits involves the liability to share losses, which liability is not limited, but extends to the whole estate of the partner. This feature of the partnership is the most powerful reason for preferring the limited liability of corporate stockholders.

As between themselves, partners may legally agree to limit the authority of one or all partners, but this agreement does not affect outsiders dealing with the firm. These may always assume that each partner has full authority to bind his associates, and that if the firm becomes insolvent the private estate of each partner is liable to satisfy creditors of the partnership.

Active partners in whose names the business is conducted are termed **general partners.**

A **secret partner** is one whose connection with the business is not known but who shares in profits. In case of insolvency and the discovery of his interest, he is held liable as a general partner. A **silent partner** is one who takes no active part in the business but supplies capital or in some other way entitles himself to share in profits. He is liable as a general partner.

A **special** or **limited partner** is one who goes into the firm but limits his liability to the amount he invests. Such an arrangement can be made only in those states where statutes authorize such restriction on partnership liability.

A partnership may represent the investment of the partners by shares of stock, when it is called a **joint-stock company.** The holders of such stock, however, are held to the full liability of general partners. On this account the form is rarely used.

The partnership organization is nowadays not used for large enterprises of any kind, except to some extent in banking, brokerage, and in various professional and semi-professional callings. J. P. Morgan & Co. have always been a partnership. It is difficult to finance a partnership where funds must be secured from many investors.

EXPRESS TRUSTS.—"Express trusts" are used widely in this country as substitutes for corporations. Corporate taxation and reports are sometimes avoided by their use.

In law a **trust** is created whenever property is placed in possession of one or more persons **in trust** to hold it and to pay over the profits to designated beneficiaries. It is an old legal form usually employed to provide for those unable to do business for themselves. Its use as a means of business combination is recent.

An **express trust** is a trust created by a written instrument called a "declaration of trust," "deed of trust," or "trust agreement." Parties to such instrument are: (1) the creator, (2) the trustee or trustees, and (3) the beneficiary or *cestui que trust.* The property may be real estate, money, goods, chattels, or anything else.

In Massachusetts the corporation law for many years made no provision for organization of real estate companies. Consequently, when it was desired to deal in real estate, it was found practical to deed the property over to trustees to manage, those who had invested or who wished to invest being made beneficiaries. The trustees gave these beneficiaries certificates of trust, which they could transfer in same manner as corporate certificates of stock. Having been sustained by courts for real estate projects, its use has been extended to other lines of business and lately to other states. It is being used somewhat recklessly in some western states. What its future utility as a form of business organization may be, is not entirely certain. Express Trust is also known as "a business trust," or "a Massachusetts trust," or "a common law trust," or "a voluntary association."

When the first combinations in restraint of trade were organized, the form used was an express trust. A controlling stock interest in each corporation to be controlled was transferred to a board of trustees who elected directors to do as they were told. In this way they dominated the trust industries. Until the courts decided that this use of the trust form was in restraint of trade and therefore illegal, the arrangement worked well. It was not the use of trustees that was illegal but the object of the trust. This has given the name ill repute, the word "trust" being still used commonly in the sense of "monopoly." This false idea should be abandoned and its use in ordinary and entirely lawful business should be studied.

Well-known enterprises are organized as express trusts, among them being The Mackay Companies (Postal Telegraph), Amoskeag Manufacturing Co., Massachusetts Gas Companies, and the Montgomery Ward Warehouse Associates. It has also been used by many irresponsible oil companies. So many people have lost money through these that it is likely to give the form undeserved ill repute. Also, such trusts frequently are organized by incompetent parties who do not understand the law. None but a competent lawyer skilled in the laws of the state in which the trust is to operate should advise such form of organization and draft the trust agreement.

Where this form of business organization can be safely used and the trust instruments are properly drawn, it has the following **advantages,** common also to the corporate form:

1. Neither shareholders nor trustees are liable as partners.
2. Shares are transferable as are corporate shares.
3. Trustees can do business and manage the trust property as directors do with a corporate business and property.
4. It can be made reasonably permanent. In most states a trust can be created for one or more lives and 21 years more.
5. It may be dissolved by agreement.
6. An express trust may sue and be sued as readily as a corporation.
7. Shareholders may have accountings and such other information as is proper.

In addition it has these advantages over the corporate form:

8. It can do business in any part of the country as freely as an individual or a partnership. (In some states, however, the members may be held to a partnership liability.)
9. It is not required to make out reports, take out licenses, and pay taxes to the same extent that a corporation is.
10. The trustees may ask for court guidance in some cases where the rights and the powers of the trust are not clear.
11. Under some circumstances it is better to have a continued board of trustees than to have annual elections of directors.
12. If trustees are not elected annually, the trust is not subject to federal income tax.

In each state it is necessary to consult the local statutes to ascertain what taxes and other requirements may be imposed upon such trust associations.

To **avoid partnership liability** there must be a full disclaimer in the trust agreement of any individual liability. This should also be printed on stationery and in particular on all bills, orders, and invoices, and other instruments involving contractual liability.

CORPORATE ORGANIZATION.—Men organize corporations for many purposes. There are municipal, ecclesiastical, charitable, educational, social, membership, and business corporations. The general peculiarity of all these is that many unite to act as one body. In referring to a firm, we say "they." In referring to a corporation, we say "it." A corporation possesses an entity, distinct from its membership. It can take a deed to itself in its own name. If a partnership acquires real estate, it is deeded to the members of the firm by name or to a trustee to hold for the firm.

Corporations are divided into **membership** and **stock** corporations. **Membership corporations** include most religious, educational, charitable, and social organizations. **Stock corporations** include: (1) public utility corporations, to conduct railroads and telegraphs, or to supply water, gas, and electricity; (2) moneyed corporations, to manage financial or banking businesses; and (3) business corporations, for merchandising, manufacturing, mining, and all ordinary businesses conducted for profit.

Stock corporations have capital represented by transferable shares of stock which are issued to the stockholders. As a general rule, stockholders have no liability except to pay for the stock for which they have subscribed. These two features, **transferability of shares** and **limitation of liability,** make the stock

corporation the favored form of modern business organization. With some variations of detail the form is used in every civilized country.

A **corporation is governed**: (1) by the corporation laws of the state in which it is incorporated or in which it is doing business; (2) by the provisions of its charter: and (3) by its by-laws. These three rank as to authority in the order given.

The Charter.—A partnership is a matter of private agreement between the parties immediately concerned. Incorporation must be authorized by the state and in form prescribed by the state. The instrument creating a corporation is the **charter, certificate of incorporation,** or **articles of incorporation.** It is always made a public record.

The charter is the basic law of the corporate organization, answering to the constitution of a state. Holders of stock have the right under state laws and under their charter to adopt by-laws for government of the corporation and the business.

By-Laws.—By-laws are the permanent rules of corporate action as distinguished from motions and resolutions. The latter usually apply only to particular occasions and special matters. By-laws are enacted by stockholders only, unless by statute, charter provision, or action of the stockholders, such power is delegated to the directors. By-laws prescribe how stock shall be issued and when corporate meetings shall be held, and define the duties and powers of directors and officers.

The **primary object of business organization** is to combine good management with sufficient capital to conduct an enterprise profitably. The corporation accomplishes this more effectively than any other form of organization, and has become the usual form in which important enterprises are undertaken.

The **chief advantages of the corporate form** are:

1. Limitation of liability of investors to a definite amount.
2. Distinct entity for legal and business ends.
3. Representation of its capital by transferable shares.
4. Management by an elected board of directors acting through officers and agents.
5. Stability and permanence of organization.
6. Facility of obtaining capital because of these advantages.

At present, practically all manufacturing, merchandising, and mining operations are conducted under corporate form. Nearly all banking, trust business, insurance, and other financial organizations are corporations. All public utilities are corporate bodies. Under no other form is it possible to secure capital and conduct the extended business operations of modern civilization.

Internal Corporate Organization

CORPORATE STOCK.—Corporations for profit are authorized to have a certain fixed capital divided into shares collectively called stock. Those supplying the capital subscribe for as many shares of stock as they are willing to pay for. Thus, if $100,000 is needed to establish and supply working capital for an enterprise, the promoters incorporate under a charter authorizing them to act as a corporation with a capital of $100,000, divided into 1,000 shares of par value of $100 each. An investor who subscribes for 50 shares, pays $5,000 to comply with terms of his subscription. By his **stock subscription** he becomes a stockholder. When he pays his subscription in full he is entitled to a **stock certificate** or certificates evidencing ownership. Par value of shares is usually put

at \$100, \$50, or \$10. Mining and oil company shares are often only \$1 par value.

Sometimes a portion of the stock is issued as **preferred stock.** It is provided in the charter that such stock shall receive a specified annual dividend of 6%, 7%, or 8% before anything is paid to holders of **common stock.** If in any year there is not sufficient surplus profit to pay preferred dividends, or if directors fail to declare a dividend, it is customary to accumulate such passed dividends until paid. The stock is then termed **cumulative preferred stock.**

Within the last decade, many states have authorized issuance of **no-par-value stock.** Shares of such stock are not valued, i.e., have no par value. Each share entitles the holder to a proportionate share of any dividends declared. If a corporation has 10,000 shares of no-par-value stock outstanding and declares a dividend, the holder of one share is entitled to 1/10,000 of the whole amount.

Each share of stock issued entitles its owner to one vote in all stockholders' meetings. Preferred stock is sometimes denied voting privilege by charter provision. It then is **non-voting stock.**

STOCK CERTIFICATES.—Owners of **full-paid stock** are entitled to certificates setting forth ownership, number of shares owned, and par value of shares. If it is preferred stock, details regarding preference are given. The certificates must be signed by two corporate officers, usually the president and treasurer, and have the corporate seal impressed upon them. There is a blank form of transfer on the back of each certificate. Printed forms for such certificates are usually bound in a book, serially numbered, and attached to stubs on which, upon issuance, are entered data necessary for the corporate records.

STOCK TRANSFERS.—When stock is sold, transfer is made by signing the blank transfer form on back of certificate and delivering same to transferee. **When so endorsed in blank,** it may be passed from hand to hand, but until it has been presented to the proper corporate officer for cancellation and issuance of a new certificate in holder's name, the original holder remains the **owner of record,** entitled to vote and receive dividends. In many states corporations are required to keep a **stock book** or **ledger** showing names of stockholders, when they became such, and number of shares held. This stock book is final authority as to who are stockholders of record.

Uniform Stock Transfer Acts are in force in Alaska, Connecticut, Illinois, Louisiana, Maryland, Massachusetts, Michigan, New Jersey, New York, Ohio, Pennsylvania, Rhode Island, South Dakota, Tennessee, and Wisconsin.

STOCKHOLDERS.—Acceptance of a subscription makes the subscriber a stockholder. Failure to comply with terms of payment may cause a stockholder to forfeit his rights, but until forfeiture is declared by formal procedure he remains a stockholder. When stock is purchased, the buyer turns in his certificate for cancellation. He becomes entitled to stockholders' rights only upon issuance to him of a new certificate.

Stockholders possess few rights other than those of voting for directors, for amendment of by-laws at corporate meetings, and sharing in dividends declared. Directors have direct management and control. Stockholders cannot act directly for the corporation in the conduct of its business.

Rights of stockholders are:

1. To be notified of stockholders' meetings, take part in such meetings in person or by proxy, and cast one vote for each share of stock held.
2. When dividends are declared, to share proportionately according to number of shares of stock held.

3. In event of dissolution, to share proportionately in assets remaining after payment of all debts.
4. To inspect corporate books and records to limited extent.

Powers of stockholders are:

1. To amend, repeal, or add to by-laws.
2. To elect directors.
3. To vote on any proposed amendment to the charter.
4. To vote on any proposed dissolution of the corporation.
5. To vote on any proposed sale of the entire assets.
6. To exercise any special powers granted by the charter.

If any illegal action is to be taken by directors or officers, any stockholder may appeal to the courts for relief by injunction.

Liabilities of stockholders are to pay their subscriptions in full. Even though certificates are issued marked "full-paid," stockholders may be liable to creditors for amounts remaining unpaid. In New York, under some circumstances, a stockholder, even though his stock is fully paid, may by special law be held liable for unpaid wages. In California, stockholders are liable for their proportion of corporate debts remaining unpaid after assets of corporation are exhausted. These are exceptions to the rule that in business corporations **owners of full-paid stock have no liability.**

Generally, stockholders of banks and trust companies are liable for an additional amount equal to the face value of their stock if assets are insufficient to pay creditors.

Minority stockholders are entitled to notice of corporate meetings, and may attend and vote. They are entitled to inspect the corporate **stock books** during business hours and may copy the names. Theoretically, they have the right to inspect the books of account, but in a modern corporation with thousands of stockholders, it is necessary to restrict this right. Usually it is necessary to secure an order from a court to examine books of account.

Some corporate proceedings, such as sale of all corporate property, require consent of all stockholders. This gives the minority a veto power. Under the common law, the majority can elect all members of the board, leaving the minority without representation, so that they have no means of knowing when illegal action is contemplated. Representation on the board is an advantage, so, in many states, **cumulative voting** is either prescribed or may be provided for in the charter.

Cumulative voting insures minority representation. The Pennsylvania Constitution provides: "In all elections for directors or managers of a corporation, each member or shareholder may cast the whole number of his votes for one candidate or distribute them upon two or more candidates as he may prefer."

Under cumulative voting the majority control the corporation, but the minority, if their holdings are material, can elect one or more directors. Use of cumulative voting to advantage may require careful calculation. If five directors are to be elected and 100 shares are voting, the holder of 17 shares is able to elect himself to the board.

A **voting trust** is an arrangement among certain stockholders to maintain agreed management of a corporation for a period of time. Such arrangement is legal if not used fraudulently against other stockholders. This form of trust should be distinguished from "express trusts," also from trusts formerly created to establish trade monopolies. A voting trust is created by placing

in the hands of trustees enough stock to elect a majority of the directors. Powers of these trustees are defined by an instrument called the **voting trust agreement,** which is signed by all who enter the trust. This agreement specifies how long the stock is to be held and for whom it is to be voted by the trustees; or that voting is left to the discretion of the trustees. The stock held in trust is transferred to the trustees, certificates being taken out in their names. The trustees issue negotiable trustees' receipts to those who deposit stock. Dividends declared on the trusteed stock are turned over to the equitable owners, the stockholders. In New York and Maryland voting trusts are authorized by statute. In Massachusetts, New Jersey, California, and other states, they have been recognized by the courts. The highest court of Illinois condemned them unqualifiedly as illegal arrangements.

DIVIDENDS.—Dividends may be declared only from **surplus profits,** and directors have power to declare such dividends at discretion. In New Jersey the statute law requires division of all surplus profits. In that state it is customary to grant to directors, by special charter provision, the right to use discretion in declaring dividends.

When directors are unreasonable in refusing to declare dividends, it is sometimes possible to compel them to make such declaration by court procedure. Courts do not act unless abuse of discretion is manifest. Directors are elected to manage the affairs of the corporation, and it is presumed that they do so properly.

When a dividend is declared, it may be made payable at a future date. It was formerly customary to close stock books for transfers a certain number of days before the dividend is paid, so that the officers may know definitely to whom to make out dividend checks. Although this practice is still followed by some companies, many now pay dividends to stockholders of record as of a given date, the books not being closed.

An exception to the rule that **no dividend must impair capital stock,** is made for companies working mines, operating under leases and under patents, and generally dealing with wasting assets. If such corporations are able to pay their debts, they may declare dividends consisting, in part at least, of their original capital.

When dividends are once declared, they are debts of the company. If the company becomes insolvent before a given dividend is paid, it becomes a claim against the company. If stockholders are indebted to the corporation at the time the dividend is payable, their debts may be set off against the dividend.

The amount apparently available for dividends may be improperly increased by charging replacements and repairs to capital instead of to expense and maintenance. Generally, only those expenditures for which stock or bonds may with propriety be issued, may properly be charged to capital account.

Dividends must be equal as between stockholders of the same class. That is, preferred stockholders must all fare alike, and same is true of common stockholders. Time and method of payment must also be the same for all of each class.

The simplest form of dividends is payment in cash. If, however, corporate profits are not in form of cash, and directors do not desire to borrow money with which to pay them, several courses are open to them:

1. Capital stock may be increased by distributing a stock dividend.
2. Bonds may be issued to the amount of the proposed dividend and distributed in lieu of cash.

3. Scrip may be issued against the profits and distributed as dividends.
4. If the property is in such shape that it can be divided, it may be distributed as a property dividend.

In a few states, **stock dividends** are prohibited by statute. In Massachusetts certain classes of public service corporations are forbidden to issue stock or scrip dividends. Generally, stock dividends are unobjectionable. If advantageous to retain profits as working capital, it is proper to do so. The decision of the Supreme Court that such dividends are not income when received by stockholders, has occasioned the payment of many such dividends. The stock dividend must represent real values, not consist in watering existing capital.

Bond dividends may be issued against actual profits at discretion of the directors. Bonds once issued are a continuing obligation and interest on them must be paid when due. Stock dividends create no such liability.

Scrip dividends are issued in many forms. They are a form of deferred dividend. Date of payment may be absolute or contingent. It may be "at the pleasure of the company." In such case the scrip must be paid within a reasonable time.

Property dividends are usually paid in stocks or bonds of other corporations which have come into possession of paying corporation. Such dividends may be paid in other property, but usually this is difficult to divide. When corporations are liquidated, property may be assigned to the stockholders, but in such case it is not properly a dividend but a distribution of assets.

Dividend checks are usually mailed. This is more convenient than sending notice of time and place of payment. When notice is given, it is sent out by the secretary or treasurer, as the by-laws prescribe. In such cases notice is also usually published in a paper of general circulation.

Stockholders of record are legally entitled to receive dividends. The treasurer can safely pay them over to those shown by the books to be stockholders. If some other person has an equitable right to receive such dividend, it is his duty to notify the treasurer. If the treasurer has received such notice, he should pay the dividend to the rightful owner. In case of doubt, it is safest for him to withhold payment until the parties have settled the question of title. If stock is in the name of a married woman, the treasurer must pay her, not her husband, unless her husband has been authorized to receive it as her agent.

THE CHARTER.—The charter is an instrument issued by authority of the state authorizing incorporators to do business under the corporate name. It is also termed "certificate of incorporation" or "articles of association." The United States government grants charters for national banks and has chartered railway companies to construct interstate railways. For all ordinary businesses charters are granted by the states under general laws, by which any group of its citizens may incorporate upon complying with prescribed formalities and paying certain fees. Procedure for incorporation of companies designed to conduct ordinary business is simple. To secure charters for banks, or other financial institutions, is usually more difficult. If franchises to construct railways or other public utilities are sought, under which it may be necessary to condemn private property, requirements are usually even more strict.

In the state of incorporation, companies are known as **domestic corporations.** If they do business in other states, they are there accounted as **foreign corporations**, and must secure licenses and pay certain fees before they can lawfully do business. It is unsafe to do business in other states before securing licenses to do so.

Charters for business corporations usually provide for the following details of organization:

1. Corporate name. This must not resemble the name of any existing corporation in the state.
2. Corporate purposes. These may be set out simply, as "To buy, sell, and generally deal in groceries and foodstuffs." Or it may be amplified at great length, which most clients prefer.
3. Amount of capital stock, shares into which it is divided, and par value of each share. If any stock is preferred, this is set forth, and if any part is to be no-par-value stock, that is also set forth.
4. Location and duration of corporation.
5. Number of directors. In some states, the first board of directors is named in the charter.
6. Names and addresses of incorporators and, usually, number of shares for which each subscribes.
7. It is usual to add any special provision allowed by the state law, such as a provision to give power to hold the stock of other corporations, to use the system of cumulative voting, or to limit the power of directors to incur debt.

The name must not be similar to, or resemble that of any other corporation in the state. Where a partnership is incorporated, it is usually desirable to retain the firm name, which is done by adding the word "Company," or the abbreviation "Inc." For a new organization it is advisable to take some name that is not commonplace and that lends itself to use as a trade-mark. It is not easy later to change a corporate name.

Corporate purposes should be set out at sufficient length to include all that the corporation is likely to undertake. While individuals or firms may do any manner of business or change from one form of business to another at will, corporations are limited to the purposes set forth in their charters, and on this account setting forth the comprehensive purposes of modern corporations is justified. If illegal powers are set out, the charters will not be granted, or, if carelessly granted by the state officials, such grant is void as to such illegal powers, i.e., the charters are good as to the legal parts and void as to the others. If corporations do things not authorized by their charters, as when manufacturing corporations undertake banking, such acts are ultra vires, in plain English, beyond their powers. Corporations cannot enforce contracts relating to ultra vires business, and the directors who vote it may make themselves personally liable.

Amount of **capital stock** which a corporation issues must be set out with precision. If directors issue stock in excess of amount authorized, it is an ultra vires act for which they are answerable. The charter should state number of shares and par value of each. If preferred or other special classes of stock are to be issued, they should be carefully described. If preferred stock is to be issued, amount of preference as to dividends should be stated; whether it is cumulative or not; also whether it is preferred as to assets in event of liquidation; whether it is to participate with the common stock after receiving its preference; and whether it is to be deprived of the voting right. If nothing is said as to voting, preferred stock has same voting right as common stock.

The **location** of a corporation and of its **principal office** should be given. The natural locality for a corporation is the state in which it proposes to do business, but in some cases there is advantage in incorporating elsewhere and doing busi-

ness in the home state as a **foreign corporation.** Sometimes another state is selected to save fees and taxes.

In some states **duration** of corporations is limited to from 20 to 50 years. Usually, however, corporations may be made perpetual, and this is then always done.

The **number of directors** is not always given in the charter. Where it can be given it is best to do so. Three is the minimum. A large board is rarely advantageous, and, if large, most of the real management is turned over to standing committees.

Qualifications of directors are usually prescribed in the statute law relating to corporations. In some states one or more directors must be residents of the state of incorporation. It is usual to require that they be stockholders. Sometimes it is provided in the charter that directors shall own a considerable amount of stock. By such provision it is possible to prevent big stockholders from filling the board with "dummy directors," that is, directors who have been given a share or two to qualify them. Sometimes power is given directors to pass by-laws.

Incorporators who sign the charter are often merely dummies, who drop out as soon as they have acted for their principals through the first meetings. Usually the least number of incorporators possible is three. Each must sign and acknowledge the instrument. Where there are a number of incorporators living in different places, it takes time and trouble to get the instrument properly signed. Hence the preference in some cases for dummy incorporators.

FILING THE CHARTER.—The procedure incident to filing the charter varies. In some states it is filed first with the county clerk. Then a duplicate copy is forwarded to the secretary of state at the state capital. Filing fees are due with each filing, and the organization tax due the state is paid to the officer authorized to receive it. Sometimes state officials scrutinize proposed charters closely and send them back for correction if not in accordance with their ideas. If the charter is satisfactory and all fees are paid, a copy of the instrument is issued under the state seal and signed by the secretary of state. Other copies duly certified can be had on payment of fees.

Generally, the grant of a charter carries without specification the following rights as incidental to the main purpose of corporate operations:

1. **To sue and to be sued in the corporate name.**—A partnership is treated as a collection of individuals and in any litigation each separate partner must be named.

2. **To have a corporate seal.**—The right to use a seal was once highly valued. Usually a corporation is bound by its corporate signature affixed by an authorized officer. The seal is used for deeds, powers of attorney, and certificates of stock.

3. **To buy, sell, and hold property.**—This refers to property required for corporate business and purposes.

4. **To appoint directors, officers, and agents.**—The corporation is managed by its directors and through its officers and agents and necessarily has power to appoint them.

5. **To make by-laws.**—The charter confers a few basic powers, the details of corporate operation being fixed by by-laws adopted by the stockholders.

6. **To dissolve itself.**—Formerly all the stockholders had to agree to a dissolution. In most states the statutes now prescribe some specified majority that can act in this matter.

7. **To do all things necessary.**—The power, for instance, to make shoes gives incidental powers to buy land for a factory, contract for or build a factory, buy machinery and raw materials, employ necessary labor, also have a selling organization. On this account it is not necessary to have the extremely detailed powers set forth in most modern charters.

AMENDMENT OF A CHARTER.—This somewhat troublesome procedure may be made necessary by hasty and unconsidered incorporation. In New Jersey or Delaware an amendment before organization is completed may be arranged with little trouble. After organization is completed any amendment must be made according to statutory procedure in each state.

Generally, to amend a charter requires a duly called meeting of stockholders, at which a two-thirds majority must vote for the proposed amendment. Then the amendment must be signed and acknowledged, and, with evidence that the stockholders' meeting was properly assembled and held, it is filed in same offices as is the original charter. Thereafter, the charter is composed of original charter and amendment taken together, the original charter being in force except as altered by amendment.

Formalities of calling the stockholders' meeting, advertising it, and evidencing what was done in it, vary with states.

BY-LAWS.—Charter forms[1] provide but foundations for corporate structures. Granting a charter confers the right to adopt by-laws for government of the corporate body and regulation of its affairs. A simple by-law form is given.[2] Regulations set forth therein may be expanded into greater detail. By-laws provide for the following essential matters:

1. Issue and transfer of stock.
2. Time, place, and notice to be given for stockholders' meetings.
3. Powers of directors, and time, place and notice required for their meetings.
4. Appointment of officers, and their powers, duties, and compensation.
5. Handling of funds and declaration of dividends.
6. Provisions as to corporate seal and amendment of by-laws.

When a partnership is incorporated and there are few stockholders, all of whom are active in the business, the by-laws may be few and simple, and operations of the corporation may be conducted with little formality; but in a large organization, carrying on extensive operations, by-laws are necessarily more complex.

By-laws may usually be adopted and repealed by majority vote at a regular meeting, or at a special meeting of stockholders called for the purpose. Under some circumstances, by-laws become contracts. In such cases they can only be modified in manner prescribed. Thus, in a New Jersey case where stock had been sold in consideration of a by-law providing that the existing by-laws should not be changed except by a specified majority vote of stockholders, it was held that the by-laws constituted a contract between old and new stockholders and could not be set aside even by an act of legislature.

By-Laws Regulating Stock Issues.—The amount of stock a company may issue is prescribed by charter. Sometimes the charter provision is repeated in the by-laws. Usually it is prescribed that each paid-up stockholder is entitled to a certificate for his stock signed by specified officers, sealed and issued from the certificate book in numerical order, and that a record thereof

[1] See p. 214.
[2] See p. 216.

is to be entered on the stub. It is likewise provided how transfers shall be made, and for how long stock books shall be closed to transfers before elections and dividend days. Provision is sometimes made for redemption of lost certificates.

Treasury stock is sometimes defined as "outstanding stock of the company that has been donated or otherwise acquired." It is held subject to disposal by the directors and can neither vote nor participate in dividends while held by the company. Under such circumstances, treasury stock is considered an asset and is distinguished from unissued stock, which, being merely a right to issue stock, is not an asset.

By-Laws Regulating Meetings.—By-laws usually prescribe when and where regular meetings of stockholders and directors shall be held, what notice shall be given, requirements as to quorum, and order of corporate business at such meetings. They also prescribe how special meetings are to be called—how the notice shall be given as to **time, place,** and **objects** of such special meetings. If elections are to be held at any such meetings, it should be so stated and formalities of procedure should be prescribed.

By-Laws Regulating Directors.—Powers of the board of directors are specified in the by-laws. If there are to be limitations on these powers, they should be set out in the by-laws. It is usual to specify what officers are to be elected by the board and how. If the board has power to fix their compensation, or to remove them, it should be set out in the by-laws. Power of the board to fill vacancies in its own membership should be specified. If the corporation is to have standing committees, their membership, powers, and method of appointment should be set forth. Time and place for directors' meetings, number needed to make a quorum, and order of business at such meetings, should be set forth in detail.

By-Laws Regulating Officers.—By-laws should specify the several officers of the company, give their powers, duties, compensation, or how compensation is to be fixed, and what if any powers of removal exist. Limitations or variations of their usual powers should also be given.

By-Laws Regulating Dividends and Finance.—Power of the board to declare dividends from surplus profits should be set forth. Duty of depositing funds of corporation in a suitable bank in the name of the corporation, and manner of checking out moneys so deposited, should be specified.

Other By-Law Regulations.—It is usual to specify what the seal shall be and who shall have custody of it. Other provisions often relate to method of amending or repealing by-laws. If board has any power to make or repeal by-laws, it should be set out.

Many provisions of the state or common law may often be repeated in by-laws to advantage. For example, provision that no dividend shall be declared that will impair capital of the company is common law and has been re-enacted by legislatures of most states, but it is well to have it repeated in by-laws.

MEETINGS.—All corporate action must be authorized by meetings of stockholders or directors. A corporation must be authorized by the state before it can act in any capacity. When so authorized, an **organization meeting** of incorporators or of the first stockholders is held to elect directors, adopt by-laws, and transact any other business. The directors next meet, elect officers, rent offices, authorize sale of stock, and do anything else that is needed to enable the corporation to begin business. In Maine, Massachusetts, and some other states, this procedure is reversed. There directors and officers are chosen and by-laws are adopted before the corporation is chartered.

Meetings held at times set forth in the by-laws are called **regular meetings.** Meetings held at other times for special purposes are called **special meetings.**

1. **First Meeting of Stockholders.**—The number of incorporators is usually the least allowed by law. When the charter has been granted by the state, the incorporators are usually assembled for the first meeting by a call signed by each one. This call fixes time and place, mentions important business to be transacted, and closes with waiver of additional notice of the meeting. As those who incorporate the company conduct the first meeting and know exactly what they want, desired proceedings are often written out in advance of the meeting. This results in "cut and dried minutes" which are usually followed to the letter. The meeting can, if it wishes, vary these minutes, but usually they are adopted as written. At this first meeting, the charter is presented and accepted by the meeting, by-laws prepared by counsel are read and adopted, and directors are elected. If stock is to be exchanged for property, the exchange is approved by the stockholders and the directors are authorized to close the deal.

2. **First Meeting of Directors.**—This must usually be assembled by all directors joining in the call, thus waiving any additional notice. Such a meeting may be assembled by the procedure prescribed in by-laws, but as this involves delay in giving notice, meeting by a signed call or, if all are present, by unanimous agreement, is the usual plan. The business at this first meeting is to elect officers, authorize the sale or issue of stock, rent offices, adopt a form of stock certificate, accept any stock subscriptions that have been made, and do anything else necessary to start the corporate business.

3. **Regular Meetings of Stockholders.**—Regular meetings of stockholders are the annual meetings to elect directors, hear reports, amend by-laws, and take any action necessary.

In the case of regular meetings of both stockholders and directors, by-laws usually provide for a **notice of regular meetings** to be sent to each person authorized to attend. If this notice is neglected, by-laws themselves are held to give legal notice of time and place.

Regular meetings of directors are usually held on some specified day of each month. They may be held quarterly, or, in some cases, weekly. In large corporations standing committees, that is, executive and finance committees, may set regular times for meetings.

4. **Special Meetings.**—By-laws should provide for calling of special meetings and for notice to be given of such meetings. Special meetings must be called exactly as specified in by-laws, and both **call** and **notice** must give **time, place and particular business** to be brought before the meeting. No business except that mentioned in the call and notice may legally be transacted at the meeting.

DIRECTORS' POWERS AND LIABILITIES.—The board of directors is the managing body of a corporation. Except as restricted by statute, charter, or by-laws, its power is absolute in corporate affairs. It cannot do things outside the regular corporate business, such as dissolve the corporation, sell all its assets, or change the nature of the corporate business. In most states, laws limit its powers and define its liabilities. Thus it is usually necessary for stockholders to authorize any mortgage of the corporate property before directors can act. The **powers of directors are collective,** not individual; i.e., anything within the board's power must be authorized by the board itself assembled in legal meeting. If a particular director is authorized by the board to do a particular thing, he becomes agent of the whole board; but apart from some such special authority, a director has no power.

1. Powers of Directors.—The board of directors is usually given power to appoint officers of the corporation. It has authority to appoint agents and delegate its authority to **standing committees** composed of members of the board. Such standing committees are usually an **executive committee** and a **finance committee.** In large corporations, these committees do most of the work under their respective functions.

Directors are responsible to the stockholders. It is their duty to exercise the same care and diligence in conduct of corporate business that careful and prudent business men exercise in conduct of their own affairs. They should have no personal interest adverse to that of the corporation.

2. Liabilities of Directors.—Directors are personally liable for any losses caused by their ultra vires acts, i.e., by acts authorized by them but which are beyond the legal powers of the corporation. They are also liable for illegal transactions which they have authorized or consented to, or which are committed by agents of the corporation with their knowledge. They may be liable for issuance of stock as full-paid if it is unpaid or only partly paid. They are liable if they declare dividends when there are no surplus profits from which the dividends can be paid legally. They are liable for gross mismanagement. They are not liable for errors of judgment or honest mistakes in handling corporate business.

In most of the important states, special statutory penalties have been imposed for various misfeasances; e.g., in New York a director is personally liable for loaning corporate funds to stockholders, for making false reports, notes or certificates, or for making transfers of corporate property to defraud or prefer creditors.

Criminal prosecutions may follow most statutory offenses. Difficulty often arises from a director's having personal interests adverse to those of his corporation. A director should be careful when he contracts with his corporation. He should withdraw from the room when his contract is discussed and voted upon, and it should be adopted by a quorum in which he is not included. If he is included the contract is voidable, but not necessarily void.

A director may resign when he wishes. His resignation may be peremptory or it may be worded to take effect when accepted. It should be in writing.

Directors have no power to remove a fellow director. The stockholders do so after trial for adequate cause. In some states right of recall is given by which directors may be removed with or without cause by a specified majority, usually two-thirds, but in some cases by a bare majority.

Vacancies on the board may be filled by the stockholders, or, if by-laws so authorize, by the remainder of the board, if there is a quorum. If directors are not elected at the annual meeting, or if it is not held, the existing members hold over and have all powers of directors. In small corporations the same board may run on in this way many years.

In large corporations it is usual to provide in the by-laws for payment of a fee ranging from $5 to $25 for attendance at meetings. Except for performing special service as agents or officers, directors are not entitled to compensation.

In a few states directors are given more or less power to make and amend by-laws. Such power is unusual and unwise. The principal object of by-laws is to enable stockholders to impose limitations and directions on the extensive powers of management belonging to directors.

OFFICERS OF THE CORPORATION.—Sometimes directors are called officers. This leads to confusion. The officers are usually the president, secretary, and treasurer. In small corporations two of these offices may be held by the same person. In large corporations one or more vice-presidents, assis-

tants for secretary and treasurer, a managing director or general manager, a chairman of the board, an auditor, a comptroller and others, may be found. These officers are usually elected by the board, for one year, as soon as possible after the annual election. The new board should usually have officers of its own selection to carry out its policies. Large corporations have many others than those named, but these rank as agents and employees, not as officers.

President and **vice-president** should be chosen from the board, because they may be asked to preside at meetings of the board. Secretary and treasurer may or may not be directors.

Directors have power to fill vacancies of office. Officers cannot be removed except for cause, unless by-laws, charter, or statute law give such authority. When an officer is to be removed for cause, charges must be preferred and opportunity given him for a hearing.

Officers are liable for negligence or active wrongdoing in connection with their duties. Usually the state law prescribes special penalties for making false reports, loaning corporate funds, refusing to allow inspection of stock books, etc.

Duties.—Duties of the respective officers should be set out in the by-laws. If not thus prescribed, the board can prescribe duties within the usual scope of official duties. Such duties are practically the same in all organizations.

The President.—The president is head of the corporation. He usually signs officially all important instruments. He generally supervises the corporate business and reports to the board and stockholders its condition. There is usually some routine business handled by the president without specific authorization. Any transaction outside this routine should be specially authorized by the board. He usually signs certificates of stock. Sometimes he signs or countersigns corporate checks. He signs corporate notes and drafts if in the usual routine of his business. Otherwise he should be specially authorized. He presides at meetings of the board and, in some cases, at meetings of stockholders.

Vice-presidents, in order of precedence, perform the president's duties in his absence, disability, or refusal to serve. In large corporations, some routine business is probably given each vice-president.

The Secretary.—Usual duties of the secretary are: to keep a record of meetings of stockholders and directors, send out notice of meetings, issue stock certificates, notify directors and officers of election, and keep safely corporate records and instruments. He signs or countersigns all such instruments as the board directs, keeps the corporate seal, and attests its impress when affixed to a corporate instrument. He may be given certain duties of correspondence, or other functions in the conduct of corporate business.

The Treasurer.—The treasurer by virtue of office has charge of the company's money and securities. If these are considerable, he is usually required to give bond for their safe keeping and due return to the corporation. He is usually instructed to deposit the company funds in the name of the company in a bank or trust company designated by resolution of the board. He signs or countersigns company checks, and indorses checks and drafts for collection. In small corporations, either the treasurer keeps the books or it is done under his supervision. In large corporations this function comes under supervision of the auditor or comptroller.

General Manager.—The general manager is not concerned with corporate functions. He supervises and conducts the corporation's business operations, managing as he would were he employed by a firm or an individual. His duties

and compensation are fixed by the by-laws or the board. An executive officer is elected for one year, but to secure continued services of a capable manager, the board may contract with him for a term of years. Specifications of such contract should define his term, duties, and compensation.

Counsel.—In large corporations a lawyer or legal firm is retained as part of the management. Counsel for a corporation has no independent authority to act, except as authorized by the board. The duty of counsel is to advise with officers of the company in matters requiring legal advice, prepare or revise contracts, and represent the company in litigation.

CORPORATE RECORDS.—Apart from financial records and books of account, there are certain important books of record peculiar to the corporation. These are, **minute book,**[3] **stock certificate book,**[4] **transfer book, stock book,** and **stock ledger.** These books are kept by the secretary.

The **minute book,** if kept properly, is legal evidence of proceedings at stockholders' and directors' meetings. The secretary is its custodian. Entries in it should be made by him only. Any director has the right to inspect it at any suitable time. It should be in such shape that minutes cannot be easily altered. Minutes are usually entered in conventional form. They should present an accurate record of transactions at each meeting; but not of what is said, unless that is necessary to evidence what is done. Minutes should be approved at the next legal meeting of the body whose proceedings are recorded. When, before such approval, minutes made by the secretary are corrected, the record should show what was stricken out as well as the correction ordered.

CORPORATE OPERATION.—The object of business organization is to combine good management with sufficient capital to conduct some line of business profitably. In a modern business corporation, shareholders furnish the capital, and elect a board of directors to manage the operations of the corporation. The shareholders also adopt by-laws to prescribe powers and authority of the directors. Directors individually have no authority. They act only as a board when legally assembled with a quorum present. As a board their power to manage is limited only by state laws, charter and by-laws passed by stockholders. To carry their plans into effect, they pass resolutions and motions, elect officers, and appoint agents to transact such business as the board directs. Sometimes the board designates certain of its members to act as an executive or finance committee, or both. Such committees have only such powers as are granted by the board or set out in by-laws. If a board member is appointed an officer or agent of the company for any special undertaking, he has the same powers as any other person appointed to the same office or position.

In a **close corporation,** where all stock is held by a small group, the same individuals are likely to be stockholders, directors, and officers. In such case procedure may be informal. Meetings, elections, records, and other formal procedure may be omitted. So long as such corporation is solvent and no one concerned objects, no harm is done.

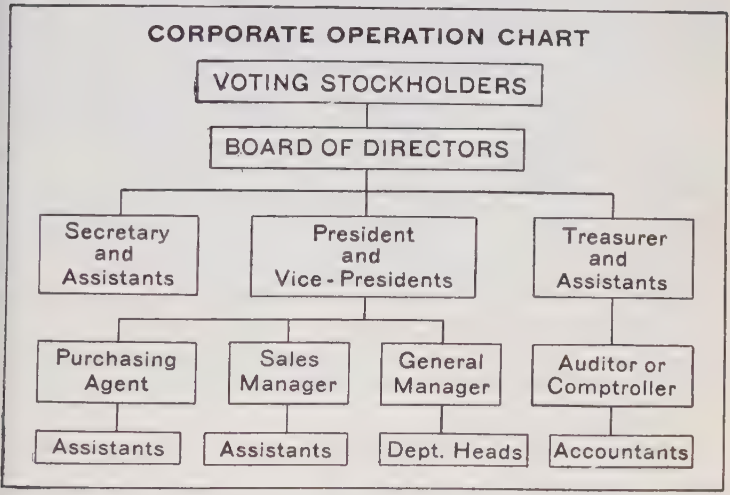
In a large corporation, where stockholders are numerous and scattered, it is not safe to conduct corporate affairs informally. Meetings should be given notice of and held regularly. Elections should be held annually, and careful records kept of the meetings. Everything pertaining to transfer of stock and handling of finances should be conducted as a careful man of business handles his affairs. Officers when elected should give due attention to their duties,

---

[3] See Form 9, p. 222.

[4] See Forms 4–6, pp. 219–221.

neither neglecting them nor interfering with duties that pertain to other offices. Careful records should be kept of corporate proceedings and of financial transactions. When corporate machinery is used intelligently and in good faith, it is the most satisfactory form of organization. The chart given below shows the typical corporate organization, and delegation of authority to directors, officers, and agents.



DISSOLUTION.—A charter is usually granted for a specified term of years. t the expiration of that period, the corporation terminates unless the charter s renewed.

At any time stockholders, by unanimous consent, may surrender their harter and terminate the company's existence.

Usually, the state reserves power to repeal the charter and thus terminate ne corporation at any time. Unless such power is expressly reserved by the ate, a charter is held to be a contract protected by the constitution, which the ate cannot dissolve.

A court can dissolve a corporation when proper application is made to it for isuse or non-use of power.

An ordinary business corporation is dissolved by proceedings in bankruptcy. corporation operating a public utility, in event of insolvency, is usually eorganized in some shape to avoid forfeiture of its franchise.

Usually statutes provide means by which a specified majority of stockholders ay by proper procedure wind up the affairs of a corporation. In such case is necessary to dispose of its assets, pay off its obligations, and divide remaining ssets proportionately among stockholders.

Frequently where small corporations fail to pay and have exhausted their ssets, they dissolve informally by simply stopping.

Corporate Promotion and Financing

CORPORATE PROMOTION.—One who actively engages in the financing and organization of an enterprise under corporate form is called a **promoter.** The legal definition is more restricted: a promoter is one "who brings about the incorporation and organization of a corporation." A promoter usually expects to make a profit out of what he does—in many cases undue profits, and in consequence of this last tendency the name has come into some ill repute. The proper work of a promoter is legitimate and useful.

Abuse of promotion occurs when promoters arrange for issuance of large amounts of stock to themselves and associates for nominal service or for overvalued properties. This can easily be done when the first meetings are held and the whole organization is in the hands of its promoters and their associates. If a corporation, from its business, has not only to pay dividends to stockholders who supply cash, but also has to earn dividends on as much or more stock issued for nominal values to promoters, it is carrying a double burden.

It is legal to **issue stock for property,** but when organization meetings are in hands of promoters, who are in most cases buying their own property, or paying themselves for their own services, the property or services are likely to be overvalued. If later this overvaluation is brought before a court, it will be set aside and the promoters will be compelled to disgorge. In many cases this cannot be done on account of the cost of litigation, or because of the difficulty of enforcing judgments.

This rule is given by an authoritative writer: "There is no rule of law prohibiting a person from forming a corporation for the purpose of selling property to it and making a profit from the sale. The law merely requires that such a transaction be entirely open and free from deception upon the company and those who become members."[5]

In subscribing for stock or buying stock in a new corporation, arrangements with promoters should be carefully examined. Dividends are surplus profits divided among holders of outstanding stock. If a corporation has 1,000 shares authorized, 500 shares being issued to the promoters for patents, services, contracts, etc., and 500 shares are sold at \$100 each to *bona fide* subscribers, each \$100 so paid in must earn enough to pay dividends on \$200 if the cash subscribers are to get fair returns.

No-par-value stock is deceptive when used to compensate promoters. In one case capital stock of a corporation was 200,000 shares of no-par-value stock. Half of this was issued to the promoter in payment for the scheme. He tried to sell 10,000 shares at \$10 a share, seemingly a moderate price. If he had succeeded in selling the amount offered, the corporation would have received \$100,000, the working capital required to finance its business. The promoter would have had ten times as many shares as the cash investors. If there had been profits, he would have received 10/11 and the investors 1/11. For the investors to get a 5% dividend, their money would have had to earn 55%. Yet stock on this basis was sold to good business men.

FINANCING A CORPORATION.—To insure a corporation's success three things are essential:

1. A sound undertaking
2. Sufficient capital
3. Efficient management

---

[5] 1 Morawetz, Sec. 293.

Without these an enterprise will fail. Even if the enterprise is otherwise sound and management is efficient, enough capital must be provided. If $75,000 is raised but $100,000 is needed, the $75,000 will ordinarily become exhausted and the corporation be involved in debt. Efforts made to raise additional money required will fail because no one likes to put money into a corporation already in bad shape.

When an ordinary going business owned by an individual or a partnership is incorporated, it does not necessarily require additional finances. The business is taken over in exchange for stock of the new corporation and thereafter is conducted under corporate form. If desirable to enlarge the business—often the motive for incorporation—a stock issue in excess of the present worth of the business is required. This excess of stock is sold to investors. The working capital is increased by the stock thus sold. Arrangements for disposing of stock are usually made before incorporation is effected.

If it is a new enterprise, on small or moderate scale, arrangements will probably be made to secure the amounts required before organization, although it is not uncommon first to organize the corporation, then to finance it by selling the stock to parties in the vicinity familiar with the proposed enterprise and business ability of those who are to conduct it.

When a larger enterprise is organized or a merger or reorganization of established enterprises is effected, heavy sales of stock and other securities may be necessary. The investing public is then reached through bankers, brokers, and investment houses. Such financing may require services of the largest banks and financial institutions.

CORPORATE SECURITIES.—The general term "corporate securities" is comprehensive, embracing stock of all kinds, bonds of numerous varieties and various forms of notes and similar obligations. Giving shape to and marketing these corporate securities requires skill and experience.

CORPORATE BONDS.—The purchaser of stock becomes a stockholder. His investment not being a debt, does not have to be paid. Neither is there obligation to pay him dividends, except when surplus profits exist, and in the judgment of the directors these are not needed in the business. With bond issues the case is different. Purchasers are creditors of the company. They have a legal claim for interest, and, when due, for the principal of their investment. The advantage to the corporation is that interest is less than dividends should be. If a well-managed corporation can borrow half its necessary capital by means of a 6% bond issue, and can earn 8% or more on capital, the stockholders benefit by the 8% earned on their own investment and secure the extra 2% earned on bond capital. A **corporate bond** is a promise to pay a certain amount at a certain time, meanwhile to pay interest at given times on that amount. It is in practice secured by a **mortgage** or **deed of trust** on all or part of corporate property.

Ownership of a bond carries with it no right of corporate control and no interest in corporate profits. The money paid is a loan to the corporation. The face value of a bond is usually $500 or $1,000, though recently many $100 bonds have been issued. Bonds are usually made payable in gold coin or its equivalent. Interest is usually paid semiannually. **Interest coupons** are usually attached to the bond. Some bonds are registered, giving greater security against loss by the owner. Bonds payable to bearer are more convenient.

A **debenture,** or **debenture bond** is an unsecured bond or obligation of a corporation.

A **convertible bond** is one exchangeable at some time and on certain terms for common stock.

A participating bond, in addition to interest, is entitled to some participation in profits.

A **short-term note** runs from 1 to 5 years. If money is needed to meet a temporary emergency, short-term notes are issued instead of bond. Short-term notes are often issued because the market is not favorable for a long-term bond issue.

A **sinking fund** to pay off a bond issue when due is created by setting aside each year such portion of corporate earnings as will, on maturity of bonds, pay them off. This is especially necessary when the corporate property consists of diminishing or "wasting assets," as in case of oil, mining, and lumber companies.

UNDERWRITING.—If the corporation is large and managed by responsible men, the customary method of disposing of securities is to secure an underwriting agreement with a banking house, bankers, or dealers in securities, by which they agree to pay not less than a given price for the securities within a fixed period. If the underwriters are responsible, the corporation can count on the money at once and proceed with its plans. The full amount of issued securities will be sold, and the venture will not be crippled by getting only part of the amount required.

Usually an underwriting agreement is made with one banking house which invites others to join in the underwriting, sharing risks and profits. The resulting group is an **underwriting syndicate.** Commissions of such syndicates range from 1½% to 10%. They may be payable partly in securities. If the syndicate fails to sell the securities at an advanced price, it may lose heavily when compelled to pay the agreed price.

STOCK EXCHANGES.—When large issues of securities of established companies are to be marketed, it is usually advisable to list them on the stock exchange as soon as possible. A **stock exchange** is a meeting place for sellers and buyers of securities.

Stock exchanges are membership, unincorporated associations issuing no stock. They are practically clubs. Members pay dues, and usually secure membership by buying "seats" from retiring members. Applicants are passed upon by the membership committee, and may be rejected. Stock exchanges are found in all our large cities. They make their own rules. Securities must qualify before being listed and dealt in on the floor of the exchange.

Corporate Combinations

FORMS OF COMBINATION.—American business men have a faculty for combining if advantage is to be gained by co-operation. Combinations having been most frequently employed to enhance prices, to restrain competition, and to create monopolies, they have been the object of denunciation and adverse legislation. The **Interstate Commerce Act** of 1887 was intended to prevent combination of railroads to raise or maintain rates. The **Sherman Anti-Trust Act** of 1891 was directed against combinations in restraint of trade. Most states have similar laws against this abuse. Still the tendency to combine persists and has worked itself out in various forms, among which are:

1. Trusts
2. Holding companies
3. Pooling arrangements
4. Trade associations
5. Interlocking directorates
6. Consolidation and merger

Control of prices has been sought by informal but sometimes very effective arrangements, such as gentlemen's agreements, price-control understandings, "Gary dinners," and the like.

1. TRUSTS.—These, the first great combinations to attract public opprobrium, were formed by appointment of a board of trustees in whose hands was placed a majority of the stock of each corporation to be controlled. The trustees elected boards of corporate directors to manage their respective companies in the common interest.

Among early trusts of this kind were the Standard Oil Trust, the Sugar Trust, and the Bay State Gas Trust. The first two were declared illegal because of monopolistic and trade-restraining characteristics. Thereafter, various other forms of combination were used, and use of the word "trust" to describe a trade combination still continues. **Combination, trade combination,** or **industrial combination** is a better general term.

Trusts of this type should be distinguished from "business trusts," "express trusts," and "Massachusetts trusts," a legitimate form of association for business purposes; also from "voting trusts," by which, when desired to continue a corporation under the same management for a term of years, enough stock to elect a majority of directors may be placed in the hands of voting trustees with instructions for voting the trusteed stock.

After the courts decided that combinations to control an industry cannot be formed by putting stock of the companies to be controlled in the hands of a board of trustees, the plan fell into disrepute and is not now used.

2. HOLDING COMPANIES.—A holding company is a corporation formed to control other corporations by ownership of a majority of their voting stock. Under the common law one corporation cannot hold stock in another corporation except incidentally to save a debt. To buy stock in another corporation involves the purchasing corporation in a new and distinct enterprise. At common law this cannot be done.

Holding corporations in the modern sense came into existence in 1888, when New Jersey passed a law allowing corporations under its law to purchase, hold, sell, mortgage, and transfer stock and securities of other corporations, and to exercise the right to vote on such stock. Delaware and Maine followed, and in New York such rights may be had by making provision in the charter.

As courts had held that combinations cannot be formed by placing stock of corporations to be controlled in hands of trustees, this legislation provided a new plan by which a group of corporations could be unified. Enough stock of each corporation to be controlled is placed in the name of a holding company. This company votes the stock at the annual elections for such directors as can be relied upon to act as it directs or instructs them. It is not usually necessary to hold 51% of a corporation's outstanding stock to control it. If stock is scattered, 40%, or less, is sufficient. A holding corporation usually has full power to conduct the business or industry it is intended to control. It sometimes operates directly, buying or establishing its own factories. Usually those who organize the holding company retain only enough of its stock to insure control, selling the remaining shares to investors. By this plan only half the cost of control need be furnished by the promoters.

In the *Northern Securities Case* and in the cases against the Standard Oil Co. and the American Tobacco Co., the Supreme Court held that control of competing companies by a holding company in such manner as to violate the Sherman Anti-Trust Law was illegal. Where control exercised is not in restraint of trade, and does not lessen competition or tend to create a monopoly, use of

the holding company to form a combination is not illegal. This is the distinction between "good trusts" and "bad trusts."

It is desirable in many cases to effect combinations so that the business of the combined corporations may be conducted more economically. Many such combinations have been held not to be illegal, notably the United States Steel Corporation.

The **Clayton Act** of 1914, relating to corporations engaged in interstate commerce, specifically forbids acquisition by one corporation of the whole or any part of the stock of another corporation "where the effect may be substantially to lessen competition between the corporation whose stock is so acquired and the corporation making the acquisition, or to restrain such commerce in any section or community, or tend to create a monopoly of any line of commerce."

A useful and legitimate variety of the holding corporation is the **parent company and subcompanies.** If an invention is to be exploited, the parent corporation may hold the title to the patents, licensing subordinate companies in each state to handle the invention locally. Sometimes this is done to advantage by a manufacturing corporation desiring to establish selling organizations in each state. In such case it is possible to vary the stock arrangements to meet almost any desired situation.

Corporate stockholders have rights of individual stockholders, if it is legal for them to hold stock. Stock so held is personal property and is liable to taxation as such. The corporate stockholders share in dividends declared on the stock so held, and have full rights of representation and voting at stockholders' meetings. Such stock is voted, either in person or by proxy, by the trustee or the official in whose name it is held, or, if held in the name of the holding company, by such person as is formally designated by the directors to be its proxy.

3. POOLING ARRANGEMENTS.—Use of pools to prevent price-cutting and competition probably antedates use of the trust. In forming a pool, the component bodies retain their own organizations intact, but create a central body to exercise control over: (1) supply of the commodity, (2) market demand, or (3) selling price, or over two or all of these factors. The railroads first used them to avoid disastrous rate wars. Afterwards the plan was used in many large industrial combinations. The anti-trust laws bar their use at this time.

One form of pool operates by allotting a certain amount of business to each unit, then giving concerns manufacturing less than this a bonus based on how far they are below their limit. Concerns exceeding their allowance are fined in proportion to their excess. By thus keeping within the demand of the market, prices are maintained.

Another form of pool curtails output by limiting it, sometimes arranging to close down mills or factories to effect this end.

Another form divides the market, assigning certain territory to each member of the pool. At one time a pool of tobacco corporations and combinations had parceled out the world's markets among their members.

Another plan is to organize a sales corporation to which each member agrees to sell at something below the market price, or else to make the sales corporation its exclusive selling agent. This form has been legalized for all foreign trade under the Webb Act of 1918. Since then many such pools have been formed.

Another plan is to form a pool to control the visible supply of the commodity. This savors too much of speculation to be safe. In several cases it has brought its originators to grief.

The price-fixing pool has often been used. The drug business attempted it. The book trade did likewise, but came to grief in the courts.

Attempts have been made to control prices through ownership of basic patents by a central corporation regulating their use by the members of the pool, but the courts have condemned the plan. In fact, there is no plan by which a pool can be formed that will not come under condemnation of the law if it violates any of the provisions of the Sherman Anti-Trust Act.

4. TRADE ASSOCIATIONS.—A form of association that has had wide popularity is the **"trade association,"** or, on occasion, the **"open-price association."** Trade association is a broad term and cannot be closely defined. It is based on the theory that while most forms of combination are liable to government action as being violations of the anti-trust laws, an association to exchange information, promote better methods of business, and generally to promote the welfare of the particular industry would not be forbidden by law. It is based further on the belief that if full information as to prices charged, orders taken, bids made, and probable future markets is open to all concerns interested in the industry, prices tend to become uniform, and that an intelligent self-interest leads all to sell at about the same level of prices—hence the name "open-price associations."

Trade associations are loose central organizations of the principal corporations engaged in an industry, having for their object gathering and dissemination of trade information among members. They have no fixed form of organization and may be simple membership associations or may be incorporated under the membership corporation law of the state in which situated. They have rules governing membership, meetings, dues, reports, and the like. They maintain certain offices serving as association headquarters. Their principal executive is usually an able secretary who receives, tabulates, and distributes information as to prices, orders, supplies, and demand.

There is a wide range of useful activities for such associations. In most industries there is some organization of the kind to which the major portion of the leading corporations belong. Some associations have been condemned on the ground that they have enhanced prices and restrained competition.

The Supreme Court condemned practices of the American Hardwood Manufacturers' Association which involved not only interchange of trade information but holding of frequent meetings, withholding of price reports from buyers, analysis of trade conditions by an expert, and sending out of letters urging increases in price and restrictions on production, with resulting enhancement of price.

In the recent case of Gypsum Industries Association before the U. S. District Court, a consent decree was entered by which the parties were ordered to dissolve the association and were enjoined from doing anything forbidden by the anti-trust laws. They were then given permission to maintain a non-profit-making corporation for the general welfare of the members, which was to be limited to the following activities:

1. To advance and promote use of gypsum products.
2. To deal with engineering and trade problems incident to the industry.
3. To carry on educational work pertinent to the industry.
4. To furnish traffic information and to assist in transportation problems incident to the industry.
5. To deal with improved methods of plant and mine operation, sanitation, labor, plant, and mine development, and methods of accounting.
6. To maintain a credit bureau to furnish credit information.

The things prohibited by the injunction included about all the usual practices of combinations in restraint of trade.

5. INTERLOCKING DIRECTORATES.—It has been found possible to effect practical corporate combination by having common directors. A majority of common directors is not required for this purpose, but one or two in common are enough to enable two or more corporations effectively to act together to raise prices, restrain competition, and create a monopoly. At times a carefully worked out plan of interlocking directors has been carried out, resulting in a smoothly working combination. In other cases, the same result has happened almost incidentally where men engaged in similar business have become interested in several corporations conducting like undertakings.

To prevent this practice, the Clayton Act of 1914 prohibited directors and officers in banks and other financial institutions under the federal laws, with deposits and capital assets in excess of $5,000,000, from serving on any other similar bank or other financial institution, and prohibited any private banker or officer in a state bank or trust company from being a director in any United States banking association.

The Act also provided that no person should be a director in any two or more corporations in whole or in part engaged in interstate commerce, if any such corporation should have a working capital of over $1,000,000.

This eliminates forming corporate combinations on a scale large enough to be effective in regulating prices or creating monopolies.

6. CONSOLIDATION.—A consolidation or merger of corporations is effected by any of the following four methods:

1. Two or more corporations may be consolidated by statutory procedure in states where laws for the purpose have been enacted.

Such consolidation can be secured only where the statutes prescribe a way. It is the legal method of effecting a consolidation or merger. When this method is followed there is one new corporation which includes in itself all of the rights and property of the merged corporations. Railroads and other public utility corporations often combine by this statutory procedure. Ordinary business and manufacturing corporations can usually accomplish the same end by simpler procedure.

In nearly all states the laws provide for consolidation of non-competing railroads. Such statutes usually apply only to corporations engaged in the same or similar businesses. For instance, a non-competing gas company and an electric light company would be allowed to consolidate. In such cases it is usually specified that a majority, or two-thirds or three-fourths of the stockholders of each railroad or other public utility, must vote in favor of such a consolidation. In many states dissenting stockholders can require the corporation to buy their stock at an appraised valuation. If there is no statutory form for consolidation it can be authorized by unanimous vote of all stockholders.

Usual procedure for statutory consolidation is as follows:

(a) Agreement as to terms by directors of consolidating corporations.
(b) Submission of such agreement to stockholders of consolidating corporations at duly assembled meetings.
(c) Assent of stockholders by statutory majority.
(d) Filing of certified copies of the agreement and of the vote in its favor in the same offices in which the original charter of each of the consolidated companies was filed.

2. One corporation may purchase the entire assets of one or more corporations.

This makes it comparatively easy to combine ordinary business and manufacturing corporations. When desired to consolidate one or more existing corporations, it is possible to use one of the organizations as the permanent corporation, which buys up the assets of the one or more other corporations. It is also not costly to organize a new corporation to supplant all of the corporations to be consolidated.

When an ordinary corporation is to be absorbed into a consolidated corporation in this manner, it is necessary in most states that its stockholders unanimously agree to the sale. This often occasions no little trouble, as some stockholders are likely to object and refuse to sell their shares at a reasonable price. Some diplomacy is required in such cases, as there is no legal way to compel a stockholder to sell out or to vote to sell the corporate assets. When such a sale has been consummated, the corporation that has sold out may divide the price received among its stockholders and then dissolve. The price in such cases is usually wholly or in part in stock or other securities of the purchasing company; if these are divided out, those who receive the dividends become stockholders in the new company and there is usually no reason for keeping up the old company. This method, varied to suit the circumstances, is a practical method of consolidation or merger that can be used whenever all stockholders agree to it.

3. One corporation may lease the entire property of one or more corporations.

In case of a lease the old corporation may continue an inactive existence merely, receiving its rentals and paying them out in dividends to its stockholders. Sometimes the terms of the lease will be the guaranty of an assured dividend on the outstanding stock of the lessor corporation.

4. Consolidation may be effected by the use of a holding company.

When it is desired to secure unity of operations between two corporations, it may be attained by common ownership of a majority of the stock in each. This controlling stock may be held by one individual, by a partnership, by trustees, or by a holding corporation; the effect is the same. If this common control is exercised to enhance prices, to restrain competition and create a monopoly, or for any purpose forbidden by law, it may be destroyed by the proper legal proceedings. So long as it is used for legitimate purposes, it will not be disturbed.

REORGANIZATION.—When a corporation has become insolvent or financially embarrassed, but it has a name, property, franchises, trade-marks, or good-will worth saving, some effort is usually made to reorganize it. The term is a loose one and may be applied to any form of consolidation that has been described, or to an increase of stock to be sold for enough to clear its debts and allow it to start anew. It is in many cases necessary to get the creditors to agree to some adjustment or postponement of their claims. If this cannot be done some of the larger stockholders may raise enough money to buy in the assets of the corporation when they go at forced sale and then organize a new corporation. This new corporation has really no connection with the old. Sometimes such procedure is resorted to fraudulently, the corporation being deliberately allowed to become involved for the purpose of freezing out minority stockholders.

Corporate Forms

Form 1. Charter

CERTIFICATE OF INCORPORATION

of the

HOLLIS BAKERY

First—The name of this corporation is

"Hollis Bakery"

Second—The location of its principal office in the State of Delaware is to be in the City of Wilmington, County of New Castle. The agent in charge thereof is James L. MacPherson.

Third—The objects and purposes for which this corporation is formed are to do any and all of the things herein set forth, as fully and to the same extent as natural persons might or could do, and in any part of the world, viz.:

(a) To manufacture, buy, sell, pack, prepare, and generally to deal in and with breads, biscuits, crackers, cakes, Italian paste, confectionery, cereals, coffees, teas, dried fruits, and foods and food products, and materials of all kinds, either raw or manufactured, that may be used in foods and food products, or for the packing, adapting, preparing, or preserving of such foods, or food products; and generally to mix, adapt, refine, prepare, preserve, manufacture, and dispose of all such goods, wares, merchandise, and materials, either in original packages or in such cans, jars, boxes, cartons, or other containing packages as may be found necessary or desirable.

(b) To purchase, lease, or otherwise acquire lands, buildings, tenements, and factories, in Delaware or elsewhere, for the plants, offices, workshops, warehouses, laboratories, and manufactories of the Company, and to purchase, lease, or otherwise acquire tools, implements, engines, machinery, apparatus, fixtures, and conveniences of all kinds, for the manufacture, manipulation, preparation, preservation, packing, and handling of the materials and products of the Company.

(c) To apply for, obtain, purchase, lease, or otherwise acquire, and to register, hold, own, and use any and all trademarks, trade secrets, processes, formulas, inventions, and improvements capable of being used in connection with the work of the Company, whether secured under letters patent in the United States or elsewhere or otherwise; and to use, operate, and manufacture under the same, and to sell, assign, grant licenses in respect of, or otherwise dispose of and turn the same to the account and profit of the Company.

(d) To do any and all things set forth in this certificate as objects, purposes, powers, or otherwise to the same extent and as fully as natural persons might do, and in any part of the world, as principals, agents, contractors, trustees, or otherwise, and either alone or in company with others.

(e) To have offices, conduct its business, and promote its objects within and without the State of Delaware, in other States, the District of Columbia, the territories and colonial dependencies of the United States, and in foreign countries, without restriction as to place or amount.

Fourth—The amount of the total authorized capital stock of this corporation is Five Hundred Thousand Dollars ($500,000), divided into Five Thousand (5,000) Shares of the par value of One Hundred Dollars ($100) each.

The amount of capital stock with which this corporation will commence business is the sum of One Thousand Dollars ($1,000).

Fifth—The names and places of residence of each of the original subscribers to the capital stock, and the number of shares subscribed for by each, are as follows:

NAMES	RESIDENCES	NO. OF SHARES
HENRY A. HOLLIS	Cincinnati, Ohio	3
JOHN H. MASON	" "	3
FRANK MENCKEN	" "	4

Sixth—The existence of this corporation is to be perpetual.

Seventh—The private property of the stockholders shall not be subject to the payment of corporate debts to any extent whatever.

Eighth—In furtherance, and not in limitation of the powers conferred by statute, the Board of Directors are expressly authorized:

> To make, alter, amend, and repeal the by-laws; to fix the amount to be reserved for working capital, and to authorize and cause to be executed mortgages and liens, without limit as to amount, upon the property and franchises of this corporation.
>
> With the consent in writing, and pursuant to a vote of the holders of a majority of the capital stock issued and outstanding, to dispose in any manner of the whole property of this corporation.
>
> To determine from time to time whether and to what extent the accounts and books of this corporation, or any of them, shall be open to the inspection of the stockholders; and no stockholder shall have any right of inspecting any account, or book, or document of this corporation, except as conferred by law, or the by-laws, or by resolution of the stockholders.

The stockholders and directors shall have power to hold their meetings and keep the books, documents, and papers of the corporation outside of the State of Delaware, at such places as may be from time to time designated by the by-laws or by resolution of the stockholders or directors, except as otherwise required by the laws of Delaware.

It is the intention that the objects, purposes, and powers specified in the third paragraph hereof shall, except where otherwise specified in said paragraph, be nowise limited or restricted by reference to or inference from the terms of any other clause or paragraph in this certificate of incorporation, but that the objects, purposes, and powers, specified in the third paragraph and in each of the clauses or paragraphs of this charter shall be regarded as independent objects, purposes, and powers.

We, the undersigned, being all the original subscribers to the capital stock hereinbefore named, for the purpose of forming a corporation under the laws of the State of Delaware, do make, file, and record this certificate, and do hereby certify that the facts herein stated are true; and we have accordingly hereunto set our respective hands and seals, this sixteenth day of January, A. D. 19—.

HENRY A. HOLLIS [SEAL]
JOHN H. MASON [SEAL]
FRANK MENCKEN [SEAL]

In presence of
JAMES BEHRENS
SAMUEL S. MILLER

STATE OF DELAWARE
COUNTY OF NEW CASTLE } ss..

Be It Remembered, that on this sixteenth day of January, A. D. 19—, personally came before me, Howard Franklin, a Notary Public in and for the county and state aforesaid, Henry A. Hollis, John H. Mason, and Frank Mencken, parties to the foregoing certificate of incorporation, known to me personally to be such, and severally acknowledged the said certificate to be the act and deed of the signers respectively, and that the facts therein stated are truly set forth.

Given under my hand and seal of office the day and year aforesaid.

HOWARD FRANKLIN,
Notary Public

Form 2. By-Laws

BY-LAWS

of the

COLLINWOOD MOTORS COMPANY

Newark, N. J.

ARTICLE I. STOCK

1. **Certificates of Stock** shall be issued in numerical order from the stock certificate book to each stockholder of record whose stock has been paid in full, be signed by the President and Treasurer, and be sealed by the Secretary with the corporate seal. A record of each certificate issued shall be kept on the stub thereof.

2. **Transfers of Stock** shall be made only upon the books of the Company, and before a new certificate is issued the old certificate must be surrendered for cancellation. The stock books of the Company shall be closed for transfer twenty days before general elections and ten days before dividend days.

3. **The Treasury Stock** of the Company shall consist of such issued and outstanding stock of the Company as may be donated to the Company or otherwise acquired, and shall be held subject to disposal by the Board of Directors. Such stock shall neither vote nor participate in dividends while held by the Company.

ARTICLE II. STOCKHOLDERS

1. **The Annual Meeting** of the stockholders of this Company shall be held in the principal office of the Company, in New York City, on the second Monday in January of each year, at 3 P.M. if not a legal holiday, but if a legal holiday, then on the next business day following.

2. **Special Meetings** of the stockholders may be called at the principal office of the Company at any time by resolution of the Board of Directors, or upon written request of stockholders holding one-third of the outstanding stock.

3. **Notice of Meetings,** written or printed, shall be prepared and mailed to the last known post-office address of each stockholder not less than ten days before any regular or special meeting of stockholders, and if for a special meeting, such notice shall state the object or objects thereof. No failure of or irregularity of notice of any regular meeting shall invalidate such meeting or any proceeding thereat.

4. **A Quorum** at any meeting of the stockholders shall consist of a majority of the voting stock of the Company, represented in person or by proxy. A majority of such quorum shall decide any question that may come before the meeting.

5. **The Election of Directors** shall be held at the annual meeting of stockholders, and shall, after the first election, be conducted by two inspectors of election, appointed by the President for that purpose. The election shall be by ballot and each stockholder of record shall be entitled to cast one vote for each share of stock held by him.

6. **The Order of Business** at the annual meeting, and, as far as possible, at all other meetings of the stockholders, shall be:

   1. Calling of roll
   2. Proof of due notice of meeting
   3. Reading and disposal of any unapproved minutes
   4. Annual reports of officers and committees
   5. Election of directors
   6. Unfinished business
   7. New business
   8. Adjournment

ARTICLE III. DIRECTORS

1. **The Business and Property** of the Company shall be managed by a Board of five Directors, who shall be stockholders of the Company and who shall be elected annually by ballot by the stockholders for the term of one year, and shall serve until the election

and acceptance of their duly qualified successors. Any vacancies may be filled by the Board for the unexpired term. Directors shall receive no compensation for their services as such.

2. **The Regular Meetings** of the Board of Directors shall be held in the principal office of the Company in New York City on the third Tuesday of each month, at 3 P.M. if not a legal holiday, but if a legal holiday, then on the next business day following.

3. **Special Meetings** of the Board of Directors may be held in the principal office of the Company in New York City at any time on call of the President, or of any three members of the Board, or may be held at any time and place without notice, by unanimous written consent of all the members, or with the presence and participation of all members at such meeting.

4. **Notices** of both regular and special meetings, save when held by unanimous consent or participation, shall be mailed by the Secretary to each member of the Board not less than five days before any such meeting, and notices of special meetings shall state the purposes thereof. No failure or irregularity of notice of any regular meeting shall invalidate such meeting or any proceeding thereat.

5. **A Quorum** at any meeting shall consist of a majority of the entire membership of the Board. A majority of such quorum shall decide any question that may come before the meeting.

6. **Officers of the Company** shall be elected by ballot by the Board of Directors at their first meeting after the election of Directors each year. If any office becomes vacant during the year, the Board of Directors shall fill the same for the unexpired term. The Board of Directors shall fix the compensation of the officers and agents of the Company.

7. **The Order of Business** at any regular or special meeting of the Board of Directors shall be:

1. Reading and disposal of any unapproved minutes
2. Reports of officers and committees
3. Unfinished business
4. New business
5. Adjournment

Article IV. Officers

1. **The Officers of the Company** shall be a President, a Vice-President, a Secretary, and a Treasurer, who shall be elected for one year and shall hold office until their successors are elected and qualify. The position of Secretary and Treasurer may be united in one person.

2. **The President** shall preside at all meetings, shall have general supervision of the affairs of the Company, shall sign or countersign all certificates of stock, contracts, and other instruments of the Company authorized by the Board of Directors, except as otherwise directed by the board; shall make such reports to the Directors and stockholders as he may deem necessary or as may be required of him, and perform all such other duties as are incident to his office or are properly required of him by the Board of Directors. In the absence or disability of the President, the Vice-President shall exercise all his functions.

3. **The Secretary** shall issue notices for all meetings of stockholders and directors, shall keep their minutes, shall have charge of the seal and the corporate books, shall sign, with the President, such instruments as require such signature, and shall make such reports and perform such other duties as are incident to his office, or are properly required of him by the Board of Directors.

4. **The Treasurer** shall have the custody of all moneys and securities of the Company and shall keep regular books of account and balance the same each month. He shall sign or countersign such instruments as require his signature, shall perform all duties incident to his office or that are properly required of him by the Board, and shall give bond for the faithful performance of his duties in such sum and with such sureties as may be required by the Board of Directors.

Article V. Dividends and Finance

1. **Dividends** shall be declared from the surplus profits of the Company at such times as the Board of Directors shall direct, and no dividend shall be declared that will impair the capital of the Company.

2. **The Moneys** of the Company shall be deposited in the name of the Company in such banks or trust companies as the Board of Directors shall designate, and shall be drawn out by checks signed by the Treasurer and countersigned by the President.

ARTICLE VI. SEAL

1. **The Corporate Seal** of the Company shall consist of two concentric circles between which is the name of the Company and in the center shall be inscribed "Incorporated 1923, New Jersey," and such seal, as impressed on the margin hereof, shall be the corporate seal of the Company.

ARTICLE VII. AMENDMENTS

1. **These By-Laws** may be amended, repealed or altered, in whole or in part, by a majority vote of the whole outstanding stock of the Company, at any regular meeting of the stockholders, or at any special meeting where such action has been announced in the call and notice of such meeting.
2. **The Board of Directors** shall not alter or repeal any by-laws adopted by the stockholders of the Company, but may adopt additional by-laws in harmony therewith.

THIS IS TO CERTIFY that Warren Calvert is the owner of Ten Shares of the Preferred Stock of The Franconia Nursery Company, transferable only on the books of the Company by the said owner, in person or by duly authorized attorney, upon surrender of this Certificate properly indorsed.

The preferred stock represented by this certificate is entitled to an annual dividend of Seven Per Cent (7%) payable out of the net profits of the Company before any dividend is paid upon the common stock. Should the net profits in any year be insufficient to pay said preferred dividend, either in whole or in part, any unpaid portion thereof shall become a charge against the net profits of the Company, and shall be paid out in full of said net profits before any dividends are paid upon the common stock.

Said preferred stock is subject to redemption at the option of the Company at any time after Ten Years from the first day of April, 19—, upon payment of One Hundred and Five Dollars per share and any accumulated dividends.

Said preferred stock is not entitled to vote at stockholders' meetings of the Company, nor to participate in profits beyond its fixed, preferential, cumulative, annual dividend of Seven Per Cent.

Usually the secretary of the company is designated as the attorney who is to make the transfer on the books of the company, though any other suitable person might be named instead.

Form 8. Call for First Meeting of Stockholders

THE BARSTOW MOTOR CORPORATION

CALL AND WAIVER OF NOTICE

FOR

FIRST MEETING OF STOCKHOLDERS

We, the undersigned, being all of the incorporators of the above-named corporation and all of the subscribers to its capital stock entitled to notice of said meeting, do hereby call the first meeting of the stockholders of said corporation to be held in the

office of George H. Madison, 845 Broad St., Newark, New Jersey, at 3 P.M., on the 5th day of January, 19—, for the purpose of receiving charter, adopting by-laws, electing directors, considering and acting upon a proposal for the issue of the capital stock of the corporation in exchange for property, and the transaction of all such other business as may be necessary or convenient in connection with the organization of said corporation, and we do hereby waive all requirements as to notice or publication of the time, place and purposes of this first meeting and do consent to the transaction thereat of any and all business pertaining to the affairs of the Company.

Dated Newark, N. J., December 28, 19—.

(*Signatures of all Incorporators*)

This call and waiver must be signed by every person entitled to be present at the meeting, although the presence of any person not signing the waiver would be held in itself to be a waiver of notice and an acceptance of the call.

Form 9. Minutes of Stockholders' First Meeting

THE BARSTOW MOTOR CORPORATION

of New Jersey

MINUTES OF FIRST MEETING OF STOCKHOLDERS

Held January 5, 19—

Pursuant to written call and waiver of notice signed by all of the incorporators, the first meeting of stockholders of the Barstow Motor Corporation was held in the office of George H. Madison, 845 Broad Street, Newark, New Jersey, at 3 o'clock in the afternoon, on the 5th day of January, 19—.

The meeting was called to order by Howard Milliken, and on motion, George H. Barstow was appointed Chairman of the meeting and Sargent Davis was appointed its Secretary.

The Secretary presented and read the call and waiver of notice pursuant to which the meeting was held. On motion it was ordered to be entered in the Minute Book following the minutes of the meeting.

The proxy of Frank Harris appointing James C. McCormick his representative was presented, and was ordered to be filed.

There were present in person:

NAMES	NO. OF SHARES
George H. Barstow	1
Howard Milliken	1
Sargent Davis	1
Wilson P. Noble	1

There were present by proxy:

NAME	NAME OF PROXY	NO. OF SHARES
Frank Harris	James C. McCormick	1

The Chairman presented a certified copy of the Certificate of Incorporation and stated that the original had been recorded in the office of the Clerk of Essex County on the 3rd day of January, 19—, and was filed in the office of the Secretary of State at Trenton, on the 4th day of January, 19—, and that the organization tax, and statutory filing and recording fees have been duly paid. On motion it was ordered that the said Certificate of Incorporation be entered on the first pages of the Book of Minutes.

The Secretary presented a form of By-Laws prepared by counsel for the Company, which was read article by article, and as a whole unanimously adopted and ordered to be entered in the Book of Minutes immediately following Certificate of Incorporation.

The Chairman announced that the next business in order was the election of seven directors as provided in the By-Laws, and thereupon appointed Messrs. Harold Conrow and John Miner inspectors. Said inspectors then proceeded to open the polls and receive ballots. All the stockholders present in person or by proxy having voted, the inspectors reported that ballots were cast as follows:

FOR DIRECTORS	VOTES
George H. Barstow	5
Howard Milliken	5
Sargent Davis	5
Wilson P. Noble	5
Frank Harris	5
Harvey Crawford	5
Ellis C. Sherman	5

and that the gentlemen named were therefore duly elected directors of the Company. It was ordered that the report of the inspectors be entered in the Minute Book following the minutes of the meeting.

On motion duly made and seconded, the following resolution was unanimously adopted:

> Resolved, That the principal office of this Company in the State of New Jersey shall be at No. 845 Broad Street, Newark, and the agent in charge upon whom process may be served, shall be George H. Madison.

The Secretary presented a waiver of notice of assessment and of the time and place of payment thereof signed by all the incorporators. The waiver was ordered to be entered in the Minute Book following the minutes of the meeting.

The Secretary presented a proposal from George P. Willis of Montclair, New Jersey, offering to assign to the Company in exchange for its entire common stock, the United States letters patent granted him for motors of the internal combustion type, together with his agreement to assign to the Company any future inventions or improvements made by him in motors of the internal combustion type.

Said proposal was ordered received and the following resolution in regard thereto was moved, seconded and unanimously adopted:

> Whereas, George P. Willis, for and in consideration of the issue to his order of the entire common stock of this Company of the par value of Two Hundred Thousand Dollars ($200,000), has offered to sell and assign to this Company the United States right for his improvements in motors of the internal combustion type, together with his agreement to assign to the company all future improvements and inventions in motors of the internal combustion type, all as set forth in his written proposal submitted to this meeting; and
>
> Whereas, It appears to the stockholders of this Company that such property is necessary for the business and lawful purposes of the Company, and that the same is of the reasonable value of Two Hundred Thousand Dollars ($200,000);
>
> Now, Therefore, Be It Resolved, That the Board of Directors of this Company be and hereby are authorized and empowered and directed to accept the said proposition and to issue the said common stock of this Company in exchange for the said letters patent and agreement of the said George P. Willis.

There being no further business, the meeting was declared adjourned.

George H. Barstow,
Chairman

Sargent Davis,
Secretary

In pursuance of the motions of the preceding minutes, the following forms are entered in the minutes:

1. Certificate of Incorporation
2. By-Laws
3. Call and Waiver of Notice
4. Report of Inspectors of Election
5. Waiver of Notice of Assessment

Sargent Davis,
Secretary

Important instruments received during the course of a meeting are frequently ordered embodied in the minutes or entered in the minute book immediately following the minutes. There is no legal objection to either arrangement. The minutes are, however, clearer and more closely connected when the instruments are appended instead of being brought into the body of the minutes.

Form 10. Call for First Directors' Meeting

CALL FOR FIRST MEETING OF DIRECTORS

of the

BARSTOW MOTOR CORPORATION

We, the undersigned, Directors of the Barstow Motor Corporation, hereby call the first meeting of the Directors of said Company to be held in the office of George H. Madison, at 4 P.M. on the 5th day of January, 19—, for the purpose of electing officers acting upon a proposal to assign property to the Company in exchange for stock, and doing all such other things as may be necessary or desirable in connection with the organization of the Company and the promotion of its business.

(*Signatures of all directors*)

New York City,
December 30, 19—.

At this first meeting of directors, officers are to be elected and various details connected with the commencement of the corporate business are to be attended to, including the taking over or purchase of property to be acquired by the new corporation. The following minutes are of a New Jersey corporation and comply with the requirements of that state. They may easily be adapted to meet requirements of other states.

Form 11. Minutes of Directors' First Meeting

THE BARSTOW MOTOR CORPORATION

of New Jersey

MINUTES OF FIRST MEETING OF DIRECTORS
Held January 5, 19—

Pursuant to written call and waiver of notice, the Board of Directors of The Barstow Motor Corporation held its first meeting in the office of George H. Madison, 845 Broad Street, Newark, New Jersey, at 4 P.M., on the 5th day of January, 19—.

Howard Milliken called the meeting to order and on motion, George H. Barstow was appointed Chairman, and Sargent Davis was appointed Secretary of the meeting.

There were present:

George H. Barstow
Howard Milliken
Sargent Davis
Wilson P. Noble
Harvey Crawford
Ellis C. Sherman

constituting a quorum of the Board. Absent: Frank Harris.

The Secretary presented the call and waiver of notice signed by all the Directors, pursuant to which the meeting was held. It was ordered spread upon the Minute Book immediately following the minutes of the meeting.

The Chairman announced the first business in order to be the election of officers to serve for the remainder of the corporate year and until the election of their successors, and appointed Messrs. Howard Milliken and Ellis C. Sherman tellers to conduct the election. The votes of those present were duly cast by ballot, resulting in the unanimous election of the following officers:

President....................George H. Barstow
Vice-President....................Frank Harris
Secretary........................Sargent Davis
Treasurer....................Harvey Crawford

It was ordered that the Secretary be sworn and subscribe a written oath of office, and that said oath be spread upon the Minute Book immediately following the minutes of the present meeting. The Secretary thereupon took said oath and entered upon the discharge of his duties.

It was ordered that the Treasurer give bond as provided in the by-laws, in the sum of Five Thousand Dollars ($5,000), the form and sureties of same to be approved by the Board of Directors. The Treasurer thereupon submitted a bond signed by himself as principal and by the Fidelity Surety Company of Maryland as surety. The bond as presented was approved and ordered to be filed in the custody of the Secretary of the Company.

Upon motion duly made and seconded the following resolutions were unanimously adopted:

> Resolved, That the officers of the Company be authorized to lease an office for the use of the Company at 80 Broadway, New York City, the rental thereof not to exceed One Hundred and Fifty Dollars ($150) per month, and that the meetings of the Board of Directors be from time to time held there or at the designated office of the Company in the State of New Jersey as the Board of Directors may direct.
>
> Resolved, That the Treasurer be and hereby is authorized and instructed to open an account for the Company with the Irving National Bank of New York City, and to deposit therein all funds of the Company coming into his possession, such account to be in the name of the Company and funds deposited therein to be withdrawn only by check signed by the Treasurer and countersigned by the President.
>
> Resolved, That certificates for common and preferred stock as submitted to the Board and identified by the signature of the President, be and hereby are adopted as the stock certificates of the Company, and that the same be spread on the pages of the Minute Book immediately following the minutes of the present meeting.
>
> Resolved, That the Secretary be instructed to procure Five Hundred (500) certificates of common stock and Five Hundred (500) certificates of preferred stock in form as adopted, also a corporate seal as provided in the by-laws, and in addition thereto such records, stock and transfer books, books of account, and stationery and office supplies as may seem necessary for the proper conduct of the Company's operations and business
>
> Resolved, That the Treasurer be hereby authorized and instructed to pay from the Company funds all expenses properly incurred in connection with the incorporation of the Company, the total of such payments not to exceed Eight Hundred Dollars ($800).
>
> Resolved, That an assessment of One Hundred Per Cent (100%) be levied upon the shares of stock subscribed for by the incorporators as shown by the certificate of incorporation.
>
> Resolved, That the Secretary prepare the certificate of election of directors and officers required by the New Jersey statutes, and that the proper officers of the Company execute and file the same in the office of the Secretary of State of New Jersey within thirty days from date, and that a copy thereof be spread upon the Minute Book immediately following the minutes of the present meeting.

The President then brought to the attention of the meeting (1) the written proposal of Mr. George P. Willis of Montclair, New Jersey, to transfer and assign his patents for improvements in motors of the internal combustion type to the Company, together with an agreement to assign all future inventions and improvements in motors of the internal combustion type made by him, in exchange, and full payment for the entire common stock of the Company; and (2) the resolution of the stockholders approving said proposal and instructing the Board of Directors to accept the same.

Mr. Willis' proposal was ordered received and spread upon the Minute Book immediately following the minutes of the meeting, and on motion duly made and seconded the following resolution relating thereto was unanimously adopted.

> WHEREAS, The Patents and agreement offered by George P. Willis in exchange for the entire common stock of this Company is adjudged by this Board to be of the reasonable value of Two Hundred Thousand Dollars ($200,000) and to be necessary for the use and lawful purposes of this Company:
>
> NOW, THEREFORE, BE IT RESOLVED, That the said proposed assignment of Letters Patent and the agreement for the assignment of future rights and patents in exchange for the entire common stock of this Company, as set forth in the said proposition of George P. Willis and spread upon the Minute Book of this Company is hereby accepted and the proper officers of the Company are hereby authorized and instructed to receive the duly executed assignments and agreements of said George P. Willis in form approved by counsel for the Company, and to issue in exchange therefor the entire common stock of the Company consisting of Two Thousand (2,000) Shares of the par value of One Hundred Dollars ($100) per share, to such person or persons as may be designated by the written orders of the said George P. Willis, and to do all other things necessary and convenient to consummate the said exchange and issue of stock for property.

There being no further business, the meeting was adjourned.

SARGENT DAVIS,
Secretary

GEORGE H. BARSTOW,
President

In pursuance of the motions of the preceding minutes, the following forms are hereunto appended:

1. Call and Waiver of Notice
2. Secretary's Oath of Office.
3. Report to Secretary of State.
4. Forms of Stock Certificates—Common and Preferred
5. Written Proposal of George P. Willis to Exchange Patents for the Common Stock of the Company.

SARGENT DAVIS,
Secretary

Form 12. Notice of Annual Meeting

HARMON PUBLISHING COMPANY

765 Main Street, Dover, Delaware

May 1, 19—

MR. FRANCIS H. JAMIESON,
336 Ocean Ave., Atlantic City, N. J.

DEAR SIR:

You are hereby notified that the annual meeting of the stockholders of the Harmon Publishing Company will be held at the office of the Company in Dover, Delaware,

on Tuesday, May 15, 1923, at 10 A.M., for the elections of five Directors for the ensuing year and for the transaction of such other business as may come before the meeting.

The stock transfer books of the Company will be closed at 3 P.M., May 5, 19—, and remain closed until 10 A.M., May 16, 19—.

Respectfully,

JAMES H. HOWARD,

Secretary

Notice of the annual meeting must be sent out in accordance with the requirements of the by-laws.

At the expiration of the specified term the following proxy becomes null and void without formal revocation or other action on the part of the maker.

Form 14. Proxy—Time Limited

PROXY

I, the undersigned, do hereby constitute and appoint Henry M. Williams my true and lawful attorney to represent me at all meetings of the stockholders of the Carney Falls Power Company held on or prior to the 15th day of June, 19—, and do hereby

authorize and empower him for me and in my name and stead to vote at such meetings upon the stock now standing in my name on the books of said Company, and I hereby grant my said attorney all the power at said meetings that I should myself possess if personally present thereat.

Witness my signature and seal this 1st day of February, 19—.

SAMUEL B. FREMONT [L. S.]

In the presence of
J. J. MASTERSON

Form 15. Revocation of Proxy

REVOCATION OF PROXY

KNOW ALL MEN BY THESE PRESENTS:

That I, the undersigned, do hereby revoke and annul any and all proxies or powers of attorney heretofore given by me, authorizing or empowering any person or persons to represent me, or vote in my name and stead or act for me in any way whatsoever at any meeting or meetings of the stockholders of the Carney Falls Power Company.

Witness my signature and seal this 10th day of May, 19—.

DANIEL H. RONALDS [L. S.]

In the presence of
JOHN H. DUNN

The foregoing revocation of outstanding proxies is sweeping in its terms. If some particular proxy is to be excepted from the general revocation, such proxy may be specifically reserved, or otherwise the revocation may itself be limited by its terms to the one or more proxies to be revoked, in which case any other outstanding proxies are not affected.

The following is a simple form of resolution authorizing the treasurer to open a bank account. It should be certified before submission to the bank.

Form 16. Directors' Resolution to Open Bank Account

RESOLVED, That the Treasurer be and hereby is authorized and instructed to open an account for the Company with the Irving National Bank of New York City, and to deposit therein all funds of the Company coming into his possession, such account to be in the name of the Company and funds deposited therein to be withdrawn only by check signed by the Treasurer and countersigned by the President.

Form 17. Directors' Resolution Authorizing Contract

RESOLVED, That the President and Secretary be and hereby are authorized and instructed to enter into a Contract with the Wilbur Collins Construction Company on behalf of this corporation, for the erection of a power house, the construction of said power house to be in accordance with the plans and specifications on file in the office of this corporation, and the cost thereof not to exceed Twenty-Five Thousand Dollars ($25,000), payment thereof to be made as set forth in the written proposition heretofore submitted to this corporation by the said Wilbur Collins Construction Company.

Form 18. Dividend Notice—Common Stock

OFFICE OF
AMERICAN DREDGING COMPANY

No. 145 BROADWAY, NEW YORK CITY,
April 4, 19—

QUARTERLY COMMON STOCK DIVIDEND No. 23

The Directors of the American Dredging Company have this day declared a dividend of Two Per Cent on the Common Capital Stock of the Company, payable May 15, 19—, to stockholders of record April 28, 19—. The books of the Company for the transfer of Common Stock will be closed at 3 P.M., April 28, 19—, and will be reopened May 2, 19—.

M. W. ERICKSON,
Treasurer

Form 19. Dividend Notice—Common and Preferred Stock

AMERICAN RADIATOR COMPANY
PREFERRED DIVIDEND
COMMON DIVIDEND

A dividend of one and three-quarters per cent., being the 92nd consecutive quarterly dividend, has been declared on the Preferred Stock, payable February 15, 19—, to stockholders of record close of business February 1, 19—.

A dividend of One Dollar per share, being the 70th consecutive quarterly dividend, has been declared on the Common Stock, payable March 31, 19—, to stockholders of record close of business March 15, 19—.

The Transfer Books will not close.

WETMORE HODGES,
Secretary

When the corporate signature is affixed to important instruments, usually—though not necessarily—two or more official signatures are employed. The seal is also usually affixed even when not legally necessary. It is to be remembered that seals were used before signatures and for many years corporations used seals, unaccompanied by written signatures, in attestation of their acceptance of the instruments to which their seals were affixed.

Form 20. Corporate Signature—Formal

WESTERN CHEMICAL COMPANY,
By JOSEPH H. MCCLEARY,
President
FREDERICK WELLMAN,
Secretary

{CORPORATE SEAL}

The corporate signature may be legally affixed by any corporate official or agent authorized thereto by the directors or by-laws. In all current business however, where but one signing officer is desired, the president is usually designated, unless the transaction pertains specially to the department of some other official.

Signatures affixed to formal instruments are customarily preceded by an explanatory statement termed a "testimonium clause." Common forms of testimonium clauses follow.

Form 21. Testimonium Clauses—Corporate Signature—Seal Attested

(1) IN WITNESS WHEREOF, the said Powell Steel Company has caused its corporate name to be hereunto subscribed by its President and its duly attested corporate seal to be hereunto affixed by its Secretary, all in the City of Hartford, State of Connecticut, on the 12th day of January, 19—.

{CORPORATE SEAL}

POWELL STEEL COMPANY,
By ALEXANDER H. McDOWELL,
President

Attest seal:
FRANKLIN B. LORD,
Secretary

---

(2) IN WITNESS WHEREOF, the said corporation has hereunto affixed its corporate signature and seal, acting through its President and Secretary, duly authorized thereunto, all being done in the City, County, and State of New York, this 1st day of February, 19—.

HORLICK CARPET CORPORATION,
By HOWARD HORLICK,
President

{CORPORATE SEAL}

WILLIAM JOHNSON,
Secretary

Form 22. Testimonium Clause—Two Corporate Signatures

IN WITNESS WHEREOF, the said parties of the first and second parts have caused their respective corporate signatures and seals to be hereunto affixed by their duly authorized officers, in the City, County, and State of New York, on the day and year first above written.

{CORPORATE SEAL}

ARLINGTON BRASS WORKS,
By HENRY BRIERLY,
President

Attest seal:
JOHN H. SAVAGE,
Secretary

{CORPORATE SEAL}

NEWARK CASTINGS COMPANY,
By HORACE D. POWERS,
President

Attest seal:
HENRY M. SUNTHEIN,
Secretary

Form 23. Corporate Note—By President

$500.00

New York, April 5, 19—

Ninety days after date the Hillman Dredging Company promises to pay to the order of Howard P. Hunt the sum of Five Hundred Dollars.

Value Received.

Hillman Dredging Company,
By Nathaniel Potter,
President

Payable at
Irving National Bank,
New York

Form 24. Corporate Note—By Treasurer

$2,500.00

Boston, Mass., December 1, 19—

Four months after date the Hanover Securities Company promises to pay to the order of James C. Bennett the sum of Twenty-five Hundred Dollars, with interest from date until paid, at the rate of Six Per Cent per annum, at the Sedgwick National Bank of Boston.

Value Received.

Hanover Securities Company,
By William Curtiss,
Treasurer

No. 725
Due April 1, 19—

The preceding notes are in the simplest form. The corporate signature is affixed by one officer or by two as may be customary or required by by-law provision or directed by the board.

When a corporate acknowledgment is taken, the notary should not be an officer or stockholder of the corporation. The form of acknowledgment is usually regulated by statute and therefore varies in almost every state. The following form of corporate acknowledgment is that prescribed by the statutes of New York.

Form 25. Notarial Acknowledgment—New York

State of New York }
County of New York } *ss*:

On this 16th day of March in the year 19—, before me personally came John J. Kerry, to me known, who, being by me duly sworn, did depose and say that he resided in the City of New York; that he is the President of the Kerry Machine Works, the corporation described in and which executed the above instrument; that he knew the seal of said corporation; that the seal affixed to said instrument was such corporate seal; that it was so affixed by order of the Board of Directors of said corporation, and that he signed his name thereto by like order.

John J. Kerry

Sworn to before me the
day and year aforesaid.
(*Notarial signature and seal.*)

SECTION 4

CORPORATIONS

CONTENTS

(For list of forms, see complete table of contents.)

SECTION 4

CORPORATIONS

CORPORATE RECORDS.—Certain records are peculiar to corporate organization. Some of these form part of the accounting records; others do not. In some states certain of these are specified by statute. The usual ones are:

Minute Book	Register of Transfers
Subscription Records	Stock Ledger
Instalment Receipts	Dividend Book
Instalment Book	Bond Register
Stocks Certificate Book	

Certain of these may be specified in the by-laws. It may be advisable to consult both the statutes and the by-laws to determine the requirements. In addition to prescribing certain books, the statutes may specify where and how they must be kept and what they must contain. Not all necessary records need be prescribed either by statutes or by-laws. The size of the corporation and the nature of its business must be taken into consideration in determining what books are necessary. It is essential that all transactions be accurately and systematically recorded. Small corporations sometimes employ a **combination record,** which is divided into parts, each taking the place of one of the separate records mentioned above.

Capital Stock

CAPITAL STOCK ENTRIES.—Opening entries on corporate books must be clear and complete. It is especially important that the journal entries be accompanied by all data which may be necessary at any time to throw light on the situation. The following classification of entries covers various conditions of stock issues:

1. Entries for original issues of stock sold under different conditions.
2. Entries relating to stock donated to the treasury.
3. Entries where an original issue of stock or treasury stock is given in direct payment of corporate obligations.
4. Entries relating to purchase and sale by corporation of its own stock (not an original issue). and of other stocks.

PAR-VALUE STOCK.—Preceding the formal entry of stock authorized or subscribed there should be brought in a short statement of facts relative to

organization. In case of a reorganization or the incorporation of a partnership this preliminary statement may be expanded into a concise history of preceding events of importance. The following is illustrative:

> The Acme Hardware Co., organized under the laws of the State of New York, begins business this day with an authorized capital stock of $300,000, consisting of 3,000 shares of a par value of $100 each, all of which were subscribed at par, as follows:
>
> | | | |
> |---|---|---|
> | S. O. Gordon | 1,000 | shares |
> | J. B. Mullen | 800 | " |
> | M. L. Smith | 600 | " |
> | T. J. Donovan | 600 | " |
>
> These subscriptions have all been paid in cash, except that of S. O. Gordon, who turned over merchandise valued at $20,000 and real estate valued at $50,000 and paid the balance, $30,000, in cash.

If a **formal journal entry** is desired to show the total authorized stock regardless of whether it is all subscribed and issued, the following is suitable:

Unissued Capital Stock	$300,000	
Capital Stock Authorized		$300,000

For authorization by charter of an issue of $300,000 of capital stock, consisting of 300 shares of a par value of $100 each.

The above entry has a better justification for its use when the total amount authorized is not at once issued. Assume that of the $300,000 authorized $200,000 is issued for cash, while the remaining $100,000 is held for future requirements. The first entry would be as above. The next entry would show the issue of $200,000 of stock for cash, thus:

Cash	$200,000	
Unissued Capital Stock		$200,000

For cash received by the company in full payment of following subscriptions:

P. S. Arthur	1000	shares
S. O. Miller	400	"
T. P. Moses	500	"
L. D. James	100	"

In case of the Acme Hardware Company illustration the formal entry would be followed by an entry showing receipt of cash, merchandise, and real estate, thus:

Cash	$230,000	
Merchandise	20,000	
Real Estate	50,000	
Unissued Capital Stock		$300,000

For cash, merchandise, and real estate received in full payment of capital stock issued.

When these entries are posted, proper ledger accounts must be set up. These are, in outline, as follows:

Capital Stock Authorized

Debit: For any reduction in the amount of authorized stock.	**Credit:** For amount of capital stock authorized by the charter.

Capital Stock Unissued

Debit: For amount of capital stock authorized by the charter.	**Credit:** For amount of capital stock issued.

When **preferred** and **common** stocks are issued, distinctive titles should be employed for each. Instead of the accounts, Capital Stock Authorized, and Capital Stock Unissued, there would be Preferred Capital Stock Authorized, Common Capital Stock Authorized, Preferred Capital Stock Unissued, and Common Capital Stock Unissued. The same principles apply as when but one class of stock is issued.

When no **Capital Stock Authorized account** is kept, the actual amount of stock issued is credited to a Capital Stock account at its par value. In this case the balance of Capital Stock account indicates par value of stock issued and outstanding. The original amount authorized does not appear, unless merely in the form of explanatory matter preceding or following the opening entry. Tendency is to use a Stock Authorized account, thus showing amount of authorized stock. Outstanding stock at any time is found by deducting stock unissued from stock authorized.

FUNCTION OF CAPITAL STOCK ACCOUNTS.—The capital stock accounts show par value of stock outstanding. They represent net worth in somewhat the same sense as do proprietor's and partners' accounts; but in case of stock having par value, profits and losses are not added to or deducted from capital stock accounts, as is sometimes done in case of no-par-value stock.

SUBSIDIARY STOCK RECORDS.—Certain books and records are necessary for adequate handling of capital stock, summarized in the controlling Capital Stock account, which is the equivalent of the difference between the balances of the Capital Stock Authorized account and the Capital Stock Unissued account, when the latter are kept.

The **stock ledger** or **book** is controlled by the Capital Stock account. It shows stock acquired, transferred, and number of shares held at any given time by each stockholder. Subscriptions to stock and payments thereon are shown preferably in a **subscription ledger.** The great majority of entries in the stock ledger consist of transfers of stock from one stockholder to another—a matter of no significance from the accounting point of view. The stock ledger affords legal evidence of stock ownership, showing stockholder's name and address, number of shares held by him, whether issued originally or subsequently transferred, and current balance to his credit. It shows numbers of certificates issued to each stockholder, number transferred, and date of the transaction. **Postings** to the stock ledger are made from the **stock certificate book;** but transfers may be posted from the **transfer book** or **transfer register.** Where both preferred and common stock exist a separate stock ledger should be kept for each class of stock. The stock ledger may be made **self-balancing** by

JOHN H. KIRCHER, 250 Washington St., Boston, Mass.

Form 1a. Capital Stock Ledger

opening a Capital Stock account on the front page, debiting it with aggregate amount of stock outstanding.

STOCK LEDGER FORM.—Main object of stock ledger is to show **number of shares** standing in a stockholder's name at any time. In **one form** of stock ledger, stockholder's account is debited for stock purchased and credited for stock sold. In the **other form,** stockholder's account is credited for stock purchased and debited for stock sold, as shown in Form 1a. Since the general Ledger Capital Stock account is credited for stock issues, better practice is to credit stockholders' accounts for their purchases of stock. Form 1b shows stock ledger form prescribed by New York Tax Commission.

Hill River Copper Company

Date	Serial No. of Canceled Certificate	No. of Shares	By Whom Surrendered	To Whom Issued	Serial No. of New Certificate	No. of Shares
....	....	....	....	....	....	....
....	....	....	....	....	....	....
....	....	....	....	....	....	....
....	....	....	....	....	....	....

FORM 1b. Capital Stock Ledger (New York Form Prescribed by Tax Commission)

Both **stock ledger** and **certificate book** should be treated as parts of general system of accounts, to avoid difficulties in reconciling Capital Stock account and stock ledger. This is especially true where number of stockholders is large. Problem of reconciliation disappears when all authorized stock has been issued; but tests should be made each month to determine that no errors have been made in transferring stock from one account to another. This can be done by making a schedule of outstanding stock and seeing that its total agrees with the Capital Stock account.

In making **transfers of stock** care must be taken in case a stockholder desires to transfer part of his shares. His original certificate should be canceled and two new ones issued, one in favor of transferee for number of shares transferred and one in favor of transferor for number remaining in his ownership. Lack of attention to these details is the cause of much trouble. When a stockholder surrenders one certificate for two or more of smaller denomination it is a split. The surrender of two or more smaller certificates for one larger is also a **split.**

When transfers are made frequently, a **transfer register** or **journal** should be used as a posting medium to the stock ledger. Each transfer involves a charge to transferor and a credit to transferee. Where transfers are infrequent, postings may be made from the **transfer book** or even the **stock certificate book.**

ACCOUNTING FOR STOCK SUBSCRIPTIONS.—Stock certificates should not be issued to subscribers until they are paid in full. Until the subscribers pay in full their accounts are in the nature of accounts receivable. Procedure is illustrated as follows:

The Atwater-Lawson Company, incorporated under the laws of Massachusetts, with an authorized capital stock of $200,000, receives subscriptions to $150,000 of stock at time of organization. The entries to show stock authorized and subscriptions to $150,000 thereof are:

Unissued Capital Stock	$200,000	
Authorized Capital Stock		$200,000
Subscriptions	$150,000	
Capital Stock Subscribed		$150,000

For subscriptions, at par, to 1,500 shares, by the following incorporators:

A. J. Ramsdell	700 shares
L. L. Atkins	400 "
S. T. Jordan	200 "
J. R. Morton	200 "

Ramsdell and Atkins pay their subscriptions immediately in full cash, Jordan pays his by transferring merchandise valued at $20,000, but Morton pays nothing at present. The following entries are in order:

Cash	$110,000	
Subscriptions		$110,000

For payments of subscriptions, as follows:

A. J. Ramsdell	700 shares
L. L. Atkins	400 "

Merchandise	$ 20,000	
Subscriptions		$ 20,000

For transfer of merchandise by S. T. Jordan in full payment of his subscription.

Capital Stock Subscribed	$130,000	
Unissued Capital Stock		$130,000

For stock certificates Nos. 1, 2, and 3 issued to subscribers having paid their subscriptions in full.

The **Subscriptions** and **Capital Stock Subscribed** accounts are outlined below:

Subscriptions

Debit: For amount of subscriptions to capital stock.	**Credit:** For cash or property paid on subscriptions; or for amount of each instalment as it falls due; also for unpaid balances of subscriptions canceled.

Capital Stock Subscribed

Debit: For par of stock subscribed and credited to this account, when certificates of stocks are issued for shares paid up, credit being to Capital Stock Unissued. For par of canceled stock subscriptions, having been pre-credited to this account.	**Credit:** For par of capital stock subscribed, debit being to Subscriptions account.

Capital Stock Subscribed account is a suspense account in which subscriptions are entered until certificates are issued, which is ordinarily done when they are paid in full. It shows total original par value of all subscriptions certificates for which have not been issued.

To illustrate, A, B, and C are subscribers to stock of the X Company in amounts of $200, $700, and $1,200, respectively. A has paid in full, B has paid $500, and C nothing. C is to receive his stock for $1,000. Entry for subscription is:

Discount on Stock	$ 200	
Subscriptions	1,900	
Capital Stock Subscribed		$2,100
(*Full explanation.*)		
Cash	$ 700	
Subscriptions		$ 700

When A's stock is issued:

Capital Stock Subscribed	$ 200	
Capital Stock Unissued		$ 200
(*Full explanation.*)		

The Capital Stock Subscribed account now stands credited with $1,900, this being amount subscribed but not as yet fully paid. Sometimes stock subscribed on the instalment plan is credited directly to Capital Stock account; but the above method is ordinarily preferable.

Subscriptions Ledger.—Where subscriptions are numerous and are paid in instalments, a **subscriptions ledger** should be kept. This is controlled by the **Subscriptions account** in the general ledger. In it is kept an account with each subscriber. This account is debited with the amount of his subscription and credited with amounts paid thereon. A trial balance should be taken monthly to ascertain that the subscription ledger agrees with controlling account. For this ledger any form of small ledger sheet, bound book or card system, is suitable. For debits, show date, subscription number, number of shares subscribed, journal folio from which posted, and amount. For credits, show date, receipt number, cash book folio from which posted, and amount.

Subscription Cancellation.—Cancellations of subscriptions are sometimes permitted. If so, and no payment thereon has been made, entry is:

Capital Stock Subscribed	$2,000	
Subscriptions		$2,000
To cancel subscription No. 78, of C. J. Astor, for 20 shares.		

If money has been received and it is decided to return it to subscriber, following entries are made in journal and cash book, respectively:

Capital Stock Subscribed	$1,500	
Subscriptions		$1,500
To cancel unpaid balance of subscription No. 78, of C. J. Astor, for 20 shares.		
Capital Stock Subscribed	$ 500	
Cash		$ 500
To refund payment by C. J. Davis, on subscription No. 78, for 20 shares.		

If the company retains, say, 20% of amount paid in, entry is:

Capital Stock Subscribed	$500	
Cash		$400
Profit on Forfeited Subscriptions		100
To refund 80% of payment by C. J. Davis, on subscription No. 78, for 20 shares.		

Stock Sales After Organization.—Entry is same as if made at time of incorporation.

Transfers of Subscriptions.—These are sometimes permitted, whether or not fully paid. If numerous, provide a **subscriptions transfer journal** similar to stock transfer journal. Amount of unpaid balance is credited to transferor on subscription ledger and debited to transferee.

Other Books Used.—In case of large companies a **subscriptions journal** should be used. It shows date, subscription number, name and address of subscriber, number and kind of shares of stock subscribed, amount to be paid thereon, name of salesman, if any, and his commission. Each month following entry is made in journal for the total month's subscription:

Subscriptions	$...	
Capital Stock Subscribed		$...

Amounts receivable on subscriptions are posted to the **subscriptions ledger,** an account being opened for each subscriber. This ledger must agree with the controlling Subscriptions account in the general ledger.

Payments on subscriptions are entered in cash book in a **receipts from subscriptions column,** from which total is posted monthly to general ledger, whereas details are posted to the subscriptions ledger.

When a **certificate** representing stock previously unissued is issued, **number of shares** and **certificate number** are posted from certificate stub to stock ledger. At end of month total number of shares thus issued is represented in following journal entry:

Capital Stock Subscribed	$...	
Capital Stock Unissued		$...

Transfers from owner to owner do not require a general journal entry, but only in the **transfer register,** whence they are posted to the stock ledger accounts of transferor and transferee.

Stock subscription transfers are entered in **subscriptions transfer journal** or in **unissued** column of **transfer register** the same as transfers of certificates. Name of subscriber to whom transferred, subscriptions number, and number of shares should be recorded. These transfers are posted to the **subscriptions ledger.**

Stock subscription cancellations, no payment having been made, are indicated by a **red ink entry** on subscriptions journal giving same information as at time subscription was entered. It indicates a deduction and is posted to credit of subscriptions ledger.

An instalment book is employed when stock is to be paid on instalment plan. (See Form 2.) A new page is made out for each instalment. Instead of rewriting the names each time, short pages may be used after the first. Consider the instalment book a **subsidiary ledger** to the **Instalment account.** Number in first column indicates folio of subscriptions ledger in which subscriber's account is recorded. Figure in last column preceding "remarks" column indicates cash book folio to which payments should be carried each day in total, being credited to Instalment account. An Instalment account should be opened in general ledger and charged to aggregate amount of subscriptions

Lancaster Cement Company

Instalment No. 1—10%—Payable June 2, 1922

Shdrs' L. F.	Subscriber's Name	Address	Number of Shares	Amount of Instalment	When Paid	Amount Received	C. B. Fol.	Remarks
25	Ronald Logan	627 Warren Ave., Lancaster, Pa.	1,000	$10,000	June 2	$10,000	......	....
7	Samuel Bennett	4425 Spruce St., Philadelphia, Pa.	1,000	10,000	June 2	10,000	......	....
40	A. W. Thompson	Lancaster, Pa.	1,000	10,000	June 2	5,000	......	Balance in 4 days
12	J. H. Connor	Harrisburg, Pa.	1,000	10,000	....	....	......	Will pay on the 6th
16	O. K. Ferguson	1420 Arch St., Philadelphia, Pa.	1,000	10,000	June 2	10,000	......	....

FORM 2. Instalment Book for Stock Subscriptions

due at that date. It is desirable to carry each day's total receipts to the cash book instead of waiting until all are paid, because it is unlikely that all instalments will be paid as they fall due. Data for compilation of the instalment book is secured from the subscriptions ledger. The instalment book may be bound or loose-leaf, the latter ordinarily being preferable. When subscribers are few in number, the instalment book may be dispensed with, in which case cash received on instalments is entered directly in cash book and posted therefrom to subscribers' accounts in subscriptions ledger. Totals are carried to general Subscriptions controlling account.

An **outline** of the general ledger **Instalment account** is as follows:

Instalment Account

Debit: For instalment due, corresponding credit being to Subscriptions account.	**Credit:** For amounts paid on instalments due.

The Instalment account is opened each time an instalment falls due, and closed when all payments have been made thereon. It should be used only when the amount of stock subscribed is considerable. Each time it is opened, the number and per cent of total subscription represented should be indicated, as, "Instalment No. 1, 20%." To ascertain total due on subscriptions, balance of Instalment account, if any, should be added to balance of the Subscriptions account. When Subscriptions controlling account is credited to offset charge made to Instalment account, individual subscribers' accounts in subscription ledger must also be credited. When subscribers pay, credit Instalment account for total and in detail in the Instalment book.

To illustrate, Johnson Manufacturing Co. is organized Mar. 1, 19—, capital stock $500,000, subscribed thus:

Dugald Stewart	500 shares
T. D. Hanover	500 "
L. K. Smith	500 "
J. D. Orton	500 "

Terms are 40% down and balance in two equal instalments. The entries are:

Mar. 1, 19—

(1) Capital Stock Unissued	$500,000	
Capital Stock Authorized		$500,000
(2) Subscriptions	$500,000	
Capital Stock Subscribed		$500,000
The Johnson Manufacturing Co. is organized this date with an authorized capital stock of $500,000, there being 5,000 shares of a par value of $100 each, the total of which is subscribed as per following list. Terms are 40% down and balance in two equal instalments due, respectively, Apr. 1 and May 1, 19—.		
(3) Instalment No. 1	$200,000	
Subscriptions		$200,000
For first instalment (40%) due on date of incorporation.		

(4) Cash	$200,000	
Instalment No. 1		$200,000
For payment of first instalment of 40%.		
Apr. 1, 19—		
(5) Instalment No. 2	$150,000	
Subscriptions		$150,000
For second instalment (30%) due on Apr. 1, 19—.		
(6) Cash	$150,000	
Instalment No. 2		$150,000
For payment of second instalment (30%) due Apr. 1, 19—.		
May 1, 19—.		
(7) Instalment No. 3	$150,000	
Subscriptions		$150,000
For third instalment (30%) due on May 1, 19—.		
(8) Cash	$150,000	
Instalment No. 3		$150,000
For payment of third instalment (30%) due May 1, 19—.		

STOCK SOLD BELOW PAR.—Original issues are sometimes sold below par, the laws of some states specifically permitting this. Unless some such statutory provision exists and is followed, so long as the stock stays in hands of purchasers or of those who purchase it in turn with a knowledge of facts, the liability for the unpaid part attaches. Discount is not the same as a commission, however; the latter being a legitimate deduction, no liability accrues.

Illustration.—The James Hardware Co. is organized under laws of State of Maryland, July 22, 19—, authorized capital stock, $200,000. At date of organization stock having a par value of $50,000 is sold to Martin Lawrence at a discount of 20%. The entry is:

(1) Cash	$40,000	
Discount on Capital Stock	10,000	
Capital Stock Subscribed		$50,000
(2) Capital Stock Subscribed	$50,000	
Unissued Capital Stock		$50,000

The outline of the discount on Capital Stock account is:

Discount on Capital Stock

Debit	Credit
Debit: For amount of discount on capital stock sold below par.	**Credit:** For amount amortized, against surplus or otherwise.

Discount on capital stock should be regarded as either a capital loss or as a developmental cost. If a loss, it should be charged to Surplus. If a developmental cost, it should be capitalized by charging to some fixed asset account, such as **Cost of Development.**

STOCK SOLD ABOVE PAR.—When stock is sold at a premium, credit proceeds in excess of par to a **Premium** account or to **Capital Surplus.** If held in a Premium account this should be regarded as a classification of surplus.

Where there are both discounts and premiums resulting from sales of stock, the net balance of the two accounts should ultimately find its way to Surplus.

Illustration.—The Lewiston Manufacturing Co. sells stock with a par value of $100,000 at a premium of 20%, for cash. The entry is:

Cash	$120,000	
Unissued Capital Stock		$100,000
Premium on Capital Stock		20,000
For stock sold to provide for extensions and betterments.		

NO-PAR STOCK.—No-par stock should be entered on books at sale price, and should not be given a nominal value. If authorities insist on employing a nominal value, excess or deficiency of sale price above or below this nominal value should be carried to a Capital Surplus or Deficit account, as the case may be. In general the principles governing book entries for no-par stock are the same as those for par value stock. In accounting for no-par stock there is no need of Capital Stock Authorized and Capital Stock Unissued accounts.

Opening Entries for No-Par Stock.—A pro forma statement is necessary, since it is impossible to indicate authorized capital stock by means of a journal entry. The opening journal entry should show the subscriptions first received.

Illustration.—The Atkins Wholesale Co. was incorporated Apr. 1, 19—, with an authorized capital of 200,000 shares without par value. At time of incorporation 100,000 shares were subscribed at $30 per share, one-half payable immediately in cash and balance July 1. Entries are as follows:

Apr. 1, 19—		
Subscriptions	$3,000,000	
Capital Stock Subscribed		$3,000,000
The Atkins Wholesale Co. is this day organized with an authorized capital stock of 200,000 shares, no-par value stock. Subscriptions are received for 100,000 shares at $30 per share, one-half payable this day and one-half July 1.		
Cash	$1,500,000	
Subscriptions		$1,500,000
(*Full explanation.*)		
July 1, 19—		
Cash	$1,500,000	
Subscriptions		$1,500,000
(*Full explanation.*)		
Capital Stock Subscribed	$3,000,000	
Capital Stock		$3,000,000
For certificates Nos. .... issued to .... for subscription paid in full.		

No-Par Stock Records.—Same records are used as in case of par-value stock. Corporations having no-par stock are not able to tell number of shares outstanding by subtracting debit balance of **Unissued Capital Stock account** from credit balance of **Capital Stock Authorized Account,** and dividing difference by par value of stock. To determine how many shares Capital Stock account represents, it is necessary to trace back individual transactions, unless details thereof are shown in ledger account in addition to money value. This may be done as per following illustration:

Capital Stock

	19— July 1, 100,000 shares at $30.... $3,000,000.

Surplus.—In case of corporations having no-par stock net profits should be carried to Surplus as is done when there is par-value stock, and earned surplus should be distinguished from capital surplus. The need of differentiating between capital stock and surplus in case no-par stock is employed is an accepted principle.

Book Value = (Capital + Surplus) ÷ Number of Shares Outstanding

No-Par Preferred Stock.—No-par preferred is given a **declared value** more frequently than is no-par common, because if it is given a preference as to assets, amount applicable to each share must be indicated. It need not be carried in books at this value.

Par preferred and no-par common sometimes exists in combination in same corporation. In this case the usual rules apply to each regardless of existence of other kind of stock.

To illustrate, The Arlington-Smith Co. is incorporated with a capital of 20,000 shares no-par common stock and 15,000 shares preferred, having a par value of $100 each. Of these, 10,000 shares of common are sold for $40 each, and 5,000 shares of preferred at par. The additional 10,000 shares of common are issued in payment for real estate valued at $339,500. The entries are:

Cash..	$400,000	
Common Stock.........................		$400,000
For payment in full of 10,000 shares of common stock, this being one-half of total amount of common stock authorized.		
Cash..	$500,000	
Preferred Stock.........................		$500,000
For payment in full in cash of 5,000 shares of preferred stock.		
Real Estate....................................	$339,500	
Common Stock.........................		$339,500
For purchase of real estate, in payment for which 10,000 shares of no-par common stock are issued.		

Change from Par to No-Par Stock.—This may be illustrated as follows: Company A has outstanding common stock amounting to $500,000, par value per share $100. It also has a surplus of $200,000, $50,000 of which is capital surplus resulting from sale of stock at a premium. Charter is changed to authorize an issue of 10,000 shares of no-par stock. Of these, 5,000 shares are to be issued pro rata to present stockholders. Entry, first plan:

Capital Stock..................................	$500,000	
Surplus..	50,000	
Capital Stock.........................		$550,000
For exchange of par stock for no-par stock on a pro rata basis, as per amended charter. (See minute book, p. ....) Surplus derived from sale of stock is canceled, credit being to new		

Capital Stock account. Old Capital Stock account is closed, credit being likewise to new Capital Stock account

If the theory that the surplus derived from sale of original stock at a premium does not enter into valuation of stock is adhered to, the entry is:

Capital Stock..................................	$500,000	
Capital Stock..........................		$500,000
To record cancellation of old Capital Stock account and issue of new no-par Stock; as per amended charter. (See minute book, p. ....)		

If the theory is followed that book value of old stock should be basis for valuation of no-par stock, following is the necessary entry:

Capital Stock..................................	$500,000	
Surplus..	200,000	
Capital Stock..........................		$700,000
(Full explanation.)		

No-Par Treasury Stock.—If no-par stock is repurchased above original sale price, excess represents a reduction of surplus, and should be charged to Surplus. If repurchased at less than original sale price, difference may be credited to **Contingent Profit on Treasury Stock,** or be regarded as paid-in surplus, charge to Treasury Stock account being at original sale price. Where stock was originally sold at various prices some prefer to charge Treasury Stock at an average of these various prices. Later sales of stock might make this average somewhat meaningless. In case of **donated no-par stock,** best practice is to make a memorandum entry, thus:

Donated Stock..................................	$.......	
Capital Stock..........................		$.......
For donation of 500 shares for working capital.		

When donated stock is sold, charge Cash and credit Donated Surplus. If intangibles are received in payment for original issue, conservative practice is to credit proceeds of sale of donated stock to asset account representing intangibles.

No-Par Stock Legislation.—In New York a committee of the State Bar Association, in 1892, suggested no-par stock. In 1907, the Bar Association committee devised a bill which was passed by the New York legislature the same year. This was vetoed. Same bill, changed somewhat, was again passed Apr. 15, 1912, since when it has been in effect. Following states have passed no-par stock legislation:

1916 Maryland
1917 California, Delaware, and Maine
1918 Virginia
1919 Illinois, Pennsylvania, New Hampshire, Ohio, Wisconsin, and Alabama
1920 Massachusetts, New Jersey, Rhode Island, and West Virginia
1921 Colorado, Idaho, Kansas, Michigan, Missouri, North Carolina, and Utah
1922 Georgia and Arizona
1923 Washington

Following are among the corporations which have adopted no-par stock: Kennecott Copper, Columbia Graphophone, Consolidated Textile, Cuba

Cane Sugar, General Motors Corp., Otis Elevator, Loew's, Inc., Radio Corp. of America, Sinclair Consolidated Oil Corp., United States Stores, Vanadium Corp., and Wilson & Co., Inc.

Thomas Conyngton gives **characteristics of laws** authorizing no-par stock as follows:[1]

1. Authorization may be secured upon organization by charter provision, or by amendment of existing charter. Latter method facilitates reorganization.
2. The privilege is generally limited to what are termed in New York **business corporations,** i.e., those organized for mining, manufacturing, and mercantile ventures.
3. The statutes provide that in all cases such shares shall be equal in all respects.
4. These **equal rights and privileges** are: each share entitles holder to one vote for each share held; to notice of corporate meetings; to inspection of corporate books; to participate proportionately in dividends after preferred dividends are paid; and to share proportionately in surplus after debts are paid and after preferred stockholders have been paid their principal and accumulated dividends.
5. **Certificates of shares** with no par value must give number of shares to which holder is entitled and should give whole number of shares authorized to be issued. As shares have no par value, holder should be informed as to his proportionate holding. In New York this information must be given but it is not compulsory in other states.
6. All states prescribe a method of fixing a **selling price,** but there is a diversity of methods. May be prescribed in charter. This is objectionable, because an advantage of stock without par value is that corporation may sell it at any price. Any change in price would require an amendment of the charter.

SUNDRY CONSIDERATIONS.— Frequently capital stock is issued in payment for **organization expenses.** This may be gradually written off or permanently capitalized. The former plan is ordinarily the better one. For this purpose five years is often regarded as a suitable period, one-fifth being charged off each year.

Commissions to bankers and syndicates who market the capital stock of a corporation are sometimes paid in capital stock. If paid by an original issue of stock the charge should be to **Commission** or to **Organization Expense,** and the credit to **Capital Stock** or **Unissued Capital Stock,** according to method adopted to handle capital stock. Sometimes commissions are paid in **treasury stock** or in **donated stock,** in which case the one or other of these accounts is credited.

Sometimes **salaries** are paid in capital stock. The stock is ordinarily issued only once a year in payment, although the accruing liability should be shown monthly by a charge to Salaries and a credit to Salaries Accrued, to a Subscriptions to Stock account, or to the individual. When stock is issued, charge Salaries Accrued, Capital Stock Subscribed, or the individual, and credit Capital Stock, Unissued Capital Stock, or Treasury Stock, according to the particular method followed.

Any debt may be paid in capital stock, so long as rules governing issuance of stock are observed. When paid in no-par stock, amount to be credited to Capital Stock account is amount of debt canceled.

The term **treasury stock** applies only to stock of issuing corporation donated back or repurchased. Stocks of other corporations purchased constitute **investments** and should be carried at cost; unless buying and selling stocks is the business of company, in which case cost or market, whichever is lower, may be used as basis. If purchased to secure control, considerations applicable to **holding companies** apply.

To illustrate, The Alexander-Johnston Co. buys $100,000 par value of stock of the Smithson-Jones Co. at $80 per share. Later it disposes of $50,000 par value of this stock at $90 per share. Entries are:

[1] *Administration*, Jan. 1921, pp. 91–92.

Stock of Other Companies	$80,000	
Cash		$80,000
For purchase of $100,000 par value of the stock of Smithson-Jones Co. at 80.		
Cash	$45,000	
Stocks of Other Companies		$45,000
For sale of $50,000 par value of stock of the Smithson-Jones Co. at 90.		

If laws permit, purchase of stock of other companies may be made by issuing stock of purchasing company in payment.

Bonuses may be paid in stock, either unissued or treasury. They are sometimes given to employees as an additional compensation, and are sometimes given in connection with bond sales or sales of a different class of stock. Charge **Bonus** and credit **Donated Stock** or **Capital Stock.** Disposition of the charge to Bonus accounts will depend on the nature of the transaction.

Dividends

NATURE AND PAYMENT OF DIVIDENDS.—Ordinarily dividends are declared from **net profits** of a corporation. Once legally and publicly declared, they cannot be rescinded, but become the direct liability of the company. As soon as declared, an entry should be made on the books expressing this liability. **Cumulative dividends** do not become such an obligation until declared. The **Dividends Payable account** is used to express this liability, **Surplus** being charged.

The Oliver Mining Company
Capital Outstanding $400,000

Dividend No. 24 Sheet No. 48

List of stockholders of this company as shown by the transfer books at the closing thereof at six o'clock p.m., Feb. 15, 19—, and to whom the dividend of Ten Per Cent, declared Feb. 12, 19—, is payable on Mar. 1, 19—.

Shares outstanding 40,000 Rate of dividend 10%

Name of Stockholder	To Whose Order Check Should be Drawn if Different from that of Stockholder	Mailing Address	Number of Shares	Amount of Dividend Paid	No. of Check Issued in Payment
....	....	....	....	....	....
....	....	....	....	....	....
....	....	....	....	....	....

Form 3. Dividend Book—Payment by Mail

If the stockholders are few in number, **dividend checks** may be drawn against the general bank account. At time of payment, Dividends Payable account is charged and Cash credited. The larger corporations, after determining the amount of a dividend, draw one check for the total, deposit this in a special

Hillsport Manufacturing Company
Semiannual Dividend No. 24..........19.. 4%

Name of Stockholder	Address	Number of Shares	Amount of Dividend	We Hereby Acknowledge Receipt of the Accompanying Dividend
....	....	....	....	....
....	....	....	....	....
....	....	....	....	....

FORM 4. Dividend Book—Personal Payment

bank account, and then draw the **individual dividend checks** against this account. Balance in this account at any time indicates total amount of outstanding dividend checks. **Specially printed dividend checks** may be used. These give date and number of dividend. An **addressing machine** is used to stamp name and address of stockholder in lower left-hand corner, and amount is filled by means of a typewriter or printing machine. After being signed by proper official, they are mailed in **window envelopes.**

The **dividend book** (Form 3) is used to show names of stockholders, dividend date, amount of checks, etc. The list is made up from the stock ledger for each dividend declared. To accomplish this it is frequently customary to close the **transfer books.** Loose-leaf dividend books are customary in case of large corporations. Where stock is closely held and stockholders call at company's office for their dividend checks, Form 4 may be used.

Illustration.—The Hanover Corp. has net profits of $3,127,528.13 for the year ended Dec. 31, 19—. On Jan. 22 the directors declared a cash dividend No. 13, of 5%, on the $20,000,000 outstanding stock, payable quarterly, Mar. 1, June 1, Sept. 1, and Dec. 1. Entries are:

Dec. 31, 19—		
Profit and Loss..................	$3,127,528.13	
Surplus......................		$3,127,528.13
To carry net profits for year ended Dec. 31, 19—, to Surplus.		
Jan. 22, 19—		
Surplus............................	$1,000,000.00	
Dividend Payable No. 13........		$1,000,000.00
To show liability for dividend of 5% on outstanding stock, declared today by the Board of Directors and payable quarterly, Mar. 1, June 1, Sept. 1, Dec. 1, 19—.		
Mar. 1, 19—		
Dividend Payable No. 13..............	$ 250,000.00	
Cash.........................		$ 250,000.00
For first quarterly payment of dividend No. 13.		

Entries for June 1, Sept. 1, and Dec. 1, are similar to the last entry above.

Dividends on no-par stock are expressed as amounts of money per share, not as a per cent per share. Otherwise procedure is same as in case of par-value stock.

SPECIAL FORMS OF DIVIDENDS.—A **scrip dividend** is one paid by promissory note owing to temporary shortage of cash. It usually bears interest and is given a definite due date. The scrip is a **certificate** which contains company's promise to pay and all details necessary to make it a proper form of contract. They are frequently transferable, and may be convertible into the company's stock. When the dividend is paid, **Scrip** instead of **Cash** is credited. Later when the scrip is paid, **Cash** is credited and **Scrip** and **Interest** are charged.

Special (including **interim**) **dividends** are sometimes declared additional to the regular dividend. They are ordinarily declared only when justified by extraordinary profits.

Dividends may be set off against stock subscriptions, providing the debt is due when the dividend is payable. This is accomplished by charging **Dividend Payable account** and crediting **Instalment account,** instead of **Cash.**

Cumulative dividends passed require no formal entry because they do not become debts until declared. The contingent liability therefore should be shown in a footnote to the balance sheet.

Stock dividends are dividends payable in the company's own stock. Unissued, purchased, treasury, or donated stock may be used for this purpose, but sufficient surplus must exist from which to make the distribution. The entry is the same as for a cash dividend except that **Capital Stock** is credited instead of cash when the dividend is paid. If the dividend is paid in **no-par stock,** the amount of surplus is not affected, unless each share is given an arbitrary valuation. The stockholders' interest is merely split up into more shares. Entries for stock dividends paid in par value stock are:

Surplus..	$.....	
Dividend No. 6....................................		$.....
To show liability for dividend of 15% on outstanding stock, declared this day by the Board of Directors.		
Dividend No. 6..	$.....	
Capital Stock..		$.....
To show issue of stock in payment of dividend No. 6.		

Dividends are sometimes paid in assets other than cash, as property or bonds of other companies, providing sufficient profits exist. In this case the charge is to Surplus and the credit to the property account in question.

Accounting for Bond Issue

DEFINITIONS.—A **bond** is a written promise, under seal, to pay a sum of money at a specified time. Bonds are **registered** and **coupon,** but coupon bonds may be registered as to principal. In case of bonds registered as to interest the interest is paid by check. In case of coupon bonds the interest is secured by cutting off the coupons as they fall due and cashing them. All bonds of a given issue usually bear the same date. If one or more coupons mature before a bond is sold, these are clipped off and pasted in the **coupon register.** Of an **authorized issue** the total or less may be outstanding at any time. Thus of an authorized issue of $15,000,000 Union Bag & Paper Corp. First Mortgage Gold 6's, dated May 1, 1922, there were outstanding $6,500,000 in Oct., 1922. To the amount authorized but not issued the term **treasury bonds** is sometimes applied, but some accountants apply this term only to

FORM 6. Index of Bondholders

bonds which have been outstanding and have come again into possession of the company.

Nominally issued bonds are those which have been certified by trustees and placed with proper officer for sale and delivery; or pledged, or placed in some special fund of the accounting company.

Actually issued bonds are those sold to a bona fide purchaser.

ACCOUNTING RECORDS.—Method of disposal of bonds determines what records are essential. If corporation sells bonds direct, treasurer must keep a full record. If sold through a syndicate or trust company, much detail of recording, transfers, etc., is taken care of by the syndicate or trust company.

A coupon register is necessary if coupon bonds are issued (Form 5). **An index of bondholders** should be kept in card index form (Form 6).

The **bond register** (Forms 7a, 7b) provides space for name and address of holder, number of his bond, date acquired, name of transferee, and columns for interest payments. In case of a 10-year bond, interest payable semiannually, 20 columns are necessary. When a **registered bond** is transferred, old bond is canceled and a new one is issued in its place. Surrendered bond is canceled and filed. In **bond register** a **red-ink line** is ruled through **name and address** of former owner, also through **number and amount** of canceled bond. Number of new bond is written directly after last entry of interest payment on old bond. A line should be ruled through remaining interest columns. Next, name and address of new holder is recorded on first vacant line of register in "to whom issued" column. Bonds should be entered in **numerical order** to make location of any specified bond easy. Number of page of bond register on which a given bond is registered should be entered on index of bondholders. Difference between footings of amount column of bond register and total bonds canceled should agree with general ledger **Bond account balance.** When interest on bonds is paid by check, Interest is charged and Accrued Interest credited monthly in general ledger. When interest is paid, Cash is credited and Accrued Interest charged. In case of registered coupon bonds, interest columns are omitted from the register, and bonds are entered as presented, not numerically, as are registered bonds. One page of **coupon register** should be used for each bond, spaces being numbered to correspond with coupon numbers.

BOND ACCOUNTS.—If a formal entry is desired to show total authorized bond issue, credit **Bonds Authorized** and charge **Unissued Bonds** for par value of the bonds authorized. If in series, open separate accounts for each series. Each issue should be given a distinguishing title, as, "Ten-Year Gold 8's," "Convertible Debenture Gold 6's," "Fifteen-Year 7% Equipment Trust Certificates," etc. If undesirable to show bonds authorized in a formal account, a **Bond** account should be credited with par of bonds actually issued. Failure to indicate in some way amount authorized is a failure to indicate the true amount for which property subject to the bond mortgage may be mortgaged in case of future sales of bonds.

Bond Premium and **Bond Discount** accounts are employed, respectively, when bonds are sold above or below par.

To illustrate, A $100,000 issue of 20-year first mortgage 6% bonds is sold at a premium of 10. The entry is:

Cash	$110,000	
First Mortgage 6% Bonds		$100,000
Premium on Bonds		10,000
For sale of $100,000 20-year first mortgage 6% bonds at a premium of 10.

FORM 7b. Bond Register (right-hand page)

A $100,000 issue of 20-year first mortgage 6% bonds is sold at a discount of 10. The entry is:

Cash	$ 90,000	
Discount on Bonds	10,000	
First Mortgage 6% Bonds		$100,000
For sale of $100,000 20-year first mortgage 6% bonds at a discount of 10.		

See section on "Mathematics" for principles governing accumulation of bond discount and amortization of bond premium.

Interest on Bonds account should be charged each month or fiscal period with interest on bonds applicable to the month or fiscal period, **Accrued Interest on Bonds account** being credited. When interest is paid, **Cash** is credited and **Accrued Interest on Bonds** is charged.

Bonds bear interest from **date of issue.** If sold at a subsequent date, interest accumulated but not due must be accounted for. This the purchaser buys by adding it to the purchase price of the bonds.

To illustrate, $500,000 of 5% bonds are sold at par one month after date of issue. Entry is:

Cash	$502,083.33	
Bonds		$500,000.00
Interest on Bonds		2,083.33
For sale of $500,000 of bonds with interest accrued for month at 5%.		

The purchaser loses interest on interest thus bought for period between date of purchase and next interest due date, in above illustration 5 months.

Bond subscriptions may be paid for in **instalments.** In this case **Bond Subscriptions** should be charged and **Unissued Bonds** credited at time of subscription. As instalments are paid, **Bond Subscriptions** is credited and **instalment receipts** issued. When all instalments are paid the receipts are exchanged for the bonds. **Deferred instalments** may be made to bear interest at rate paid on bonds. This, when received, is a credit to **Bond Interest.**

When bonds are sold through **bankers,** the bankers are charged with total issue and credited as payments are made by them.

To illustrate, James & Allison, investment bankers, guarantee purchase of an issue of $500,000 first mortgage bonds at 98. Entry at time contract is signed is:

James & Allison, Bankers	$490,000	
Discount on Bonds	10,000	
First Mortgage Bonds		$500,000

When a payment of $300,000 is received:

Cash	$300,000	
James & Allison, Bankers		$300,000

Bonds **guaranteed** as to interest constitute a contingent liability on books of guaranteeing company. If guaranteeing company is compelled to pay this interest through default of principal debtor, defaulting company is charged therefor on books of guaranteeing company, and on books of defaulting company guaranteeing company is credited.

Collateral trust bonds are secured by a deposit of stocks or bonds, or both, of other corporations. The North American Edison Co. Secured Sinking

Fund Gold 6's, Series "A," dated Mar. 15, 1922, and due Mar. 15, 1952, are secured by a pledge of 72.7% of outstanding common stock of the Cleveland Electric Illuminating Co. and the entire outstanding common stock of the Union Electric Light & Power Co. of St. Louis. Collateral must be turned over to trustee before bonds are sold. At time of transfer charge **Pledged Investments** and credit **Investments** or other equivalent accounts, giving full explanatory details. If more than one collateral issue is outstanding, separate accounts should be kept for pledged collateral applicable to each.

Equipment trust bonds are usually redeemable in series, one each year. Such bonds are secured by equipment upon which lessee usually makes an initial payment. As each series is paid, an entry is made on books of lessee charging Equity in Leased Equipment and crediting Leased Equipment.

To illustrate, Spring Valley Railroad Co. issues equipment trust 5% bonds, dated June 1, 1922, for $5,000,000 payable in 10 yearly instalments of $500,000, beginning June 1, 1923. Security consists of new equipment costing $7,000,000, upon which an initial payment of $2,000,000 is made by the railroad company. Equipment is purchased through agency of Carlton & Hayes, bankers, who also market the bonds, guaranteeing a return of 100 to the company. Expenses of issue amount to $10,000. Entries are:

June 1, 1922		
Equity in Leased Equipment................	$2,000,000	
Cash.............................		$2,000,000
Initial payment on following equipment. *(Give list and details.)*		
Leased Equipment.........................	$5,000,000	
Equipment Trust Bonds..............		$5,000,000
For issue of equipment trust bonds maturing $500,000 each year.		
Expense—Equipment Trust Bond Issue.......	$ 10,000	
Cash.............................		$ 10,000
June 1, 1923		
Equipment Trust Bonds....................	$ 500,000	
Cash.............................		$ 500,000
Equity in Leased Equipment................	$ 500,000	
Leased Equipment..................		$ 500,000

INTEREST ON BONDS.—Ordinarily bond interest is payable from date of issue of bonds. If bonds are registered as to interest, interest is paid by check; otherwise by cashing of coupons. Coupons are ordinarily payable at office of issuing company or its fiscal agent. If a sum is turned over to the company's fiscal agent to enable it to cash coupons as they fall due, an entry is made in the cash book crediting **Cash** and charging **Interest on Bonds.** The money should be sent to the trust company acting as fiscal agent soon enough to enable it to have money in readiness for cashing coupons on due date. The paid and canceled coupons should be returned to issuing corporation to be entered in the **coupon register.**

Accruing bond interest must be taken into consideration at the end of each accounting period. This is accomplished by means of a journal entry charging **Interest** and crediting **Interest Accrued** for the amount applicable to the period When actual payment of interest is made, **Interest Accrued** is charged and **Cash** is credited. It must be remembered that the interest paid is the **nominal**

rate, which may not be the **effective interest cost.** This can be determined only by making proper calculations for effect of discount or premium. (See section on "Mathematics.") Thus if bonds were marketed at a discount and if amount of this to be amortized in one month is, say, \$41.60, whereas interest accrued at nominal rate is \$416.70, then entry is:

Interest	\$458.30	
Interest Accrued		\$416.70
Discount on Bonds		41.60
To charge Interest with interest cost for month, set up liability for interest accrued, and amortize due amount of Discount on Bonds account.		

If above entry is made for each of 6 months constituting an interest period, entry to show payment when interest falls due is:

Interest Accrued	\$2,500.20	
Cash		\$2,500.20
For interest due to-day on bonds.		

If, instead, bonds are sold at premium and amount applicable to month is \$41.60 while nominal interest is \$416.70, entry is:

Interest	\$375.10	
Premium on Bonds	41.60	
Interest Accrued		\$416.70
To charge interest with interest cost for month, set up liability for interest accrued, and amortize due amount of Premium on Bonds account.		

Even though coupons are payable only at office of issuing company, best plan is to draw check for full amount of interest due and deposit as a special account, against which coupons as presented are charged. The amount at any time remaining in this account represents amount of the company's liability on unredeemed coupons. Amounts owing on coupon bonds are a continuing obligation so that the amounts not immediately called for should be kept in readiness for liquidation of overdue coupons. Instead of the term "Interest Accrued" such expressions as "Accrued Bond Interest" and "Accrued Interest Coupons" may be used. Also instead of "Interest Account," "Bond Interest Account" may be employed as being more distinctive.

Checks in payment of interest on registered bonds may be sent either by treasurer of issuing company or by fiscal agent. They should reach payees not later than date on which interest falls due.

Where **two or more bond issues** are outstanding, these must be carefully distinguished in the entries, although if suitable explanations are made it may not be desirable to enter separate journal entries for each issue.

To illustrate, The American Produce Co. on Mar. 1, 19—, issues \$1,000,000 of first and refunding 5% bonds, interest payable Mar. 1 and Sept. 1. On July 1 it issues \$2,000,000 collateral trust 6% bonds, interest payable July 1 and Jan. 1. If monthly entries are made to charge Interest and credit Interest Accrued, entry on June 30 is:

Bond Interest	\$ 4,166.67	
Bond Interest Accrued		\$ 4,166.67
To show interest accrued on \$1,000,000 first and refunding 5% bonds during month of June.		

On July 31 the entry is:

Bond Interest..............................	$14,166.67	
Bond Interest Accrued................		$14,166.67

To show interest accrued during month of June on the following outstanding bond issue:

	Bonds Outstanding	Interest Accrued
1st and ref. 5% bonds........	$1,000,000	$ 4,166.67
Col. Tr. 6% bonds........	2,000,000	10,000.00
	$3,000,000	$14,166.67

Since interest coupons on first and refunding bonds become due on Sept. 1, 19—, following entry is necessary on Aug. 31, 19—:

Bond Interest Accrued..........................	$25,000	
Bond Coupons No. 1.......................		$25,000

For 6 months' interest on $1,000,000 1st and refunding bonds due Sept. 1, 19—.

A similar entry is necessary for interest falling due on the collateral trust bonds, Jan. 1, 19 —. If a check is issued to a fiscal agent to enable him to make payment of coupons due, entry is:

Aug. 31, 19—

Perth Trust Co., Trustee.........................	$25,000	
Cash (or Audited Vouchers).................		$25,000

For amount transferred to meet interest due Sept. 1, 19—, on $1,000,000 1st and refunding 5% bonds.

The liability account "Bond Coupons No. 1" remains a liability until all coupons are redeemed. The trust company renders a monthly report of payments made. If on Sept 30, it reports that $24,500 of No. 1 coupons have been paid, following entry is made:

Bond Coupons No. 1............................	$24,500	
Perth Trust Co., Trustee....................		$24,500

For coupons redeemed by Perth Trust Co., Trustee, during Sept., as per statement submitted.

Treasury bonds are bonds of issuing company acquired by gift or donation. So long as they remain uncanceled, interest thereon is handled in usual manner, total amount required to meet interest on issue being turned over to fiscal agent and coupons being cashed in same manner as on bonds of other companies owned.

Interest paid on **guaranteed bonds** by guaranteeing company should be charged to company whose bonds are guaranteed. At time cash is advanced, credit **Cash** and charge **Advances to Subsidiary Companies.** On books of company whose bond interest is paid, charge **Bond Interest** and credit **Advances from..........Company.**

Interest on **income bonds** is similar to dividends on stock, being paid only if earned. If earnings justify conclusion that it is certain to be paid, monthly entries showing its accrual should be made as soon as declared payable by the board of directors, charging **Interest on Income Bonds.** or, if monthly

accruals have been entered, **Interest Accrued on Income Bonds,** and crediting **Interest Payable on Income Bonds.** When payment is made this account is charged.

DISCOUNT AND PREMIUM ON BONDS.—Bonds usually are issued at a figure above or below par. Consequently the nominal and effective interest rates differ. The **nominal rate** is the percentage of annual interest payment to par of bonds. The **effective rate** is the true interest cost per annum. For a full exposition of principles governing effective interest rate, see section on "Mathematics." **Bond premium** is a deduction from interest. **Bond discount** is an addition to interest. Both must be spread equitably over the life of the bond. This process is known as amortization in the case of bond premium, and accumulation in the case of bond discount. Sometimes companies having large surpluses write off discount on bonds in one sum. This is conservative procedure but not theoretically accurate. Sometimes bond premium is carried to Surplus. This is more objectionable. Chief objection to either practice is that true interest cost of borrowed money is obscured. Correct procedure, in case of **bond discount** or **bond discount and expense,** is to debit a certain part thereof to Interest, simultaneously crediting the Discount account. In case of bond premium, correct procedure is to credit a certain part thereof to Interest, simultaneously charging the Premium account. Principles governing bond amortization and accumulation are explained in section on "Mathematics." Entries are outlined as follows:

Bonds sold at discount, redeemable at par:

At time of sale:

Cash (amount received)...........................	$......	
Discount on Bonds (amount of discount)............	......	
Bonds (par value)........................		$......

At time of periodical interest payment:

Interest (amount of interest plus proportion of discount applicable to current period)..................	$......	
Discount on Bonds (part applicable to current period).............................		$......
Cash................................		....

Bonds sold at premium, redeemable at par:

At time of sale:

Cash (amount received)...........................	$......	
Premium on Bonds (amount of premium)......		$......
Bonds (par value)........................		....

At time of periodical interest payment:

Interest (nominal interest less part of premium applicable to current period)....................	$......	
Premium on Bonds (part applicable to this period)....	....	
Cash (amount paid)......................		$......

Bonds issued at par, redeemable at premium:

At time of sale:

Cash (amount received)...........................	$......	
Bonds (par value)........................		$......

At time of periodical interest payment:

Interest (nominal amount plus part of premium applicable to period)	$......	
Premium on Bonds (part applicable to period)		$......
Cash (amount paid)		......

Bonds sold at discount, redeemable at premium:

At time of sale:

Cash (amount received)	$......	
Bond Premium and Discount (amount of discount)	......	
Bonds (par value)		$......

At time of periodical interest payment:

Interest (nominal interest plus proper part of discount given at time of sale and of premium to be paid when bonds are redeemed)	$......	
Bond Premium and Discount (proper part of discount given at time of sale and of premium to be paid when bonds are redeemed)		$......
Cash (amount paid)		......

When bonds are issued at a discount and redeemable at a premium, the **Bond Discount and Premium** account balance changes from a debit to a credit equivalent at time of redemption to premium to be paid on bonds.

For method of determining actual interest rate see section on "Mathematics." By the **equal instalment method,** the effective rate is ignored and interest actually paid is charged plus a proportionate part, according to term of issue, of discount on issue or premium on redemption, or minus a proportionate part, according to term of issue, of premium received at time of issue.

Equal Instalment Method Illustrated.—The King Manufacturing Co. sells issue of $2,000,000 5% first mortgage bonds at 90 flat. Expenses of issue amount to $10,000. Interest is payable semiannually, so that **bond discount and expense** is $210,000. One-fortieth of $210,000 is $5,250, amount to be amortized to interest each 6-month period. At end of first 6-month period entries are:

Interest on Bonds	$105,250	
Interest Accrued on Bonds		$100,000
Bond Discount and Expense		5,250
For interest accrued, $100,000 on $2,000,000 first mortgage bonds, and to amortize 1/40 of bond discount and expense, being amount applicable to current period.		
Interest Accrued on Bonds	$100,000	
Cash		$100,000
For payment of interest due on $2,000,000 first mortgage bonds.		

Under the **bonds outstanding method,** the premium or discount is distributed over the period during which the bonds are outstanding in the proportion that bonds outstanding each year bear to sum of bonds outstanding for all years. The following table is taken from A. Lowes Dickinson's "Accounting Practice and Procedure" (p. 141).

In practice the buying up of outstanding bonds for sinking fund purposes and the redemption of bonds at irregular intervals are **disturbing factors.** When

Bond Amortization Table

Period ½ Year	Bonds Outstanding	Proportion of Outstanding Bonds to Total Bonds	Amount of Discount Instalment	Interest Payment	Profit on Bond Purchase	Annual charge to Profit and Loss
1	$ 1,000,000	100/1050	$ 11,905	$ 25,000	$ 4,000	$ 32,905
2	950,000	95/1050	11,310	23,750	4,000	31,060
3	900,000	90/1050	10,714	22,500	3,500	29,714
4	850,000	85/1050	10,119	21,250	3,500	27,869
5	800,000	80/1050	9,524	20,000	2,500	27,024
6	750,000	75/1050	8,929	18,750	2,500	25,179
7	700,000	70/1050	8,333	17,500	1,500	24,333
8	650,000	65/1050	7,738	16,250	1,500	22,488
9	600,000	60/1050	7,143	15,000	1,000	21,143
10	550,000	55/1050	6,548	13,750	1,000	19,298
11	500,000	50/1050	5,952	12,500	2,500	15,952
12	450,000	45/1050	5,357	11,250	2,500	14,107
13	400,000	40/1050	4,762	10,000	1,500	13,262
14	350,000	35/1050	4,167	8,750	1,500	11,417
15	300,000	30/1050	3,571	7,500	500	10,571
16	250,000	25/1050	2,976	6,250	500	8,726
17	200,000	20/1050	2,381	5,000	....	7,381
18	150,000	15/1050	1,786	3,750	....	5,536
19	100,000	10/1050	1,190	2,500	....	3,690
20	50,000	5/1050	595	1,250	....	1,845
	$10,500,000		$125,000	$262,500	$34,000	$353,500

bonds are bought in the open market at less than the redemption price specified a saving is made. Although not strictly accurate, this gain may be credited to Profit and Loss, a proportionate part for each of the remaining years the issue is outstanding. When the redemption dates are anticipated, treatment becomes complicated. The **equal instalment method** does not work under these conditions, and if the **effective interest method** is employed it becomes necessary to recompute the rate on basis of bonds remaining outstanding and new redemption terms.

Illustration of Various Methods.—The following illustration of the various methods of bond discount and premium is taken from A. Lowes Dickinson's "Accounting Practice and Procedure" (pp. 136–140):

An issue of $1,000,000 of bonds is made at 90, carrying interest at 5%, and redeemable at the rate of $50,000 each half-year, at 100 for the first 5 years, and thereafter at 105. Calculations made on these premises show that the effective rate of interest is approximately 8 3/16%. Bonds are redeemed each as specified, but they are purchased in the market at the following prices, viz.:

1st year	92	6th year	100
2nd year	93	7th year	102
3rd year	95	8th year	104
4th year	97	9th and 10th drawn at	105
5th year	98		

Methods of Computing Bond Discount and Premium

	(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)
Period ½ Year	Payments for Interest at 5% per annum (a)	Effective Interest charge at 8 3/16% per annum (b)	Discount provided for (2) — (1)	Surplus on purchase at less than redemption price	Charge to Income on effective interest method	Charge to Income on equal annual Instalment Method	Charge to Income when Discount written off on Bonds outstanding method	Charge to Income when Discount charged to Profit and Loss account
1	$25 000 00	$36,843.75	$11,843.75	$4,000.00	$32,843.75	$27,250.00	$32,905.00	$21,000.00

(c)	Extra	{640.61						
			$125,000.00	$34,000.00	$353,500.00	$353,500.00	$353,500.00	$228,500.00
		1/20th	=$6,250.00					

(a) Interest at 2½% for each half-year on $1,000,000, less $50,000 each half-year.
(b) Interest at 4 3/32% for each half-year on $900,000, less $45,000 each half-year.
(c) Balance due to approximation in effective rate.

The table on page 262 gives all the essential figures. In this table, the last four columns show the charges to Income account on the basis (5) of the effective interest method; (6) of the equal instalment method; (7) of the bonds outstanding method; and (8) of charging all discount and premium to surplus; in each case crediting to Income account the surplus arising from purchasing bonds at less than the fixed redemption price.

If the latter be credited direct to Surplus, or carried in the Bond Discount account until all discount has been written off by the operation of these credits and the balance of the effective rate, then at the end of the 11th half-year in the first case and at the end of the 15th half-year in the second, the discount will be extinguished and thereafter only the actual interest paid, less surplus on market purchases, will be charged to Income.

BOND REDEMPTION.—Various arrangements are made by issuing companies for redemption of outstanding bonds. The most popular is the **sinking fund method.** Funds are of two types: (a) those in which the principal only is to be employed for redemption purposes; (b) those in which both principal and interest thereon are to be so employed.

Funds must be distinguished from **reserves.** Funds are assets. Reserves are credits and appear usually on the liability side of the balance sheet; although in case of valuation reserves (which are not reserves of surplus) they are frequently deducted from an asset item in the balance sheet. A **reserve of surplus** is created by a charge to surplus and a credit to a reserve account. This does not mean that a fund is created also. To do this an additional entry, accompanied by a transaction, is necessary. The transaction consists in making an actual transfer of cash to some special account and allowing it to remain there, usually to accumulate at compound interest, or investing it in securities and allowing the principal to increase both by periodic increases from without and by growth resulting from interest accretions. Various modifications of this procedure may exist. Thus interest may not be added to principal. Theoretically a reserve and its corresponding fund might be expected always to be equal. In practice various things may cause them to be unequal. Funds, moreover, do not accumulate in exact accord with compound interest formulas because of the practical impossibility of investing income so that at no time will any of it remain idle. When a reserve of surplus is established, the effect is to prevent the distribution of so much wealth as dividends, but it remains a part of the general funds unless set aside in the form of a fund, as explained above. For purposes of bond redemption, funds are desirable, because the wealth represented by a reserve may not be in the necessary form when the redemption date arrives.

Trust deeds usually provide instructions for the establishment of sinking funds for bond issues. Sometimes they provide that these shall be created out of profits. If so, this is accomplished by a charge to **Surplus** and a credit to **Sinking Fund Reserve,** or similar title. Retirement of bonds does not affect the reserve, which should then be transferred to Surplus.

A **true sinking fund** must:

1. Be in form of cash or securities.
2. Accumulate at compound interest.
3. Be established to pay at maturity a debt now owing or certain to be incurred.

If the fund is employed to cancel bonds before maturity, it is a **redemption fund.** If the bonds are merely bought up and made a part of the fund, thus remaining as liabilities on the balance sheet, the fund remains a sinking fund.

The **Sinking Fund account** should be charged with value of assets transferred

to it from general funds and with income derived from money already in the fund. It should be credited with amounts disbursed therefrom.

Accounts descriptive of the form which the sinking fund takes may be desirable, as, **Sinking Fund Securities, Sinking Fund Cash,** etc. Cash paid from the sinking fund for securities to be put into it is a charge to Sinking Fund Securities and a credit to Sinking Fund Cash.

The **Sinking Fund Income account** should be credited with income in form of interest or dividends received from sinking fund securities, and charged when this is transferred to Profit and Loss or to the Sinking Fund Reserve account.

The **Sinking Fund Expense account** should be charged with all expenses incurred in connection with the operation of the sinking fund, and credited when its balance is transferred to Profit and Loss or to the Sinking Fund Reserve account.

Regulations of Interstate Commerce Commission regarding **sinking fund accounts** of railroad companies provide that these accounts shall include cash, ledger value of live securities of other companies, and other assets held by sinking fund trustees to pay off outstanding debts. Assets held in hands of accounting company's treasurer when the assets are segregated under a distinct fund are to be included. Also amounts deposited with sinking fund trustees on account of mortgaged property sold, the proceeds of which are to be held for redemption of securities. Also par value of live securities issued or assumed by accounting company and held in such funds. A separate account is required for each fund, the title of which must designate the obligation in support of which the fund is created.

Regarding **sinking fund reserves,** the Commission's ruling is to the effect that the Sinking Fund Reserve account shall include net balances in accounts to which are credited definite appropriations of surplus, whether held in general funds or placed in hands of a trustee as a sinking fund or redemption fund. It also includes income accruing to such a fund.

For a discussion of method of determining **sinking fund annuities,** see section on "Mathematics."

ENTRIES FOR SINKING FUND TRANSACTIONS. — The trustee may be an individual or a trust company. The trustee renders such reports as are necessary to enable the company to bring summary entries upon the books.

Having determined the amount of the equal periodic instalments to be paid to the trustee of the sinking fund by principles explained elsewhere (see section on "Mathematics"), the transfer of cash into the trustee's hands is indicated by an entry charging **Sinking Fund** or the **name of the trustee,** and crediting Cash. Thus if the semiannual deposit with the trustee is to be $17,521.52, the entry is:

Sinking Fund Trustee	$17,521.52	
Cash		$17,521.52
For deposit of cash with trustee in accordance with deed of trust of 6% first mortgage sinking fund bonds due Jan. 1, 1932.		

Instead of title, "Sinking Fund Trustee," other possible ones are: "Sinking Fund Cash," "Sinking Fund of First Mortgage 6% Bonds of 1932," "Columbia Trust Co., Trustee," etc.

Interest earned by the sinking fund must be accounted for by the company which creates the fund. Assume trustee reports earnings semiannually on above fund. At end of 6 months his report shows earnings of $350.43. Upon receipt of report following entry is in order on company's books:

Sinking Fund Trustee............................	$350.43	
Sinking Fund Income......................		$350.43
To record income earned on sinking fund in hands of trustee for 6 months ending..........		

Ordinarily the sinking fund income will in turn be carried to Profit and Loss, although it may be credited directly to the Sinking Fund Reserve. Unless there is specific reason for doing otherwise, the former procedure should be followed. Unless there is definite provision in the trust deed, the sinking fund income may (a) be turned over to the corporation, (b) be added to the sinking fund, (c) be used to reduce amount of the succeeding instalment. In case of **true sinking funds** the income is added to the fund. If desirable to show monthly accruals of sinking fund income, this following entry may be made:

Accrued Sinking Fund Income......................	$58.41	
Sinking Fund Income........................		$58.41
To show accrued income on sinking fund for month ending...........		

When income is received by the trustee, as shown by statement submitted, **Accrued Sinking Fund Income** is credited and **Sinking Fund Trustee** is charged.

If the trustee invests the funds in securities, an entry should be made as soon as report of transaction is received from trustee, charging **Sinking Fund Investments** and crediting **Sinking Fund Trustee** for amount thus invested. As income is received on these investments and reported to the company, **Sinking Fund Trustee** is charged and **Sinking Fund Income** credited.

If the trust deed specifies that the sinking fund reserve and the sinking fund must be kept equal, then for each accretion to the fund there must appear a credit to the reserve, while for each reduction of the fund there must appear an equivalent charge to the reserve. The Surplus account is charged or credited accordingly as the reserve is credited or charged.

When sinking fund cash is employed to purchase company's own securities, these may be either canceled or kept alive in the sinking fund. In former case the fund is a redemption fund; in the latter case it is a true sinking fund. If outstanding bonds are purchased for the sinking fund at a premium the premium is an expense which must be charged off at once or be amortized over remaining life of bonds. If a corporation buys $50,000 of its outstanding bonds at 105, the entry is:

Sinking Fund Investments........................	$50,000	
Premium on Sinking Fund Investment.............	2,500	
Sinking Fund Trustee......................		$52,500

Under the federal income tax law of 1921, such premium above issuing price or face value is considered an expense of the year in which bonds are repurchased or retired. Similarly, if repurchased or retired at less than issuing price or face value, the difference is regarded as income for the current year. For provision applicable in case of bonds issued at a premium or a discount, consult Treasury regulations. In order to conform with these requirements, many corporations write off such premiums in year securities are repurchased.

The **trustee** must keep **complete accounts** for all transactions relating to the funds intrusted to him. These accounts must be in agreement with those of the corporation which he serves. The trustee acts in the capacity of a **fiduciary**, and the principles of fiduciary accounting apply. Accounts should be kept with **Cash** and **Investments**, preferably as many investment accounts as there are investments. When the trustee receives cash from the company, he charges

Cash and credits **Sinking Fund** or **Bond Redemption Fund** of so and so company. The charge to this account occurs when the bonds are redeemed or paid at maturity. If the trustee pays interest on outstanding bonds of the company, he charges **Cash** and credits **Interest Payable** when money is received therefor from company. As the coupons are paid, **Cash** is credited and **Interest Payable** charged.

ILLUSTRATIONS OF SINKING AND REDEMPTION FUNDS.—1. The Robert Gair Co. First Mortgage Gold 7's, dated Jan. 1, 1922, due Jan. 1, 1936. Authorized, $6,000,000; outstanding $4,000,000. Redeemable on any interest date on 30 days' notice at 110 and interest up to Jan. 1, 1923, and ½% less each year thereafter. Commencing May 1, 1923, an amount equal to 15% of net earnings of preceding calendar year, but not less than $150,000 annually, to be devoted to retirement by purchase or by call of these bonds at not over then existing redeemable price. Company has right to tender bonds of this issue at par, in lieu of cash to satisfy sinking fund requirements. Minimum annual sinking fund will be increased by an amount equal to 5% of any additional bonds issued.

2. The National Tube Co. First Mortgage Gold 5's, dated May 1, 1912, due May 1, 1952. Authorized, $15,000,000; outstanding, $12,271,000. Redeemable at 105 and interest on any interest date upon 6 weeks' notice. Beginning May 1, 1916, 1% annually of all bonds issued to be applied to purchase or redemption of these bonds at not over 105 and interest. Bonds so redeemed to be kept alive and interest added to sinking fund.

3. The Sinclair Pipe Line Co. 20-Year Sinking Fund Gold 5's, dated Oct. 2, 1922, due Oct. 1, 1942. Authorized, $25,000,000; outstanding $25,000,000. Within 3 months after Oct. 1, 1924, and within 3 months after each succeeding Apr. 1 and Oct. 1, respectively, the company will expend the sum of $425,000 in the purchase in the open market of bonds of this issue, if obtainable at prices not exceeding face value thereof and accrued interest. If at expiration of any such 3 months' period amount expended in purchase of bonds for such period shall be less than $425,000, company shall pay over to the trustee amount of such deficiency, if more than $10,000. Trustee shall invite tenders for sale of bonds at prices not exceeding face value thereof and accrued interest, and any unexpended balance shall be returned to company and carried on its books as a special reserve for retirement of bonds. From time to time thereafter, company will use its best efforts to purchase from such reserve as many bonds as possible, at not exceeding face value thereof and accrued interest, provided that in no case shall it be required to purchase in any one year from said reserve more than $1,000,000 aggregate principal amount. All bonds purchased in accordance with foregoing provisions shall be canceled by trustee and permanently retired. The company may exceed its sinking fund obligation in any period and to that extent receive credit therefor in any subsequent period.

4. Oregon & California R. R. Co. First Mortgage Sinking Fund Gold 5's, dated July 1, 1887, due July 1, 1927. Authorized, $20,000,000; outstanding, $17,505,000. Net proceeds from sale of lands shall be applied to purchase of these bonds at not exceeding par; but in case they cannot be purchased at this figure, they shall be redeemed by lot as soon as the sum of $50,000 has accumulated. As of Dec. 31, 1921, there were held in fund $37,000 Southern Pacific Equipment A and B 4½'s and $38,000 Southern Pacific First Refunding 4's.

5. American Can Co. 15-Year Debenture Sinking Fund Gold 5's, dated Feb. 1, 1913, due Feb. 1, 1927. Authorized, $15,000,000; outstanding, $9,655,500. On or before May 1, 1914, and in each year thereafter, company must pay

to trustee $500,000 in cash, to be invested in bonds of this issue at not exceeding 102½ and accrued interest, or, if not so purchasable, to be used to call bonds by lot at that price. This will result in retirement of approximately $7,000,000 bonds before maturity. All bonds acquired by sinking fund must be canceled.

6. Anaconda Copper Mining Co. 10-Year Secured Gold 6's, Series A, and 7's, Series B, dated Jan. 1, 1919, due Jan. 1, 1928. It is required that $1,500,000 per annum, payable semiannually on Jan. 1 and July 1 each year beginning July 1, 1921, be used for purchase and retirement of such Series A and Series B bonds as may be tendered on most advantageous terms; to the extent that if bonds cannot be purchased at prices to yield 6% or more per annum, unexpended moneys shall revert to company.

7. Hershey Chocolate Corp. First Lien Gold 7½'s, dated June 1, 1920, due June 1, 1930. Authorized, $10,000,000; outstanding, $9,004,900. It is required that $125,000 quarterly beginning Sept. 1, 1920, and in addition within 90 days after Dec. 31, 1920, a sum equal to amount, if any, by which 14 7/12% of net income for preceding year shall exceed sum of $250,000; and within 90 days after close of each year after the year 1920, a sum equal to the amount, if any, by which 25% of net income of year preceding such payments shall exceed sum of $500,000, shall be applied to purchase of bonds at not exceeding current redemption prices. If on May 1 in any year unapplied moneys shall amount to $50,000 or more, same shall be applied to redemption of bonds on June 1 next succeeding, at current redemption price.

A **study of foregoing provisions** shows that it is now customary to make redemption of outstanding issues before maturity rather than to permit all sums paid into the fund to accumulate until the entire issue can be paid off *in toto*. There are **five ways in which bonds may be redeemed:**

1. Through sinking fund at maturity.
2. Serially.
3. Conversion into stock.
4. Called in for redemption before maturity.
5. Refunding at maturity.

REDEMPTION THROUGH SINKING FUND.—Strictly speaking, a sinking fund is one employed to pay off bonds at maturity. In practice this use of the term is departed from. When bonds are paid out of sinking fund at maturity, entries required are comparatively simple. When notice is received from trustee to effect that all investments have been converted into cash in preparation for liquidation of indebtedness, charge **Sinking Fund Cash** and credit **Sinking Fund Investment.** When bonds are paid off by trustee, charge **Bonds** and credit **Sinking Fund Cash.** If a **Sinking Fund Reserve** account has been set up, it should now be closed into Surplus.

SERIAL REDEMPTION.—Serial bonds are usually redeemed in fixed sums each year but frequently with a proviso that later maturities may be redeemed upon certain conditions.

Illustration.—Fisher Body Corp. 6% Serial Gold Notes, due $1,000,000 each Aug. 1, 1923 to 1925. Redeemable as a whole or in series (in which latter case the series first maturing must be first redeemed) on any interest date upon 60 days' notice, at following prices with accrued interest: 101½ for notes then having 2 years or more, but less than 3 years to run; 101 for notes then having 1 year or more, but less than 2 years to run; 100½ for notes then having less than 1 year to run.

If redeemed at par, charge **Serial Bonds** and credit **Cash.** If redeemed at a premium, credit **Cash** and charge **Serial Bonds** and **Premium on Serial Bonds.**

CONVERSION.—A convertible bond is one which can be converted into other securities of the issuing corporation. Usually such bonds are convertible into common stock, and are thus given speculative flavor.

Illustration.—Cerro de Pasco Copper Corp. 10-Year Convertible Gold 8's are convertible into stock of the corporation at rate of 30 shares stock for each $1,000 bond, equivalent to a price of $33 1/3 per share of stock. Should bonds be called for redemption, convertible clause remains in force to and including redemption date. Where such privilege exists provision must be made so that sufficient authorized but unissued stock will be in existence to make the conversion should the bondholders demand it. At time of conversion charge **Convertible Bonds** and credit **Unissued Capital Stock.**

CALLING FOR REDEMPTION.—Many bond issues floated in recent years are made **callable** for redemption because of the high interest rate necessitated by abnormal war conditions, at which they were put out.

Illustration.—Cerro de Pasco Copper Corp. 10 Year Convertible Gold 8's, dated Jan. 1, 1921, due Jan. 1, 1931, are redeemable at 105 and interest on any interest date, upon 60 days' notice. Armour & Co. 7% Convertible Gold Notes, dated July 15, 1920, due July 15, 1930, are redeemable at 105 and interest upon 60 days' notice. Where collateral trust bonds are redeemed and pledged collateral is released, an entry should be made charging **Investments** and crediting **Pledged Investments.**

REFUNDING AT MATURITY.—No special problems arise. Sufficient cash should be on hand in sinking fund to liquidate issue. If not, a transfer of cash to trustee sufficient to make full payment should be made.

SINKING FUND ILLUSTRATED—A company issues 20-year sinking fund bonds on Jan. 1, 1919, bearing 6% interest, payable semiannually, Jan. 1 and July 1. Trust deed requires yearly contributions to a sinking fund which are to accumulate at compound interest. Bonds sell at a premium. Show pro forma journal entries on following dates:

Jan. 1, 1919	Jan. 1, 1920
July 1, 1919	Jan. 1, 1939

Surplus		$......
To transfer Sinking Fund Reserve to Surplus upon retirement of bonds.		

Partnership Incorporated

OBJECTS OF INCORPORATION.—Partnerships are incorporated for various reasons, chief among which are the limited liability thus secured and the possibility of expansion through sale of capital stock.

PROCEDURE.—Before transferring assets to corporation it is necessary to make a valuation of them, in order that the partners will secure a fair interest in the corporation. **Good-will** is an item of importance and one which may have been given no value on books of partnership. The valuation placed on partners' assets should not be so great as to militate against future welfare by making disposition of stock to outsiders difficult. Value of good-will should be based on excess earning power of partnership. (See section on "Good-Will.") Roughly, good-will value can be determined by capitalizing earnings on a percentage which represents the normal return stockholders would expect to receive in such an enterprise. If partnership earns 15% on capital of partners and the public secures 6% on money invested in stocks of companies doing a similar business and affording equivalent security, the difference between 15% and 6%, or 9%, represents earning power of good-will. Thus if profits of

partnership amount to $15,000 on partners' combined capital accounts of $100,000, the difference between $100,000 and the capitalization of $15,000 on a 6% basis, or $250,000, gives value of good-will, $150,000. Having ascertained value of good-will, make an entry in books of partnership charging **Good-Will** and crediting **Capital** account of partners with their due proportions thereof.

Capitalization of company which is to supersede the partnership must be determined on basis of present and future requirements.

If **old books** are continued, such alterations must be made as are necessary to the corporation. The partners' accounts should be closed and such accounts opened as are peculiar to corporation accounting.

Illustration.—Balance sheet of Johnson & Thorpe, after adjustment for good-will, is as follows:

Balance Sheet—Johnson & Thorpe
As at January 1, 19—

Real Estate	$27,000	Johnson, Capital	$45,000
Good-Will	25,000	Thorpe, Capital	30,000
Merchandise	6,000	Accounts Payable	6,000
Accounts Receivable	16,000		
Cash	7,000		
	$81,000		$81,000

This balance sheet shows net worth at figure at which partners are willing to make the exchange for stock. The corporation, to be called the Johnson-Thorpe Co., is to have an authorized capital stock of $100,000, of which $75,000 is to be given to the old partners—$45,000 to Johnson and $30,000 to Thorpe.

A formal entry for capital stock authorized is:

Unissued Capital Stock	$100,000	
Capital Stock Authorized		$100,000
For total capital stock authorized, as per charter.		

Johnson and Thorpe are next charged as subscribers, thus:

Subscribers	$ 75,000	
Unissued Capital Stock		$ 75,000

Next an entry is necessary to charge the partners' Capital accounts and credit Subscribers account, thus:

Johnson, Capital	$ 45,000	
Thorpe, Capital	30,000	
Subscribers		$ 75,000

To close Capital accounts against subscriptions.

If additional unissued stock is sold, suitable entries are required to show this, but these are no different than those explained elsewhere.

If **new books** are to be used by the corporation, all accounts in the old books must be closed and all assets and liabilities transferred to the new ledger. In the books of the partnership the Johnson-Thorpe Co. should be charged with value of assets taken over and credited with amount of liabilities assumed, thus:

Johnson-Thorpe Co.	$81,000	
Real Estate		$27,000
Good-Will		25,000
Merchandise		6,000
Accounts Receivable		16,000
Cash		7,000

To charge the Johnson-Thorpe Co. for value of assets of firm of Johnson & Thorpe as per conditions of agreement made between Johnson & Thorpe and the Johnson-Thorpe Co., which latter is to take over the assets and assume the liabilities of the firm of Johnson & Thorpe.

Accounts Payable	$ 6,000	
Johnson-Thorpe Co.		$ 6,000

To credit the Johnson-Thorpe Co. with the liabilities of the firm of Johnson & Thorpe, these accounts being assumed by the Johnson-Thorpe Co. as per agreement.

Johnson-Thorpe Co. now stands charged on books of Johnson & Thorpe for $75,000. This is the amount of stock of the Johnson-Thorpe Co. subscribed by the partners, Johnson & Thorpe. Upon receipt of stock by Johnson & Thorpe, following journal entry is made:

Capital Stock of Johnson-Thorpe Co.	$75,000	
Johnson-Thorpe Co.		$75,000

To charge capital stock of the Johnson-Thorpe Co. for amount received, $75,000, this being the consideration for which Johnson and Thorpe agree to sell their interest to the Johnson-Thorpe Co.

The following entry closes the accounts now remaining open on the books of Johnson & Thorpe:

Capital, Johnson	$45,000	
Capital, Thorpe	30,000	
Capital Stock of Johnson-Thorpe Co.		$75,000

In books of Johnson-Thorpe Co. entry should be made to charge assets taken over from Johnson & Thorpe, to credit Subscribers account, assuming that this account has been opened, and to credit liabilities assumed, as follows:

Real Estate	$27,000	
Good-Will	25,000	
Merchandise	6,000	
Accounts Receivable	16,000	
Cash	7,000	
Subscribers		$75,000
Accounts Payable		6,000

To bring upon books assets purchased from Johnson & Thorpe, to credit liabilities of Johnson & Thorpe assumed, and to credit Subscribers account with excess of assets purchased over liabilities assumed.

Trial balance of ledger of Johnson-Thorpe Co. follows:

Trial Balance—Johnson-Thorpe Co.

Real Estate	$27,000	Capital Stock	$75,000
Good-Will	25,000	Accounts Payable	6,000
Merchandise	6,000		
Accounts Receivable	16,000		
Cash	7,000		
	$81,000		$81,000

This Agreement for Incorporation made this 28th day of April, 19—, by and between Robert Lowell, Walter F. Mason, and Norman Lowell, copartners in the manufacture and sale of chemicals and chemical supplies in the city of Chicago, under the firm name of Lowell, Mason & Company, and Nelson G. Oliver and George Dickson, copartners in the manufacture of chemicals, also in the city of Chicago, under the firm name of Oliver & Dickson.

Witnesseth:

1. That the business heretofore conducted by each of the above-named firms shall be amalgamated and incorporated under the laws of the State of Illinois as the Lowell-Mason Chemical Company.

2. That the capital stock of said corporation shall be Five Million Dollars ($5,000,000), consisting of Three Million Dollars ($3,000,000) of common stock, being 30,000 shares of the par value of One Hundred Dollars ($100) each, and Two Million Dollars ($2,000,000) of seven per cent (7%) cumulative preferred stock, being 20,000 shares of the par value of One Hundred Dollars ($100) each. Three Million Dollars ($3,000,000) of the common stock, being the entire issue thereof, and One Million Dollars ($1,000,000) of the preferred stock, is to be issued full-paid in exchange for the said businesses as going concerns as hereinafter stated, including all of their assets, credits, trade-names, formulas, and good-will, and said incorporated company shall assume all of the outstanding liabilities of the said firms as existing at the time of transfer on the date of final organization.

3. That the stock of the said corporation shall be issued full-paid as follows: To the aforesaid firm of Lowell, Mason & Company, One Million, Five Hundred Thousand Dollars ($1,500,000) of common stock and Five Hundred Thousand Dollars ($500,000) of preferred stock, distributed to the partners as follows:

Robert Lowell,	7,500	shares	common	and	2,500	shares	preferred
Walter F. Mason,	6,000	"	"	"	2,000	"	"
Norman Lowell,	1,500	"	"	"	500	"	"

To the aforesaid firm of Oliver & Dickson, One Million, Five Hundred Thousand Dollars ($1,500,000) of common stock and Five Hundred Thousand Dollars ($500,000) of preferred stock, divided equally between the partners.

The remaining stock, being One Million Dollars ($1,000,000) of preferred stock, is to be underwritten by Baker, Wilson & Shaw, bankers, at 95 (5% commission), a contract to that effect having already been executed.

4. And it is covenanted and agreed that Two Hundred Thousand Dollars ($200,000) of common stock shall be returned by the aforesaid contracting parties to the corporation, One Hundred Thousand Dollars ($100,000) from each firm, to be treasury stock and to be given to the said bankers free of charge as a bonus with the One Million Dollars ($1,000,000) of preferred stock subscribed by them.

Form 8. Agreement for Incorporation

TWO PARTNERSHIPS INCORPORATED.—Two Chicago partnerships are to be incorporated, entire business of each being transferred to a corporation. In Illinois entire capital stock must be subscribed and one-half paid up before company can begin operations; therefore partnership agreements to take stock appear in application for charter. Actual transfer of partnership assets and liabilities to the corporation is not made until latter is completely organized and ready to make contracts. Transfer to corporate form does not require any change in established policy of management or in method of keeping books, except in so far as capital accounts must be altered. Preliminary agreement for incorporation is shown in Form 8.

Preferred stock for $1,000,000 is underwritten by bankers who agree to take entire block at 95. The $50,000 difference between par and 95 is a selling expense. Bonus of treasury stock given bankers may be entered on books, as shown later, or be transferred from stockholders to bankers or to new purchasers without being entered on books. Bankers frequently turn over check to company in full payment for stock underwritten and receive in return a check for difference between this amount and underwritten price, this amount being charged to **Commissions** or **Underwriting Expense.** In present case 50% of par value of underwritten stock ($500,000) is paid at the time, and a check for $25,000 (5% commission on 50% of underwritten stock) is given. Remainder of underwriters' subscription will be paid later.

Balance sheets of the two partnerships, Lowell, Mason & Co. and Oliver & Dickson, as of May 1, 19—, before incorporation, are given below. These statements and data from incorporation agreement form basis for opening entries on books of new company.

Lowell, Mason & Company
Balance Sheet as at May 1, 19—

Assets		Liabilities		
Land	$ 100,000	Mortgage Payable		$ 100,000
Buildings	150,000	Interest Accrued		2,500
Machinery and Tools	115,000	Notes Payable		40,000
Patents and Patterns	72,800	Interest Accrued		1,500
Trucks and Motors	25,000	Accounts Payable		30,250
Fuel and Supplies	12,400	Accrued Taxes		6,500
Raw Material	52,800	Reserve Accounts:		
Work in Process	57,300	For Depreciation		12,000
Finished Stock	44,900	For Bad Debts		2,200
Deferred Charges to Operating	9,250	Capital Accounts:

	$1,274,600			$1,274,600

Opening entries for new company should record correctly and in due sequence various transactions involved in incorporation of the company and in transferring to it, in exchange for capital stock, entire plant, business, and net assets of each firm.

May 1, 19—

Lowell, Mason & Co.	$2,000,000	
Oliver & Dickson	2,000,000	
Baker, Wilson & Shaw	1,000,000	
Common Stock		$3,000,000
Preferred Stock		2,000,000

The Lowell-Mason Chemical Co. is incorporated this day under the laws of Illinois, with a capital stock of $5,000,000, divided into 30,000 shares of common stock of the par value of $100 each, and 20,000 shares of 7% cumulative preferred stock of the par value of $100 each. From the firms above debited, subscriptions have been received for the entire common and preferred stock of the company, the distribution of this stock, as per agreement for incorporation, the subscription list, and the certificate of incorporation, being as follows:

	Shares	
Name	Common	Preferred
Robert Lowell	7,500	2,500
Walter F. Mason	6,000	2,000
Norman Lowell	1,500	500
Nelson G. Oliver	7,500	2,500

George Dickson	7,500	2,500		
Baker, Wilson & Shaw	......	10,000		
Total	30,000	20,000		
Land			$ 100,000	
Buildings			150,000	
Machinery and Tools			115,000	
Patents and Patterns			72,800	
Trucks and Motors			25,000	
Fuel and Supplies			12,400	
Raw Material			52,800	
Work in Process			57,300	
Finished Stock			44,900

Investments in Stocks and Bonds			143,700	
Notes Receivable			142,000	
Accounts Receivable			174,800	
Cash			95,000	
Good-Will			1,000,000	
Mortgage Payable				$ 100,000
Interest Accrued				4,000
Notes Payable				40,000
Accounts Payable				30,250
Accrued Taxes				6,500
Reserve for Depreciation				12,000
Reserve for Bad Debts				2,200
Lowell, Mason & Company				2,000,000

To record in the ledger the various specific assets and liabilities turned over by Lowell, Mason & Co. as a going concern, in full payment of stock subscriptions to 15,000 shares of common and 5,000 shares of preferred stock of the company, as per agreement for incorporation. (See minute book, page 5.) All right, title, and interest in the assets of Lowell, Mason & Co. are conveyed to the Lowell-Mason Chemical Co., and all liabilities of that firm are assumed by the Lowell-Mason Chemical Co., as per agreement for incorporation.

Leasehold	$ 156,000
Machinery and Tools	85,000
Delivery Equipment	30,000
Fuel and Supplies	9,400
Patents and Patterns	122,000
Raw Material	75,100
Work in Process	80,900
Finished Stock	198,000
Deferred Charges	12,300
Bonds and Securities	150,000
Accounts Receivable	223,000

Cash	134,400	
Good-Will	1,000,000	
Notes Payable (Secured)		$ 126,000
Accounts Payable		136,300
Interest Accrued		1,600
Reserve for Bad Debts		1,500
Accrued Operating Charges		10,700
Oliver & Dickson		2,000,000

To record the specific assets and liabilities turned over by Oliver & Dickson, taken by this company as a going concern, as per agreement for incorporation. (See minute book, page 5.)

Entries for payment by underwriters showing commission and turning over of donated stock follow:

Cash	$500,000	
Baker, Wilson & Shaw		$500,000

Payment of 50% of subscription of Baker, Wilson & Shaw, underwriters, to $1,000,000 of preferred stock.

Organization Expense	$ 31,000	
Cash		$ 31,000

By order of the Directors for payment of various expenses incurred during the incorporation of the company, including 5% commission to Baker, Wilson & Shaw on $500,000 of stock subscription. (*Give items in detail.*)

Treasury Stock—Common	$200,000	
Stock Donation Account		$200,000

2,000 shares of common stock donated to the company in accordance with the agreement for incorporation, as follows:

Lowell, Mason & Co.	1,000 shares
Oliver & Dickson	1,000 "

Stock Donation Account	$200,000	
Treasury Stock—Common		$200,000

For the bonus of 2,000 shares of common stock transferred to Baker, Wilson & Shaw as per underwriting contract, being one share of common stock for every five of preferred stock underwritten. This stock has been donated by the incorporators and is full-paid and non-assessable.

Method of closing partnership books is illustrated in detail by closing entries for Lowell, Mason & Co. Somewhat different procedure is shown in condensed form for Oliver & Dickson. Frequently old books are retained. In present instance new books are opened, consequently all asset and liability accounts must be closed on partnership books and balances transferred to cor-

poration's accounts. Each firm is allowed $1,000,000 for good-will. The two firms receive stock of new company in exchange for assets. This is in turn given to the former partners as per agreement. Entries to close accounts of Lowell, Mason & Co. are shown below:

May 1, 19—

Good-Will	$1,000,000	
Robert Lowell		$ 500,000
Walter F. Mason		400,000
Norman Lowell		100,000
To place upon the books good-will of $1,000,000 in accordance with agreement for incorporation of the Lowell-Mason Chemical Co. entered into April 28, 19—. Good-Will apportioned according to the partners' holdings.		
Lowell-Mason Chemical Co.	$2,194,950	
Land		$ 100,000
Buildings		150,000
Machinery and Tools		115,000
Patents and Patterns		72,800
Trucks and Motors		25,000
Fuel and Supplies		12,400
Raw Material		52,800
Work in Process		57,300
Finished Stock		44,900
Deferred Charges to Operating		9,250
Investments in Stocks and Bonds		143,700
Notes Receivable		142,000
Accounts Receivable		174,800
Cash		95,000
Good-Will		1,000,000
Plant, good-will, and sundry assets turned over to the Lowell-Mason Chemical Co. in exchange for $2,000,000 par value of stock of that Company as per agreement for incorporation.		
Mortgage Payable	$ 100,000	
Notes Payable	40,000	
Interest Accrued	4,000	
Accounts Payable	30,250	
Accrued Taxes	6,500	
Reserve for Depreciation	12,000	
Reserve for Bad Debts	2,200	
Lowell-Mason Chemical Co.		$ 194,950
To close accounts and transfer to Lowell-Mason Chemical Co. all of the liabilities of this firm, as per agreement for incorporation.		

Only accounts now remaining open on books of Lowell, Mason & Co. are partners' Capital accounts and debit against Lowell-Mason Chemical Co.

When required amount of stock of this company is received and distributed to former partners, following entries are made on books of Lowell, Mason & Co.

Stock of Lowell-Mason Chemical Co.	$2,000,000	
Lowell-Mason Chemical Co.		$2,000,000
For 20,000 shares of stock of Lowell-Mason Chemical Co. received today in full payment for net assets shown in the previous entries. The stock is issued in the partners' names as follows:		

Names	Shares Com-mon	Shares Pre-ferred	Par Value
Robert Lowell...	7,500	2,500	$1,000,000
Walter F. Mason	6,000	2,000	800,000
Norman Lowell..	1,500	500	200,000
Total.......	15,000	5,000	$2,000,000

Robert Lowell	$1,000,000	
Walter F. Mason	800,000	
Norman Lowell	200,000	
Stock of Lowell-Mason Chemical Co.		$2,000,000
For distribution of the above-mentioned stock to the partners, and to close the Capital accounts of the firm.		

A different plan of closing partnership books is shown in following entries for Oliver & Dickson.

Good-Will	$1,000,000	
Nelson G. Oliver		$ 500,000
George Dickson		500,000

(*Full explanation here.*)

Lowell-Mason Chemical Co.	$2,000,000	
Sundry Liabilities (*listed separately*)	276,100	
Good-Will and Sundry Other Assets (*listed separately*)		$2,276,100

(*Full explanation here for transfer of all assets and liabilities.*)

Nelson G. Oliver	$1,000,000	
George Dickson	1,000,000	
Lowell-Mason Chemical Co.		$2,000,000
To close Capital accounts of the partners upon distribution to them of stock of the Lowell-Mason Chemical Co.:		

Name	Shares Common	Shares Preferred
Nelson G. Oliver......	7,500	2,500
George Dickson.......	7,500	2,500
Total...........	15,000	5,000

Balance sheet of new company is as follows:

Lowell-Mason Chemical Company

Balance Sheet as at May 1, 19—

Assets		Liabilities	
Land	$ 100,000	Mortgage Payable	$ 100,000
Buildings	150,000	Notes Payable	166,000
Machinery and Tools	200,000	Accounts Payable	166,550
Patents and Patterns	194,800	Interest Accrued	5,600

Good-Will	2,000,000		
	$5,471,050		$5,471,050

Proprietorship Incorporated

PROCEDURE.—C. W. Hampton, in the wholesale and retail mercantile business, incorporated as of May 9, 19—, under name of Hampton Trading Corp., capital stock $250,000, shares 2,500, of par value of $100 each.

Charles W. Hampton

Balance Sheet, as at May 1, 19—

Assets		Liabilities	
Land	$ 30,000	Mortgage on Warehouse	$ 25,000
Store and Warehouse	50,000	Loans from Bank	10,000
Store Equipment	8,500	Notes Payable	17,750
Delivery Equipment	9,000	Accounts Payable	22,800
Office Equipment	4,400		
Merchandise	46,300	Total Liabilities	$ 75,550
Accounts Receivable	16,400	Charles W. Hampton, Capital Account	105,140
Notes Receivable	9,350		
Cash	6,740		
	$180,690		$180,690

The shares have been subscribed for as follows:

Name	Address	Shares	Amount
Charles W. Hampton	New York City	1,250	$125,000
Samuel Johnson	"	500	50,000

James J. Miller	New York City	500	50,000
Lincoln Webster	Albany, New York	100	10,000
Robert W. Kester	"	100	10,000

Hampton is to receive 1,250 shares of full-paid stock in exchange for his business, including assets and liabilities as per balance sheet. Subscribers are to pay 50% on subscriptions when business is taken over, and remainder on Aug. 9. Good-Will is to be brought in at $19,860, which is excess of capital stock paid, $125,000, over Hampton's net worth, $105,140, as shown per balance sheet. The **opening entry** is as follows:

May 9, 19—

Charles W. Hampton	$125,000	
Samuel Johnson	50,000	
James J. Miller	50,000	
Lincoln Webster	10,000	
Robert W. Kester	10,000	
Unissued Stock	5,000	
Capital Stock		$250,000

Hampton Trading Corp. incorporated with an authorized capital of $250,000, divided into 2,500 shares of $100 each, subscribed for as follows:

Charles W. Hampton	1,250 shares
Samuel Johnson	500 "
James J. Miller	500 "
Lincoln Webster	100 "
Robert W. Kester	100 "
Unissued Stock	50 "

Subscriptions payable 50% in cash and balance Aug. 9, 19—.

At time of incorporation certain necessary expenses must be advanced by incorporators or by the attorney in charge. These are reimbursed after organization. All cash entries are given in cash book shown below. Only remaining journal entry required is that recording transfer of assets and liabilities from Hampton to the corporation.

Cash Book

19—			19—		
May 9	Samuel Johnson (Paid on May 2)	$ 500	May 9	Organizing Expenses:	
	Charles W. Hampton (balance transferred)	6,740		Organization Tax	$ 125
	Lincoln Webster	5,000		Filing Certificate	10
	Samuel Johnson	24,500		Recording Fees	20
	James J. Miller	25,000		Counsel's Fee	250
	Robert W. Kester	5,000		Accountant's Fee	250
	(Payment of first instalment of 50% on subscriptions to stock.)			Other Outlays	200
				Balance	65,885
		$66,740			$66,740

Cash turned over by Hampton is included in the journal entry to show all assets and liabilities together. This plan is preferable because it sets forth the entire transaction. Cash account is ticked in the journal and general ledger account in the cash book, to indicate that they are not to be posted. If this were not done the items might be posted from both books.

Land	$30,000	
Store and Warehouse	50,000	
Store Equipment	8,500	
Delivery Equipment	9,000	
Office Equipment	4,400	
Merchandise	46,300	
Accounts Receivable	16,400	
Notes Receivable	9,350	
Cash	6,740	
Good-Will	19,860	
Mortgages Payable		$25,000
Bank Loans		10,000
Notes Payable		17,750
Accounts Payable		22,800
Charles W. Hampton		125,000

For the entire assets and liabilities of Charles W. Hampton, taken over this day in full payment of his subscription. A good-will of $19,860 is allowed over and above the net worth indicated by his balance sheet. (See minutes of stockholders and of directors for authority and for further details.)

An account should be opened for **Unissued Stock.** When final payments are made by subscribers on Aug. 9, 19—, subscribers' accounts are credited and Cash debited, in cash book. In **stock ledger** records of stock holdings of each subscriber must appear. Instalment receipts are issued as payments are received. Stock certificates are made out when final payments on subscriptions are made.

Reserves and Surplus

NATURE OF SURPLUS.—In a balance sheet the Surplus account is measured by the excess of assets over liabilities and capital. The term **surplus** is used generally to represent the difference between net worth and par value of outstanding stock, or, in case of no-par stock, between net worth and amount received for the stock.

ORIGIN OF SURPLUS.—Surplus may arise in the following ways:

1. Ordinary operations of business.
2. Donation of company's own stock.
3. Revaluation of assets.
4. Sale of stock above par.

The following **outline** shows debits and credits to Surplus.

Surplus

Debit: At the close of each fiscal period, for the net loss, if any, as shown by the Profit and Loss account.

For any adjustment during the fiscal period which diminishes the profits of a previous fiscal period.

For the amount of extraneous or unusual losses.

For amounts set aside so as not to be available for dividends.

For the discount on the sale of the corporation's capital stock.

For amounts by which the book values of assets are decreased other than through wear and tear.

For the amounts of dividends declared.

Credit: At the close of each fiscal period, for the net profit, if any, as shown by the Profit and Loss account.

For any adjustments made during a fiscal period which should have been credited to some profit and loss account within a prior fiscal period; or which increase the profits of a prior fiscal period.

For the amount of extraneous or unusual profits.

For amounts previously set aside as not available for dividends, and now returned to the general surplus.

For the premiums received on the sale of the corporation's capital stock.

For amounts by which the book value of fixed assets is increased.

For amounts of donations to the corporation.

SURPLUS ADJUSTMENTS.—Corrections or omissions applicable to previous years should be adjusted directly through the Surplus account, not through current Profit and Loss. Thus if an invoice for $527 was wrongly entered:

Purchases	$572	
Accounts Payable		$572

The adjustment, when the error is discovered in the following year, is:

Accounts Payable	$ 45	
Surplus		$ 45

Usually there is no objection to the making of **minor adjustments** through current Profit and Loss, however; but they must not be so large as to have a material effect on showing of current operations.

Gains and losses not related to customary operations should not be permitted to affect current operating results, thus destroying their usefulness for comparative purposes. It is sometimes advisable to make adjustment for such extraordinary profits and losses directly through Surplus; but discretion should be exercised in this respect. The Federal Income Tax Laws have tended in the opposite direction, because the Bureau of Internal Revenue expects all items affecting current profit to be handled through Profit and Loss, in order that book profit may be proved by adding back to taxable income, income items not taxable and subtracting expenses not deductible. If unusual gains and losses are carried direct to Surplus, an awkward adjustment is necessary.

CLASSIFICATION OF RESERVES.—H. A. Finney classifies and describes reserves as follows:[2]

[2] *Journal of Accountancy*, Oct. 1922, pp. 251–261.

"I. **Profit and loss reserves,**[3] set up by debits to Profit and Loss, because some expense, properly chargeable to current operations, has resulted in
- (a) A decrease in the value of an asset; or
- (b) The creation of a liability.

II. **Surplus reserves,** representing
- (a) Conservative provisions for possible future losses, not already incurred; and
- (b) Appropriations of surplus, earmarked as unavailable for dividends because of
  - (1) Contracts with bondholders, other creditors, or preferred stockholders, in relation to sinking fund.
  - (2) Action by stockholders or directors intended to limit the payment of dividends for various financial reasons.

III. **Reserves for unrealized profits.**"

Following is a summary of Professor Finney's discussion:

Profit and loss reserves are set up by charges to nominal accounts or some section of the Profit and Loss account. They are necessitated by the fact that some expense has reduced net profit for the period. To be a true profit and loss reserve, the account must represent a provision for an expense or a loss which has already been incurred and is properly chargeable to current income. It is not necessary that its amount be definitely ascertainable, but there must be a certainty, or at least a high degree of probability, that the loss has actually been incurred as a result of past operations.

To show difference between a **profit and loss reserve** and a **surplus reserve,** assume that a company owns valuable machinery which it uses in manufacturing a peculiar type of product. A reserve for depreciation is necessary because of the certainty that depreciation is continually taking place. Since depreciation is a proper charge against current operations, the reserve for depreciation is profit and loss reserve.

The product manufactured by this machine may be superseded by some other article, or a new machine may be invented which will render the machine now owned obsolete. It may therefore be desirable to set up a reserve for supersession or obsolescence. This will not be a profit and loss reserve because the loss has not yet occurred, there is no certainty that it will ever occur, and if it does occur it will not be a result of the company's operations. If a provision is made for this possible loss and it would be conservative to make such a provision, it should be made out of surplus. The account representing the provision should be recognized as a part of the surplus and be shown so on the balance sheet.

Profit and loss reserves may be divided into two subclasses: reserves representing deductions from value of assets, and reserves representing liabilities.

In connection with reserves representing deductions from value of assets, term **reserve** should be used only in case amount of expense or loss, and consequently amount of decrease in asset value, cannot be definitely computed. This is the case with reserves for depreciation, reserves for depletion, and reserves for bad debts. These titles should be retained. The layman is fairly familiar with them. The deduction of the reserve from the related asset account makes the nature of the reserve self-evident. The layman can be relied upon to realize that an exact computation of the deduction is impossible and that the reserve is an estimate.

[3] Finney suggests that the term "reserve" be restricted to accounts of this class, and that other terms be applied to accounts belonging in other classes.

Reserves have often been set up to record decreases in asset values which are exactly measurable. Assume example of a company which leases property for 10 years and makes leasehold improvements which will revert to the owner of the real estate at expiration of lease. The asset of leasehold improvements decreases in value exactly 1/10 of cost. Since amount of annual reduction in value is definitely known, it is preferable to write down the asset.

As to subclass of profit and loss reserves representing liabilities for expenses already incurred, the amount of the liability may be only an estimate, or it may be definitely known. If only an estimate, there can be no objection to use of **reserve title,** although it is clearer to use a self-defining title, as **estimated liability for taxes.**

As to **surplus reserves,** the two subclasses have this feature in common: they are part of surplus and should be so shown on the balance sheet. As to first subclass, conservative provisions for contingent losses, it may be further subdivided, for if the contingency becomes a reality, loss may result in decreasing the value of an asset or in creating a liability. To illustrate, assume books are closed using market value of inventory at Dec. 31, which is lower than cost; but there is danger that the market may still further decline, causing additional loss. A reserve is set up by charging Surplus and crediting a Reserve for Market Fluctuations in Inventory. This reserve provides for a contingent loss on an asset.

In the second subclass of **surplus reserves,** i.e., those which are appropriations of surplus for financial purposes, we find the **Reserve for Sinking Fund, Reserve for Working Capital** and **Reserve for Extension of Plant.** For this purpose, it would be advisable to discontinue use of term **reserve** and use the term **appropriated surplus,** as **Surplus Appropriated for Sinking Fund**, etc. The surplus reserve accounts should be shown on balance sheet as part of surplus, thus:

Reserved for Contingent Fire Loss..........	$25,000	
Appropriated for Sinking Fund.............	10,000	
Total Surplus not Available for Dividends ...	$35,000	
Free and Available for Dividends...........	60,000	
Total Surplus......................		$95,000

In case of so-called sinking fund reserves, appropriated surplus should be amount which ought to be in fund if corporation were exactly meeting its obligations in the matter of contributions and if interest were being accumulated at theoretical rate used in determining amount of annual contributions. Thus fund account will show what is actually in the fund, while reserve will show what ought to be in the fund.

These accounts should not be set up by charges to Profit and Loss, and their existence should in no way affect the Profit and Loss account. They may be either contractual or optional. The trust indenture of a bond issue may specifically require segregation of surplus as well as the creation of a fund; or the requirement may be implied by the provision that the sinking fund shall be provided "out of profits." Same may be said if sinking fund is to be used to retire preferred stock.

If Sinking Fund Reserve or Appropriated Surplus account is required by contract, it should not be returned to surplus until last bondholder or preferred stockholder has been paid off through the sinking fund. This question rarely arises regarding sinking funds for bonds, but it does in regard to so-called sinking funds for preferred stock. When a sinking fund is created for bonds,

bonds purchased for the fund are held alive; thus fund and reserve steadily increase in amount until maturity of issue. But sinking fund for preferred stock is increased by contributions and forthwith decreased by purchase and cancellation of stock. The fund rises and falls; it does not steadily accumulate. The appropriated surplus is accumulated to safeguard working capital, to avoid jeopardizing future earnings, and to maintain company in an income-producing position that will enable it to meet future sinking fund requirements for retirement of remaining stock. Last preferred stockholder to be paid off through sinking fund has right to this protection.

Reserves for unrealized profits, the third class of reserves, are set up because fixed assets have increased in market value and because write-up ought not to be carried to Surplus. Finney suggests the title **unrealized increment,** as, **Unrealized Increment in Land Value,** to avoid use of the term **reserve.**

RESERVE FOR INCOME TAX.—Income taxes are a charge against the profits of the year in which levied, not in which paid. If possible, determine amount of income tax for past period at time of closing books. Then make an entry charging **Surplus** or **Profit and Loss** and crediting an **Accrued Taxes** account. Weight of authority advocates charging Surplus, reason being that the income tax is not a charge against profit because (1) it is determined after profit is determined, (2) it is a distribution of profit. Those who advocate charging to Profit and Loss claim that it is not an extraneous item and that Schedule "L" of income tax return is more easily prepared if disbursement is charged against profit and re-added as an unallowable deduction on the schedule. Entry should be in following form:

Profit and Loss (or Surplus)	$.	
Accrued Taxes		$. . . . . .
For federal income tax applicable to current year.		

CLASSIFICATION AND ANALYSIS OF SURPLUS.—The following classification and analysis of surplus, adapted from an article by C. B. Cushman,[4] is given to supplement material in preceding paragraphs.

I. **Sources of Surplus** are:

1. From contributions by the proprietorship.
2. From gifts, awards, or contributions from others than proprietors, where no corresponding service or value is rendered or liability created.
3. From sale of capital assets.
4. From profits or income earned in operation of the business.
5. From writing up book value of assets.

II. **Display of Surplus** involves its proper subdivision by indentation or otherwise so that its origin, appropriation, etc., are duly indicated. In the balance sheet amount available for dividends should be shown. **Three possible places to show reserves** on balance sheet are:

1. As direct deduction from assets to which they definitely apply.
2. As part of analysis of surplus portion of proprietorship.
3. As liabilities.

Inclusion of capital stock obligations with permanent liabilities is giving place to the method wherein all proprietorship measurements are grouped together in the balance sheet, cumulating in a total which displays in one amount net excess of all assets over liabilities.

---

[4] *The Accountant*, Oct. 28, 1922, p. 611 *et seq.*

In case of **par-value stock,** this total usually consists of items representing capital stock plus surplus items, or minus deficits, if there be any. Usually it is given a definite designation, as, **book value of capital stock** or **net worth.**

Consideration must be given to relative interest of each group of stockholders in each classification of surplus. **Preferred stockholders** may have no dividend rights whatever in paid-in surplus, if such surplus came from common stockholders only. Amount of earned surplus applicable to preferred stock depends on character and amount of preference, whether cumulative or non-cumulative, participating or non-participating, and amount already paid them in dividends since preference became effective.

Aside from **contractual obligations,** boards of directors have practically free control over surplus. They may set aside certain portions of it for certain purposes, as **Reserves for New Equipment, Reserves for Contingencies,** etc., thus impounding that amount of surplus and rendering it unavailable for dividend purposes. This impounding is often more apparent than real. Usually by vote they may revoke any previous action unless other persons are definitely a party thereto. This is frequently overlooked.

Definite impounding of surplus may at times prove undesirable. Occasion may arise when credit would be impaired and creditors' rights imperiled unless dividends are paid regularly. To do this may necessitate keeping surplus unappropriated.

Surplus arising from revaluation of appreciated assets should be designated separately, as **surplus from appreciation,** and should be definitely separated from other classes of surplus. Assets thus appreciated must be given special treatment under depreciation. Depreciation must be divided into two parts: That applicable to original cost is a charge to income; that applicable to the appreciated part is a deduction from surplus from appreciation.

Surplus arising from **stock donations,** if no inflation exists, is true paid-in capital surplus, representing a contribution of value by stockholders in excess of capital stock issued therefor.

Undistributed earnings applicable to **no-par stock** should be carried to a surplus account; although some have advocated carrying it direct to **Capital account.** If no-par stock is reacquired at a price different from that issue, surplus is affected. Repurchase at an amount in excess of issue price reduces surplus accordingly, and vice versa. If issued at a variety of prices, the Capital account divided by number of shares outstanding gives **average value** of all stock issued. Some advocate use of this average value in determination of premium or discount on reacquired stock. Others advocate use of price at which the particular shares reacquired were issued.

In **consolidated balance sheets** the asset item of investment representing purchase of stock in subsidiaries must be eliminated. In its place appear actual assets and liabilities of company whose stock was purchased. Amounts so substituted seldom agree with purchase price. Any difference necessarily affects consolidated surplus. If, in lieu of the investment assets, net assets of greater book value are brought into the balance sheet, Surplus account is increased by amount of this excess. It is decreased if substituted net assets are less than the investment assets. This change in surplus represents net earnings or loss applicable to the investment and accumulated since date of purchase. Any difference between price and book value of net assets so acquired at that date is covered by an adjustment in **Good-Will.** Surplus may also be affected by adjustment of intercompany items and elimination of intercompany profit in the inventory. See section on "Consolidations."

Reorganization and Receivership

PURPOSES OF REORGANIZATION.—Cook[5] gives three things that may be accomplished by corporate reorganization:

1. Rearrangement of stocks and bonds as to amount, income, or priority.
2. Sale of property to a new corporation for new stocks and bonds.
3. Sale of property by mortgage foreclosure, purchaser buying for himself and such of old stockholders and bondholders as he may associate with him.

REORGANIZATION BY AGREEMENT.—Reorganization by agreement is of two kinds: (1) a readjustment of rights of interested parties—stockholders and creditors; (2) formation of a new corporation and sale of property and business of old corporation to it in return for its securities.

Reduction of stock is a frequent object of reorganization by agreement.

Illustration.—The Harkness Automobile Co., according to its own statement as of June 30, 19—, has $1,000,000 of preferred stock and $3,000,000 of common stock outstanding. Both preferred and common shares are of $100 par value. The surplus amounts to $1,045,000, and among the assets is $1,000,000 of good-will. An audit of books made as of the same date shows obsolete properties, doubtful accounts, and valueless investments to amount of approximately $1,000,000 to be written off. Good-will, however, is left untouched. Following statement based on such valuation is submitted by accountants, showing surplus reduced from $1,045,000 to $45,000.

Harkness Automobile Company and Branches
Balance Sheet as at June 30, 19—
(Before reduction of capital)

Assets		Liabilities	
Cost of Properties and Equipment, including Good-Will	$ 4,500,000	Capital Stock:	
		Preferred	$ 1,000,000
		Common	3,000,000
Securities Owned, of Subsidiary and Other Companies	1,300,000	Bonds Outstanding	2,500,000
		Short-Term Notes	500,000
Sinking Fund Deposit	220,000	Accounts Payable	1,525,900
Cash	235,000	Notes Payable	490,000
Accounts Receivable	1,172,300	Accrued Items	31,200
Notes Receivable	1,370,000	Bond Interest, payable July 1, 19—	62,500
Material, Supplies, and Finished Parts	981,600	Dividend Declared and Unpaid	120,000
Contract Work in Course of Construction	476,300	Sundry Operating Reserves	189,000
Accrued and Prepaid Items	58,400	Indorsement on Notes Discounted	850,000
		Surplus	45,000
	$10,313,600		$10,313,600

5 Corporations, §883.

Stockholders now decide to write off the good-will of $1,000,000 and to add $500,000 to surplus, by reducing the common from $3,000,000 to $1,500,000. Cumulative preferred stock is to remain as before.

Entries to Reduce Stock.—Since new common stock certificates when issued are for one-half number of shares canceled, so that each holder thereof will own 50% of former holdings, each stockholder's account in the stock ledger should be debited with number of shares canceled, and new certificates reissued for balance, old ones being taken up. Another plan is to debit each account for entire number of former shares to close the account, after which the account is credited with actual number of new shares issued. Only entry in general ledger is one to adjust **Capital Stock, Surplus,** and **Good-Will** as follows:

Capital Stock—Common....................	$1,500,000	
Good-Will (or Plant)..................		$1,000,000
Surplus............................		500,000
To record requirements of charter amendment granted this day, reducing number of shares of stock from 30,000 to 15,000 of par value of $1,500,000.		

This cancels **Good-Will account** and creates additional surplus of $500,000, the total now amounting to $545,000.

Status after Reorganization.—Reduction in total par of common stock does not mean that company's net worth is less than formerly, or that a holder of stock has lost anything by charter amendment. Net worth of company is now $3,045,000, as it really was before. Each of 15,000 shares of common stock has book value of $136.33, found by dividing their total book value of $2,045,000 by total number of shares. Book value of preferred stock remains at $100 per share.

REORGANIZATION THROUGH RECEIVERSHIP.—A **receiver** is a fiduciary.[6] No prescribed form of accounts is required to be kept by the receiver. Availability of data is chief consideration. Receiver must state assets and liabilities of company at beginning and end of receivership, and the intervening transactions, in form of statements to the court. These become public records. Forms followed in illustration below require modification in some states. In others there are no specific requirements as to form of accounts. (Note.—See discussion of receivership in section on "Bankruptcy, Insolvency, and Receivership.")

Usually the **general books** of the company are continued as usual until outcome of receivership is known; but they may be adjusted to conform to new conditions. If kept in agreement with books of receiver, adjusting entries are required. One of these charges the receiver with assets taken over by him, debit balance to receiver's account remaining until end of receivership. When assets and liabilities are turned back at end of receivership, if business is to be continued, receiver is credited with net worth thereof, assets being charged and liabilities credited. Amount of charge in receiver's account is adjusted to Surplus; this measures profit or loss during receivership.

The receiver's first step is to take an **inventory and appraisement** of the estate, known as a **statement of affairs.** This is accompanied by a **deficiency account,** showing the capital impairment and its causes. The statement of affairs is prepared from all available information—books, schedules, claims of creditors, etc. In it **liabilities** are distinguished as to unsecured, partially

[6] For discussion of general principles of **fiduciary accounting** see section on "Fiduciaries."

secured, and secured. Contingent liabilities are included. **Assets** are shown at nominal or **book value,** also at **expected to realize** value. **Assets pledged as security** for creditors' claims are separated from unpledged assets. This statement is submitted to the creditors. The **inventory and appraisement** is recorded in the court journal.

Statement of affairs is illustrated as follows. The Excelsior Harvester Co., unable to meet its obligations, goes into receiver's hands July 1, 19—. State-

Statement of Excelsior Harvester Company
At beginning of Receivership, July 1, 19—

ASSETS			Book Value	Appraised Value
Real Estate, Plant, etc.		$12,136,500		
Less: Reserve for Depreciation		897,510		
		$11,238,990		
Less:

Capital Stock—Preferred, 7% Cumulative	5,000,000	
Capital Stock—Common	5,000,000	
Balance—Excess of Assets over Liabilities, being the Net Worth of the Corporation	....	10,366,750
Total	$16,797,240	$15,121,140

* Notes under discount at bank, $400,000 additional.

FORM 9. Statement of Affairs

ment of affairs is given in Form 9. Equities only are shown in the appraisal, secured liabilities being deducted from assets pledged or mortgaged. Bonds and cash held by trustees are deducted from the corresponding liabilities and the net liability from value of mortgaged assets. Also, collateral trust bonds are deducted from value of pledged securities.

Receiver's appraisal and statement made upon his appointment, July 1, 19—, reveals following conditions:

1. Real estate and plant valuation should be reduced $600,000.
2. Investments have declined $500,000 below book value.
3. Merchandise inventory should be reduced to $2,100,000.
4. Accounts receivable would probably realize $3,200,000.
5. Notes receivable are doubtful to extent of $422,000.
6. $60,000 of notes under discount are likely to be dishonored.
7. $30,000 for dishonored notes of a customer have been charged to company's account by the bank.

Receivership is terminated Dec. 31, 19—, when reorganization occurs. Statement of receiver at date of withdrawal, after 6 months' tenure, follows. It shows adjustments as suggested in statement to the court, also following transactions during his incumbency:

1. $1,200,000 of 6% receiver's certificates issued, due in 4 months, dated Aug. 1, sold at 98.
2. Building extensions previously begun were completed at cost of $500,000, by order of court.
3. Factory was kept running at considerable reduction in capacity.
4. Goods were sold from stock at best prices obtainable, bringing $287,680.
5. $1,724,440 accounts receivable collected.
6. $1,050,880 notes receivable collected, of which $75,000 was applied to notes written off as doubtful.
7. $81,100 paid for accrued taxes and labor.
8. $268,200 expended in cash for material for use in factory.
9. Expenses paid in cash, $76,500; legal fees, $22,500; and amount drawn by receiver upon authority of court, $10,000.

Receiver's accounting records should be independent of company's books. If he retains the accounting staff of the company, he may keep his records in company's loose-leaf binders. Ordinarily receiver's books, as he opens them, do not show company's liabilities until proper proofs of claim are filed with him and allowed by him. He begins his accounts with an inventory of assets only.[7] Debts appear only through payment, or allowance by receiver if he desires to show claim allowed on books.

Receiver opens separate books by making a journal entry setting up assets at appraised value. Appraisal and audit, July 1, 19—, shows reduction of $1,676,100 in value of assets, made up of following items:

Real Estate and Plant	$ 600,000
Investments	500,000
Merchandise	78,960
Accounts Receivable	45,140
Notes Receivable	422,000
Cash in Banks	30,000
	$1,676,100

7 See Wills, Estates and Trusts, by Conyngton, Knapp, & Pinkerton, p. 588.

In order not to lose sight of notes and accounts receivable appraised at nothing or less than par, entire previous book value of such items is entered. An **Allowance for Doubtful Receivables** account is set up for the difference. Thus subsidiary ledgers show all receivables and continued efforts are made to collect them. Failure to realize upon bad ones is not a reflection on receiver, however. Dishonored note deposited by company before receiver took charge also is entered as a receivable, and included in the amount of the reserve. Deposits of cash and securities with trustee of sinking fund and securities for collateral trust bonds are omitted from assets with which receiver charges himself, because they have left the company's control and are in trustee's hands for a specific purpose. As an offset to value of all assets taken over, receiver credits Excelsior Harvest Co. with appraised value of these assets.

Receiver's opening entry is:

Real Estate, Plant, etc.	$6,435,190	
Merchandise Inventory	2,100,000	
Accounts Receivable	3,245,140	
Notes Receivable	2,892,100	
Cash on Hand and in Banks	945,850	
Allowance for Doubtful Receivables		$ 497,140
Excelsior Harvester Co.		15,121,140
To record appraised values of assets and liabilities of Excelsior Harvester Co., in receivership, taken over this day by decree of court.		

Receiver's transactions require opening such nominal accounts as **Sales**, etc. To make the record brief, almost all items of expense are here entered in one **Expense account.** In practice the accounts should be detailed enough to provide a complete classification. Receiver must keep a complete record of all activities to enable him to account correctly to the court. The **cash book** will receive most of the entries, but certain ones may be entered in the journal. Result of cash entries is summarized thus:

Receiver's Cash Account

(Being a record of his transactions from July 1, 19—, to December 31, 19—)

Receipts		Payments	
Balance Turned over to Receiver	$ 945,850	Discount on Receiver's Certificates	24,000
Receiver's Certificates	1,200,000	Real Estate Operations	500,000
Merchandise Sales	287,680	Accrued Charges	81,100
Accounts Receivable	1,724,440	Merchandise Purchases	268,200
Notes Receivable	975,880	Expensés	76,500
Notes Receivable (Doubtful)	75,000	Legal Expenses	22,500
		Salary of Receiver	10,000
		Receiver's Certificates Paid	1,200,000
		Interest on above	24,000
		Balance of Cash on Hand	3,002,550
	$5,208,850		$5,208,850

Form 10. Receiver's Cash Account

The receiver's journal entries, condensed, are:

Excelsior Harvester Co.	$4,754,390	
Claims Allowed		$4,754,390
Recording claims properly presented to receiver and regularly allowed.		
Merchandise Inventory	$ 50,000	
Cost of Sales	218,200	
Merchandise Purchases		$268,200
Bringing Merchandise Inventory account to proper figure and charging balance of purchases into Cost of Sales.		
Allowance for Doubtful Receivables	$75,000	
Recoveries on Doubtful Receivables		$75,000
Charging against reserve amount collected on doubtful note of		

The **trial balance** of the receiver's books, before closing Dec. 31, 19—, but after all above transactions are posted, is:

Trial Balance, December 31, 19—

Real Estate, Plant, etc.	$ 6,935,190	
Merchandise Inventory	2,150,000	
Accounts Receivable	1,520,700	
Notes Receivable	1,841,220	
Cash on Hand and in Banks	3,002,550	
Allowance for Doubtful Receivables		$ 422,140
Excelsior Harvester Co.		10,366,750
Claims Allowed		4,673,290
Discount on Receiver's Certificates	24,000	
Cost of Sales	218,200	
Expenses	76,500	
Salary of Receiver	10,000	
Legal Expenses	22,500	
Interest on Receiver's Certificates	24,000	
Merchandise Sales		287,680
Recoveries on Doubtful Receivables		75,000
	$15,824,860	$15,824,860

The **closing entries** on the receiver's books, made at termination of his activities but before the reorganization, are:

Merchandise Sales	$ 287,680	
Cost of Sales		$ 218,200
Profit and Loss		69,480
Closing merchandising accounts and showing gross profit on sales.		
Recoveries on Doubtful Receivables	$ 75,000	
Profit and Loss		$ 75,000
Closing former account to show gain on realization over appraised value of assets.		
Profit and Loss	$ 157,000	
Discount on Receiver's Certificates		$ 24,000
Expenses		76,500
Salary of Receiver		10,000

Legal Expenses		22,500
Interest on Receiver's Certificates		24,000
Closing expense accounts.		
Excelsior Harvester Co.	$ 12,520	
Profit and Loss		$ 12,520
Charging the net loss of period against the value taken over by the receiver.		
Allowance for Doubtful Receivables	$ 422,140	
Claims Allowed	4,673,290	
Excelsior Harvester Co.	10,354,230	
Real Estate, Plant, etc.		$6,935,190
Merchandise Inventory		2,150,000
Accounts Receivable		1,520,700
Notes Receivable		1,841,220
Cash on Hand and in Banks		3,002,550
Closing the books of the receiver and showing the assets and liabilities turned back to Excelsior Harvester Co.		

The **receiver's statements to the court** may consist of but one account or statement, known as **first and final account,** or it may consist of several state. ments or accounts. The court usually appoints an auditor to pass upon th- receiver's accounts in detail and to report before any distribution of assets is made. The auditor places notices in newspapers announcing that he will sit on a certain date to receive claims and hear complaints on the audited statement. This hearing may be adjourned one or more times. From statement presented by receiver the auditor usually makes up a briefer statement of his own, reciting in brief the receiver's activities introductory to the audited statement. This is filed with the court as a permanent record.

A **satisfactory form of general statement of account** as rendered by the receiver is shown in Form 11, although this may require modification to meet special requirements in some states. Sometimes specific forms are required by statute. Predilections of the judge to whom the statement is to be submitted should be taken into consideration.

This statement is supported by **exhibits** and **schedules.** These include a balance sheet, statement of profit and loss from operations, summary of case account, lists of claims allowed but not paid, and of claims allowed and paidh Satisfactory forms for the more important of these are found below.

The **receiver's balance sheet** at time of closing, showing results of all his transactions, is given in Form 12.

In addition to the exhibits and schedules indicated above, it is sometimes desirable to set up an analysis of receiver's equity, or his account with the company for which he acts as receiver. The summary of cash account may be as shown in Form 10, or opening balance and later receipts may be listed at top of page and disbursements at bottom, total of latter being subtracted from total of former to secure closing balance. A **form for analysis of receiver's equity** is shown in Form 13.

Adjustment of company's books may be made at both beginning and end of receivership, or only at end. If only at end, no entries are made until time of reorganization, when the abandoned accounts are adjusted to new conditions.

Illustration.—Assuming, in case of Excelsior Harvester Co., that accounts are to be adjusted at both beginning and end of receivership, at beginning the following entry is made to adjust asset values:

July 1, 19—

Surplus	$1,736,100	
Real Estate, Plant, etc.		$600,000
Investments		500,000
Merchandise, etc.		78,960
Accounts Receivable		45,140
Notes Receivable		422,000
Cash		30,000
Notes under Discount		60,000
To adjust losses and shrinkage in assets, per appraisement of receiver.		

First and Final Account of the Receiver for
Excelsior Harvester Company
December 31, 19—

DEBITS			
THE RECEIVER CHARGES HIMSELF AS FOLLOWS:			
Inventory and Appraisement of Assets taken over July 1, 19—:			
Equity in Real Estate, Plant, etc.		$6,435,190	
Equity in Investments of Subsidiary Companies.		(none)	
Merchandise Inventory		2,100,000	
Accounts Receivable		3,200,000	
Notes Receivable		2,440,100	
Cash on Hand and in Banks		945,850	
Total Assets taken over			$15,121,140
Additions to Capital:			
For Outlay Increasing Value of Real Estate and Properties		$ 500,000	
Increase in Cash, per Cash Account		2,056,700	
Increase in Value of Merchandise		50,000

Notes Receivable*			1,464,220
Cash on Hand and in Banks			3,002,550
Total			$15,027,520
LIABILITIES			
Bank Loans Unsecured		$ 500,000	
Notes Payable		1,490,500	
Accounts Payable		2,375,640	
Accrued Charges		247,150	
Claims on Notes under Discount		60,000	
Total Liabilities			4,673,290
Receiver's Equity, Excess of Assets over Liabilities			$10,354,230

* Notes under discount at bank, $400,000 additional.

Form 12. Receiver's Balance Sheet

Analysis of Receiver's Equity

Equity at beginning of receivership		$15,121,140
Loss from operations	$ 12,520	
Claims allowed	4,754,390	
Total deductions		4,766,910
Equity at termination of receivership		$10,354,230

Form 13. Analysis of Receiver's Equity

This reduces company's surplus from $2,102,850 to $366,750, which with capital stock of $1,000,000 makes net worth of $1,366,750 shown by appraisal.

Next **closing entries** are made by charging receiver with equity in assets taken over, thus:

July 1, 19—		
Receiver	$15,121,140	
Real Estate, Plant, etc.		$6,435,190
Merchandise Inventory		2,100,000
Accounts Receivable		3,200,000
Notes Receivable		2,440,100
Cash on Hand and in Banks		945,850
To record transfer of company's assets to the receiver, as per order of the court.		

Receiver's account in company's ledger now shows debit balance of $15,121,140, corresponding with amount of his account with company in receiver's ledger.

Company's accounts, after transferring assets to receiver, are as follows:

Trial Balance, July 1, 19—

Receiver	$15,121,140	
Real Estate, Plant, etc.	5,101,310	
Sinking Fund Investments	2,000,000	
Sinking Fund Cash	296,200	
Investments in Affiliated Companies	4,000,000	
Reserve for Depreciation		$ 897,510
First Mortgage Bonds Outstanding		6,500,000
Collateral Trust Bonds Outstanding		4,000,000
Bank Loans Unsecured		500,000
Notes Payable		1,490,500
Accounts Payable		2,375,640
Accrued Charges		328,250
Notes under Discount		60,000
Capital Stock—Preferred		5,000,000
Capital Stock—Common		5,000,000
Surplus		366,750
	$26,518,650	$26,518,650

Liabilities are not credited to receiver on company's books under above plan. Usually, however, he is credited with them as he reports to court that he has approved the claims. This keeps company's account with receiver in agreement with receiver's account with company. Such entry would be in following form:

Bank Loans Unsecured	$ 500,000	
Notes Payable	1,490,500	
Accounts Payable	2,375,640	
Accrued Charges	328,250	
Notes under Discount	60,000	
Receiver		$4,754,390
Crediting receiver with claims allowed by him and closing those accounts on the company's books.		

As receiver pays off liabilities, he should be credited on books of company.

Profit or loss shown by each report approved by the court should be entered

on company's books, so that following each such report **receiver's account** on company's books will equal amount shown by receiver's account with company. This entry is taken from receiver's operating statement, as follows:

Discount on Receiver's Certificates	$ 24,000	
Cost of Sales	218,200	
Expenses	76,500	
Salary of Receiver	10,000	
Legal Expenses	22,500	
Interest on Receiver's Certificates	24,000	
Merchandise Sales		$287,680
Recoveries on Doubtful Receivables		75,000
Receiver		12,520
Recording operations of the receiver and crediting his account with the loss sustained.		

Entries of this kind accumulate on books until close of company's fiscal period, when income and expense accounts so opened are closed into Profit and Loss and thence into Surplus. In present instance, if company's ordinary closing date is Dec. 31, entry made above is immediately reversed, except that $12,520 credited to receiver is in the reversal charged to Profit and Loss.

At close of receivership, assets may be taken back into ledger accounts; or, as is more customary, assets may not be taken back until reorganization is effected, when various adjustments should be made to reopen ledger in accordance with conditions. But if desirable to bring in assets and liabilities as shown by receiver's final statement, reorganization adjustments being made later, following is form of journal entry:

Real Estate, Plant, etc	$7,832,700	
Merchandise Inventory	2,150,000	
Accounts Receivable	1,475,560	
Notes Receivable	1,464,220	
Cash	3,002,550	
Bank Loans Unsecured		$ 500,000
Notes Payable		1,490,500
Accounts Payable		2,375,640
Accrued Charges		247,150
Reserve for Depreciation		897,510
Notes under Discount		60,000
Receiver		10,354,230
To record existing assets and liabilities on books of the company on termination of receivership (preceding the reorganization adjustments).		

RECEIVERSHIP AND SALE.—If a reorganization cannot be effected, it becomes the receiver's duty to sell enough property to pay (1) expenses of receivership and sale, and (2) creditors of the corporation. If sale of part of assets will put corporation in a solvent position, that will be sufficient. Unsold assets revert to corporation; also any cash remaining from sale of assets after necessary obligations are paid. Principles of accounting are, in general, the same as in preceding illustration. For a detailed illustration of procedure when receiver makes his entries on books of company, see "Corporation Procedure" by Conyngton, Bennett, and Pinkerton, pp. 1331–1348. Also, for further discussion of receivership accounting see section on "Bankruptcy, Insolvency, and Receiverships."

SECTION 5

NET INCOME AND SURPLUS

CONTENTS

(For list of forms, see complete table of contents.)

SECTION 5

NET INCOME AND SURPLUS

DETERMINATION OF NET INCOME.—The determination of net income begins with the accounting for revenue. Revenue is **operating** and **non-operating.** Operating revenue is that derived rom activities for the carrying on of which the business is established. Non-operating revenue is that derived from other sources. From total revenue must be deducted the various expenses of operation, maintenance, and administration in order to arrive at **net** income. The method of showing the various items of income and the deductions therefrom depends upon the character of the enterprise and the accounting methods which have been developed to show results.

Two illustrations of profit and loss or income statements are given below. The first is the profit and loss statement given in the Harvard System of Accounts for Retail Grocers. The second is that of the Brooklyn Edison Co. for the years 1920–1921, and illustrates a form of income statement of a corporation. These are typical of good practice and indicate how, under different conditions, net profit or net income is derived.

The sources of gross earnings as well as the deductions therefrom are determined by the character of the business. These should be classified according to a logical analysis. Gross earnings should be classified on the basis of sources of derivation. Deductions from gross earnings should be classified on the basis of their relationship to the operating cycle. In a manufacturing business the natural order and description of deductions from gross income is:

1. Manufacturing expense
2. Selling expense
3. Administrative expense

Until these deductions have been made, there is no place in the scheme of arrangement to add income other than operating. Having arrived at operating income by deducting manufacturing, selling, and administrative expenses, total net income is secured by adding to operating net income, income from other sources. From total net income are deducted the fixed charges—taxes, interest, etc., leaving net income as a result. The details as to content and arrangement must be determined by the nature of the enterprise.

Terminology should be adopted which best expresses the facts. In so far as possible this should follow standardized practice. Regarding income and expense items there is still great lack of uniformity in terminology. The terms **profit, income, revenue,** and **earnings** are used synonymously. Sometimes the expression "income available for surplus and reserves" is used to signify a sum from which depreciation and depletion reserves are to be provided. Usually **net profits** means that depreciation has been deducted; this is less frequently true of **net earnings.** It may therefore be improper to compare "net earnings" of one concern with "net profits" of another.

Surplus for Year	255,074.65	153,353.24
Surplus at Beginning of Year	3,542,756.05	3,629,881.00
Less: Adjustments for Previous Years	156,345.02	240,478.19
Adjusted Surplus	3,386,411.03	3,389,402.81
Surplus at End of Year	3,641,485.68	3,542,756.05

FORM 2. Comparative Income Statement—Brooklyn Edison Co., Inc.

The following definitions are from Montgomery's "Auditing, Theory and Practice":[1]

Gross income means accruals (as distinguished from cash receipts) from all sources, such as sales, rentals, and interest; profits derived from the sale of capital assets, and the excess of previously created reserves over the ascertained need for such reserves.

Net income means the balance of income remaining after deducting from gross income all costs, charges, and expenses (including items accrued but not paid and losses arising from the sale of capital assets).

Montgomery also suggests the following classification of deductions from gross income:

[1] Vol. I, pp. 299, 300

1. Current charges against income, such as cost of goods; cash discounts; allowances not fairly deductible from sales prices; selling, general, and administrative expenses; bonuses to officers and employees; bad accounts and reserves for doubtful accounts; adequate depreciation (when not included in cost of goods), depletion and ordinary obsolescence (if there is such a thing); insurance; proportion of deferred charges carried over as applicable to the current period (if not absorbed—as they should be—in the accounts to which they relate); property and similar taxes paid, accrued, or estimated; and any other charges and expenditures properly chargeable to current operations.
2. Deductions from gross income for interest paid and accrued on borrowed money (but not interest on capital), federal and state income taxes, accrued or estimated.
3. Losses arising from sale of capital assets, and other extraordinary items affecting prior periods.

Legal definitions of net income vary widely. The following is from *Doyle* v. *Mitchell Bros. Co.*:[2]

Whatever difficulty there may be about a precise and scientific definition of "income," it imports, as used here, something entirely distinct from principal or capital either as a subject of taxation or as a measure of the tax; conveying rather the idea of gain or increase arising from corporate activities. As was said in *Stratton's Independence* v. *Howbert*, 231 U. S. 399, 415; 58 L. Ed. 285, 292; 34 Sup. Ct. Rep. 136: "Income may be defined as the gain derived from capital, from labor, or from both combined."

Understanding the term in this natural and obvious sense, it cannot be said that a conversion of capital assets invariably produces income. If sold at less than cost, it produces rather loss or outgo. Nevertheless, in many if not in most cases there results a gain that properly may be accounted as a part of the "gross income" received "from all sources"; and by applying to this the authorized deductions we arrive at "net income." In order to determine whether there has been gain or loss, and the amount of the gain, if any, we must withdraw from the gross proceeds an amount sufficient to restore the capital value that exists at the commencement of the period under consideration.

An **accounting definition** is given by Montgomery:[3]

The term "net income" should be used only to designate the amount arrived at by stating the income actually accrued during a stated period, collected or collectible, less the cost thereof actually paid, and less further costs accrued but not paid, such as depreciation, obsolescence, taxes, and other charges apportioned against the income, such as reserves for strikes, workmen's pensions, etc. Reserves for working capital, unknown contingencies, etc., are not costs, but reservations of profits, and so are not to be considered in determining net income.

NATURE OF SURPLUS.—Net income may be retained in the business or be distributed to the owners. If retained it is added to the capital accounts of partners or sole proprietors, and to surplus of corporations.

Surplus, in its common use, consists of the accumulated undivided profits of the business. Sometimes, however, it is derived from sale of stock above par, from sale of capital assets, or from a revaluation of assets, in which case it is **capital surplus.**

Surplus and **original investment** are usually distinguished by more or less arbitrary methods. Theoretically the Capital Stock account represents original investment of stockholders; but when stock is sold above par, the excess, although part of the investment, is considered under the title of Capital Surplus, being entered in a separate account. Laws make the distinction rather arbitrarily, in attempting to prohibit the impairment of capital, by protecting an amount equal to par value of stock issued in case of corporations with par-value shares. These laws do not prohibit impairment of capital in excess of par of stocks; yet such excess, by being given a distinct classification, is ordinarily removed from surplus applicable to payment of dividends.

---

[2] 247 U. S. 179.
[3] Auditing, Theory and Practice, Vol. I, p. 309.

In case of **banks** and **trust companies** it is the custom to sell stock at a premium to reduce the amount of capital stock and therefore the total amount of the double liability frequently imposed by law on the par value of stockholders' shares, the aggregate amount of which is necessarily reduced when stock is sold at a premium instead of at par. The surplus thus arising is not intended for distribution as dividends. In case of sale of **no-par stock,** no uniformity in practice exists as to what part of proceeds is investment and what is surplus. The statutes of the state of incorporation should be investigated on this point. Where statutes place a dollar value on no-par shares, accountants frequently treat this as par value, any excess received above this amount being regarded as surplus. Best practice is to credit No-Par Capital Stock account for entire amount received from sale of stock, regardless of any arbitrary valuation placed thereon.

Original investment plus net earnings less withdrawals equals **capital** or **net worth.**

Analysis of surplus is necessary to show what part is investment and what part represents earnings. In any case mere size of surplus is not a certain index of earnings, because part or all of it may have resulted from sale of stock at a premium and because it may have been reduced by dividend payments.

Surplus is not represented by any specific assets, although it is sometimes customary to assume that it is when a part thereof is said to be invested in securities as a reserve for contingencies. But such securities are no more a part of surplus than are other assets. Surplus cash, not surplus, is what is invested. Usually there is not enough cash on hand to equal surplus because excess of assets over liabilities and capital takes the form of investment in new plant. Surplus accumulates from day to day although it is entered on the books only when they are closed.

POLICY REGARDING SURPLUS.—A large surplus serves as a bulwark against hard times and enables a corporation to pursue a consistent dividend policy. This tends to create a good credit rating. Frequently the dividend rate is fixed at a figure slightly below estimated minimum earnings, thus making certain of regular dividend payments and more or less constant additions to surplus. This policy is especially desirable where income fluctuates widely, because in such cases a larger surplus is desirable than where income is stable.

Surplus is a source of additional capital used for making betterments. It provides a most conservative means of financing because it creates no new obligations. It is the most common method in use of increasing invested capital of corporations. The National Banking Act provides that banks, every 6 months, shall set aside 10% of net profit of preceding half-year as a permanent addition to surplus until amount so set aside reaches 1/5 of par of capital stock.

In some cases the amount of surplus which can be employed in creating additions and betterments is very limited. After all reasonable requirements have been met, any excess of surplus remaining should be distributed to the stockholders as dividends.

When surplus becomes disproportionately large, it is sometimes decided to declare a **stock dividend,** by which capital stock is increased and surplus decreased by equal amounts. Four chief purposes of stock dividend declarations are:

1. To satisfy stockholders who clamor for the distribution of surplus without reducing capital or cash.
2. To give stockholders tangible evidence of increased value of their holdings.

3. To keep market price of stock at a satisfactory figure.
4. To conceal large earnings by distributing them at a lower rate over a larger amount of capital stock.

A **deficit** results when charges to Surplus exceed credits; when such transformation occurs the name of the account may be changed from "Surplus" to "Deficit." An alternative procedure is to adopt the name "Surplus and Deficit," which applies to either situation. In balance sheets deficits should always be so labeled.

Extraordinary gains and losses should be carried direct to Surplus or to a separate division of profit and loss, so that results will not be vitiated for comparative and statistical purposes. Such separate section is necessary if the item is carried to profit and loss, because the ordinary Profit and Loss account should be used only for clearing normal items of income and expense. The chief objection to entering such items direct to Surplus is that it is then made a dumping ground for all sorts of unusual items. Another objection to entering such items directly in Surplus is in the resulting greater difficulty of making reconciliation or proof of Profit and Loss and Surplus required in corporate income tax returns. The Bureau of Internal Revenue expects all items affecting profit of year to be handled through Profit and Loss, so that book profit may be proved by adding back to taxable income items of income not taxable and subtracting expenses not deductible. When charges are made direct to Surplus an awkward adjustment is required. The form of reconciliation is as follows:

Net Taxable Income		$ 43,271.10
Non-Taxable Income:		
Interest on Liberty Bonds		44.00
Other items		none
Total		$ 43,315.10
Unallowable Deductions:		
Donations	$ 160.00	
Income and Profits Taxes Paid	12,362.64	
Other items	none	
Total		12,522.64
Net Profit per books		$ 30,792.46
Surplus at beginning of year		122,360.62
Other Credits to Surplus during year		none
		$153,153.08
Dividends paid	$20,000.00	
Other debits to Surplus	none	
Total		20,000.00
Surplus at close of year		$133,153.08

CREDITS TO SURPLUS.—The chief credits to Surplus are:

1. To record net profit at end of fiscal period.
2. To record increases in net profit applicable to a previous period.
3. To record unusual profits.
4. To record premiums received on sale of capital stock.

5. To adjust increased valuations of fixed assets.
6. To show forfeitures on payments on capital stock subscriptions.
7. To record assessments on capital stock.
8. To record difference between par value of reductions of capital stock outstanding and recompense paid to holders when redemption is at less than par. In case such stock is held for resale the excess of par over purchase price should be carried in an unearned surplus account until actually realized.
9. To record excess in value of tangible assets over par of stock issued therefor.
10. To record profit on sale of treasury stock repurchased for value.
11. To record donations received.

DEBITS TO SURPLUS.—The chief debits to Surplus are:

1. To record net loss at end of fiscal period.
2. To record decreases in net profit applicable to a previous period.
3. To record unusual losses.
4. To record discounts received on sale of capital stock.
5. To adjust decreased valuations of fixed assets.
6. To record amount of dividends declared.
7. To record premiums paid when capital stock is redeemed.

CLASSIFICATION OF SURPLUS.—Fundamentally surplus is divisible into **earned surplus** and **capital surplus.** When the word "surplus" occurs without qualification, **earned surplus** is usually understood, but it is employed to cover both earned and capital surplus above. Earned Surplus is credited with earnings from normal sources and for adjustments increasing the profit of a previous period. It is charged with net losses from normal sources and for adjustments decreasing the profit of a previous period; also for dividends declared.

Undivided Profits account may form a subdivision of Earned Surplus. Sometimes, however, it takes the place of Earned Surplus. Usually it is the account to which earnings are first transferred and from which occasional transfers are made to Surplus. Sometimes it is used as an account in which are carried undistributed or unappropriated profits of last closing, undivided profits of preceding periods being taken to Surplus.

Capital Surplus comprises all surplus not derived from ordinary operations, and is classified as:

1. Unusual or extraneous profits.
2. Premium on sale of capital stock.
3. Forfeited payments on stock subscriptions.
4. Assessments on full-paid stock.
5. Amount by which redemption price of stock retired is less than par.
6. Excess of value of tangible property over stock for which it is received in payment.
7. Profit on sale of treasury stock repurchased for value.

Items 2–7 constitute **paid-in surplus.** Reductions of capital surplus result from debit entries recording conditions just the opposite of those which give rise to above items. All but items 1 and 7 constitute varying kinds of premium on sales of stock. Sometimes such items are carried in **Premium account.** Such premium is, nevertheless, capital surplus. Intangible property is so difficult to value accurately that it is not usual to create a surplus when it is secured in exchange for stock. Capital surplus arises in reorganizations when par of stock issued is less than par of stock previously outstanding and now retired in exchange for the new.

Treasury Stock consists of both **repurchased** and **donated stock.** Repurchase of stock is regulated by law in some states. Stock may be repurchased below, above, or at par. Treasury stock may be carried on books at cost or at its par value, or, if donated, at either estimated value or par. It is a reduction of capital stock outstanding and on the balance sheet is shown as a deduction from capital stock, thus:

Capital Stock	$400,000
Less: Treasury Stock	50,000
Stock Outstanding	$350,000

Purchase of stock at less than par creates an unearned surplus. In case of donated stock this is equal to par of the stock donated. Stock issued for value and then donated back may be resold at less than par without creating any liability on part of buyer for amount of discount. Since property is often turned in for stock at an inflated valuation, surplus resulting from donation of stock issued in payment therefor may be fictitious. No real surplus exists until donated stock is sold, and then only in case the asset values for which the donated stock was originally issued, were not inflated. But since asset values usually are inflated, it may be better policy to reduce book value of assets than to set up surplus, although to do so may run counter to the action of the board of directors in originally placing a valuation on the assets. If surplus is set up, it should be termed **Donated Surplus** or **Working Capital Surplus.** Surplus from donated stock is merely an unrealized increment until the donated stock is actually sold. Oftentimes the surplus arising from this source is overstated because it has not been reduced by discounts incurred on the stock at time of its sale. At time stock is donated, charge **Treasury Stock** and credit **Donations account.** When donated stock is converted into cash or other assets, any difference resulting from failure to realize its par value should be applied to reducing the amount of the credit balance in the Donations account. After all donated stock is disposed of, the adjusted balance in the Donations account represents net increase in asset values arising from donation of stock and therefore amount of surplus arising from this source. If original assets received in payment for stock issued have been carried at an inflated valuation on the books, this inflation may be eliminated as suggested above by writing it off against the Donations account before that account is transferred to Surplus. Surplus which originates in this way is true paid-in surplus, because it represents a contribution by the stockholders.

Repurchased Stock should be governed by same principles as donated stock. Since it should be carried at par a book surplus results equivalent to the amount of any discount on the purchase price. If repurchased stock is sold at a profit, Capital Surplus is increased by amount of the profit; if at a loss, Capital Surplus is decreased to that extent. The unearned increment is replaced by true surplus or reduction thereof according as stock is sold for more or less than its purchase price. This unearned increment should be termed **contingent profit on treasury stock.** If stock sells below repurchase price, this contingent profit is wiped out and amount of loss is a charge, first, to Capital Surplus and, secondly, to Earned Surplus. Contingent profit exists only if stock is repurchased below par. If stock is repurchased at a discount and authorized capital stock is reduced, the contingent profit becomes capital surplus. This may not be the case, if no reduction in authorized issue is made, since stock might be resold at a discount.

Surplus from Appreciation may result from a revaluation of fixed assets.

A definite line of distinction should be drawn between surplus available for dividends and surplus resulting from such revaluations. Such surplus should be reduced during remaining life of asset to whose revaluation it owes its existence. **Depreciation** of such assets should be separated into two parts, one applicable to original cost, the other to appreciated value. The former part is a charge to income, the latter to Surplus from Appreciation.

Illustration.—A building costs $200,000 and has an estimated life of 40 years. At end of 20 years it is appraised at $150,000, thus increasing the depreciated book valuation $50,000. This entry is as follows:

Building	$50,000	
Surplus from Appreciation		$50,000
To record increase in value, as per appraisal.		

Over remaining 20 years of building's life the newly appraised value of $150,000 must be charged off by an annual charge of $5,000 to income and of $2,500 to Surplus from Appreciation. The entry at end of each year is:

Depreciation	$5,000	
Surplus from Appreciation	2,500	
Reserve for Depreciation		$7,500

SURPLUS IN CONSOLIDATED BALANCE SHEET.—When balance sheets of affiliated companies are consolidated, investment accounts representing intercompany holdings of stock are eliminated and in their place appear the actual assets and liabilities of companies involved. When amounts thus substituted do not agree with purchase price of intercompany holdings of securities, the difference affects **consolidated surplus.** Thus, if in place of the investment account representing securities of affiliated companies held, net assets having a greater book value are brought into the balance sheet, Surplus account is increased by such excess of assets over investments. Likewise Surplus is decreased if net asset values brought into consolidated balance sheet are less than the investment account for which they are substituted. The change in Surplus thus resulting represents net profit or loss which is applicable to the investment and which has accumulated since it was purchased. Any difference between purchase price and book value of assets at date of their purchase should be covered by an adjustment of the **Consolidated Good-Will account.** (See section on "Consolidations.")

RESERVES.—When a part of surplus is set aside for a specific purpose, it becomes a **reserve.** To the word "reserve" it is customary to add a qualifying word indicating the purpose for which the reserve is intended. Reserves of surplus have developed as the result of a desire to show what part of surplus can safely be regarded as being properly available for dividends.

Operating Reserves.—The additions to operating reserves represent charges against Income; consequently they are not reserves of surplus. They show an expense or loss incurred to neglect which would be to overstate net income. They may be an approximation, as in case of depreciation reserves. They represent either a deduction from book value of an asset, as in case of reserves for bad debts and depreciation reserves, or they represent liabilities, as in case of reserves for taxes.

Non-Operating Reserves.—Non-operating reserves are reserves of surplus, representing profit set aside for a more or less definite purpose. Illustrations are sinking fund reserves and reserves for additions and betterments. Such reserves are established by means of an entry debiting Surplus and crediting the proper reserve account. Such entry does not reduce proprietorship but merely segregates part of surplus in a special account. It reserves profits

already realized for some purpose other than dividends. Usually non-operating reserves are established by vote of directors, but they may be the result of contractual obligations with creditors. An illustration of reserves of the contractual type are those providing for redemption of bond issues, details governing the establishment of the reserve, and possibly corresponding fund, being found in the trust deed or mortgage. With such exceptions accounted for, the board of directors has control of surplus disposition. When no contractual obligation exists regarding the integrity of reserves, the board of directors may reverse its policy and turn reserves of surplus already established back into general Surplus. The purposes for which these voluntary reserves are established are summarized as follows:

1. To provide a permanent increase in capital.
2. To provide against emergencies and contingencies.
3. To equalize dividend payments.

APPROPRIATIONS OF SURPLUS.—Integration of surplus on a simple scale is accomplished by separating surplus into two parts, viz., **undivided profits** and **surplus,** the idea being that that portion designated as surplus is to be retained in the business. Where, in case of a large surplus, money is borrowed on the basis of the credit standing which such surplus gives to the company, it may be desirable to take such steps as are necessary to protect such surplus against distribution as dividends. So far as legal rights are concerned, however, the directors are at liberty to make dividend payment from such surplus. In attempting to keep such surplus intact, the interests of the stockholders should not be neglected.

An appropriation of surplus should not be confused with a fund for cash. Merely because surplus has been appropriated in no way indicates that any reservation of a corresponding amount of cash has been made. Usually such reserved surplus exists in the form of increased assets of all kinds. Setting up cash funds to correspond to reservations of surplus is a different matter. As a rule it is not desirable to set up funds to represent non-operating reserves of surplus, because the money can be employed in the business more profitably than in form of securities of other concerns. When, however, it is considered desirable to establish a distinct fund, care should be exercised in purchasing securities for it, to see that they are readily marketable when money is needed.

ACCOUNTING PROCEDURE FOR RESERVES.—In the ledger all reserve accounts show credit balances, but it is not necessary that all reserves appear on the liability side of the balance sheet. Valuation reserves are quite properly a deduction from the book value of the assets to which they are complementary. Examples are reserves for bad debts and depreciation. Operating reserves which show liabilities, such as reserves for taxes, should appear on the credit side of the balance sheet.

Non-operating reserves, being appropriations of surplus, belong in the proprietorship or net worth group of accounts on the liability side of the balance sheet. From point of view of location in balance sheet, reserves are classified thus:

1. Deductions from assets (operating).
2. Accrued liabilities (operating), shown on liability side.
3. Appropriations of surplus (non-operating), shown on the liability side.

On this point Montgomery says:[4]

"The distinction lies in the purpose for which the account is created. If

[4] Auditing, Theory and Practice, Vol. I, p. 267.

the debit or offsetting entries are proper charges against income, then the accounts should be deducted from the assets to which they relate, or else they should be set up as liabilities and should never be grouped with the surplus account. On the other hand, if the accounts represent sums set aside after the net income of an enterprise is properly determined, to conserve its financial interests by reducing the surplus available for dividends, these sums in reality form part of the general surplus of the business. In preparing balance sheets, these latter accounts should be stated as a section of the surplus account."

The ultimate disposition of proprietorship and non-proprietorship reserves differs. The former are ultimately returned to surplus but operating reserves are not if their amounts are correct. This is illustrated below.

Illustration—Operating Reserve.—When an allowance for depreciation is made, a depreciation expense account is charged and a reserve for depreciation is credited. When ultimately the building is displaced, its original cost is charged against the depreciation reserve, and if the reserve has been set up for the correct amount, it will be closed out. Should the reserve prove to be too large or too small, it would be adjusted through Surplus.

Illustration—Non-Operating Reserve.—A reserve is to be set up to provide for the liquidation of a bond issue when it falls due. For this purpose $5,000 of surplus is annually transferred to a Sinking Fund Reserve account until $50,000 has been accumulated in it. The entry each year is:

Surplus	$5,000	
Reserve for Sinking Fund		$5,000

When the bond issue is paid off, Bond account is charged and Cash is credited. As yet the reserve, now amounting to $50,000, is unchanged. This should now be closed into Surplus, thus:

Reserve for Sinking Fund	$50,000	
Surplus		$50,000

The treatment of non-operating reserves should not be confused with the adjustment of operating reserves for excesses and deficiencies over the amount required to serve the intended purpose. Montgomery says that if there is no reasonable chance of reserve being restored to surplus, it is not true surplus reserve.

RESERVES FOR CONTINGENCIES.—Reserves for contingencies may be either operating or non-operating reserves. If the charge for which they are created is a proper deduction from the income of the year in which they are created, they are operating reserves; if not, they are surplus reserves. As a working rule the charge is against current income if there is definite tangible evidence that a liability is accruing, the expense of liquidating which is properly applicable to the current period. This evidence, however, must be something more than a vague feeling that something has been overlooked.[5]

Illustration—Reserve for Contingencies.—In a certain business there is danger of litigation over patented processes although no suits are at present pending. To provide against the possibility of loss on this score, the board of directors decide that it is desirable to reserve a part of surplus which would otherwise be available for dividends. This is done by means of a charge to Surplus and a credit to a Surplus Reserve account. If later a loss is incurred as the result of patent litigation, the cost is charged against this reserve. In any event such losses are proper charges to Surplus and the effect is the same

[5] R. H. Montgomery, Auditing, Theory and Practice, Vol. I, p. 270.

when they are charged against a reserve which was itself a charge against Surplus, as when charged direct to Surplus. The setting up of the reserve simply guarantees the retention of enough surplus to cover such losses. The effect is the same if the cost is charged direct to Surplus and the reserve is transferred back to Surplus as when it is charged to the reserve.

SURPLUS AS AFFECTED BY VALUATION POLICIES.—Over- or under-valuation of assets has an equivalent effect on surplus. The same effect results from the omission of assets or liabilities from the balance sheet, or from the intentional over- or under-statement of assets or liabilities. A frequent practice is the creation of **hidden reserves.** Those most commonly arising result from:[6]

1. Reducing the total value of the assets by
   (a) Charging additions or betterments to expense.
   (b) Charging assets of real value off the books against Profit and Loss or Surplus.
   (c) Writing down the book value of assets of real value beyond what is proper, either through the taking of excessive depreciation or by arbitrary write-offs.
2. Increasing the showing of liabilities improperly by
   (a) Entering fictitious liabilities.
   (b) Overstating actual liabilities.

Examples of 1 above are:

1. Charging additions to repairs.
2. Creating excessive allowances for bad debts.
3. Charging manufacturing cost to expense, thus reducing inventory values of goods in process and finished goods.

When hidden reserves are created intentionally, they usually result from the following motives:

1. To be conservative or to avoid any possibility of being accused of misrepresentation.
2. To lessen taxes by understatement of net worth or profit.
3. To keep stockholders in ignorance of true conditions, either:
   (a) Fraudulently, to induce some of them to sell their stock for less than it is really worth; or
   (b) With honest intent, that there may be a hidden surplus from which dividends at the same rates may be declared in years of lean profits.
4. To keep competitors in ignorance as to real worth of the business.

Overstating Surplus.—This may be done by overstating assets or understating debts, but is never justifiable. It may result from fraud, ignorance, or overoptimism. Failure to provide sufficiently large depreciation reserves leads to the same result, but high income taxes have checked this tendency. This applies both to fixed assets and to inventories. Balance sheets should not have to be discounted arbitrarily.

VALUATION.—Certain rules are laid down for valuing assets. For full discussion see section on "Valuation." Liabilities present a problem of inclusion, not of valuation. All liabilities must be shown in the balance sheet whether due or not.

---

6 The Surplus of Corporation, by P. W. Pinkerton, in *Administration*, Feb. 1923.

Assets Valuation.—Various bases of valuation[7] of assets are:

1. Original cost.
2. Cost of reproduction.
3. Original cost less depreciation to date.
4. Market value.
5. Forced sale value.

Since these bases give widely different results, the amount of surplus depends on the base adopted, as well as on the care with which it is applied. So long as a business is prosperous, its assets should be valued on a going concern basis. In case it goes into the receiver's hands, the valuation should be conservative but still on a going concern basis. This basis should be **cost-less-depreciation** to date. If the receivership fails to rehabilitate the enterprise and the assets are sold at auction, the basis becomes forced sale value. The basis of valuation changes when the use to which a thing is put changes. Moreover, assets must be valued with reference to their own characteristics, so that the basis of valuation applicable to current assets is not the same as that applicable to fixed assets. Changes in market value of current assets are a much more important factor in valuation than they are in valuation of fixed assets.

Cost is sometimes difficult to determine. **Complicating factors** in case of large plant assets are: freight on machinery, installation costs, salaries and interest during construction, developmental costs, etc.; also later repairs, additions, betterments, etc.; also the handling of depreciation.

Cost at best is an approximation. There is a tendency to make certain **departures from the cost rule** in case of going concerns, owing to permanent increases in value occurring in many instances, which, if not adjusted on books, result in **hidden reserves.** Consequently in place of cost has been substituted **cost to reproduce.** This rule should be followed only when the increase in value is considerable, unquestionable, and permanent. As a rule such variations from cost should be made for balance sheet purposes only, original cost being reflected by the books.

Inventories are valued at "cost or market, whichever is lower," but frequently departures from this rule are permissible. Montgomery suggests the following bases to fit varying circumstances:[8]

1. Less than either cost or market.
2. Cost or market, whichever is lower.
3. Reproduction cost when that is higher than replacement cost.
4. Market when market is higher than cost.
5. Selling price.

Writing inventories down to a figure below cost is equivalent to the establishment of a Reserve for Inventory Fluctuations.

Appraisals of fixed assets become relatively more important as cost as a basis of valuation is abandoned in favor of cost to reproduce. When employed, the adjustment should not be made through Profit and Loss but direct to Capital Surplus.

When assets are written up, **depreciation** written off should be separated into two parts, the part applicable to original cost being a charge to income, and the part applicable to appreciation in value being a charge against the surplus set up at time of assets' revaluation.

---

[7] For detailed discussion of the basis of valuation for rate purposes, see Saliers' Depreciation, Principles and Application, pp. 364–406.

[8] Auditing, Theory and Practice, Vol. I, p. 126.

SURPLUS AND NO-PAR STOCK.—At time of sale, no-par stock should be credited for sale price. Some accountants carry surplus arising from operations to the No-Par Stock account, but it is better to carry it to a separate surplus account. If no-par stock is repurchased at a price other than its original sale price, surplus is affected. If bought in excess of original sale price paid-in, surplus is reduced by such excess; if below original sale price, paid-in surplus is increased. If it was issued at different times and at varying prices, one of two procedures is possible. One is to take the average value of all stocks issued. The other is to compare price of reacquired stock with original selling price of the identical shares. Neither procedure has yet become the standard.

SURPLUS ADJUSTMENTS.—When errors made in former accounting periods are discovered, they should be adjusted through Surplus. If numerous, open a **Surplus Adjustment account.** After all corrections are made, carry balance of this account to Surplus. In stating current year's results, begin Surplus with balance of previous year, then bring in balance of Surplus Adjustment account as a debit or credit and bring down the balance as the **true balance from previous year;** then bring in results of current year. If corrections affecting profit and loss extend over two or more years, discriminate between errors affecting surplus permanently and those affecting profit in a given year but which are offset in the next year and so do not affect final amount of surplus.

If it is found that any **bad debts** were not taken into consideration, credit Accounts Receivable and charge Surplus, thus permanently reducing it, unless there is an adequate bad debts reserve, in which case it should be charged.

If **betterments** and **extensions** have been wrongly charged to Repairs, adjust by charging Plant account and crediting Surplus.

If, as the result of an error, the **inventory** is too large, charge Surplus and credit Inventory for the amount of the error. Since in the succeeding period the old inventory becomes a credit, an error in the inventory results in no permanent error in surplus. Consequently, if surplus is to be adjusted each year, the correcting entry made to adjust surplus must be reversed the next year. If only final amount of surplus is desired, no adjustment is required.

If adjustments are few in number and of small amount, they may be carried to current Profit and Loss to avoid the trouble of adjusting surplus.

APPROPRIATED SURPLUS.—Surplus is subject to control by the board of directors, except where their authority in this respect is limited by law, as in case of certain classes of financial corporations. Frequently powers of directors in this respect are limited by contracts, as where the deed of trust of a bond issue provides for establishment of sinking funds out of earnings. Otherwise the powers of the board of directors are practically unlimited, so that it is usually within their power to reverse any action previously taken to impound or reserve a portion of surplus. This possibility of a reversal of action previously taken is often overlooked by business men.

UNDIVIDED PROFITS.—Sometimes the subdivision of surplus into two parts, a Surplus account proper and an Undivided Profits account, is done to convey the idea that the "surplus" division is to be retained in the business, while the "undivided profits" division may be used for dividend payments. Care should be used in impounding surplus and thus preventing payment of dividends, because a discontinuance of dividend payments may impair the credit of the company or cause other evil results.

DISTRIBUTION OF SURPLUS.—In general, directors may declare dividends so long as they do not impair capital, i.e., reduce net worth to less than

par shares outstanding. In case of no-par shares, the question has not been finally settled by the courts. In some states impairment would probably result if net worth were reduced below amount for which stock was originally issued. In other states impairment would probably result only when net worth is reduced below a stated amount prescribed by law. This is $5 per share in New York.

Limitations upon dividend payments are not always definite. Seymour Walton says[9]:

> It is difficult to state concisely a rule for determining the legality of a dividend, partly because of the various sources of surplus, and partly because of the diversity of judicial decisions governing the matter. It is sometimes stated that dividends can be paid only from profits, but this is not an exact statement because the law allows a corporation to distribute in the form of dividends any premium which may have been paid to the company on its stock. It is true that the directors should not deceive the stockholders by allowing them to believe that the dividend was provided by profits, but this is a question of ethics and not of law.
>
> Nor is the statement correct that dividends can be paid only from surplus, which means that after the dividend has been paid there must be actual net assets equal to the capital stock. For instance, if the development or organization expense is still carried on the books as an asset, it is not imperative that it shall be written off before a dividend is paid, provided a reasonable portion of it is canceled and the course of the business justifies the carrying of the remainder as a deferred charge.

Surplus resulting from setting up on books of **appreciated values** should not be distributed as dividends. It should be earmarked to render it easily distinguishable.

The rule that dividends must not be declared unless net worth, exclusive of appreciation, will after the declaration equal or exceed capital stock, may be regarded as the one generally applicable in this country to corporations which have sustained losses by which capital has already been impaired. Capital impairment should be wiped out by earnings, assessments, or voluntary contributions, and net worth be brought back to more than par of capital stock, before dividends are proper. In England dividends may be paid in any period when profits are earned regardless of capital impairment.

In case of corporations exploiting natural resources, it is not necessary to retain all money invested by stockholders until all activities are completed. In the English case of *Lee* v. *Neuchatel Asphalt Co.*,[10] it was held that "if the company retains assets sufficient to pay its debts . . . . there is nothing whatever in the Act to prevent any excess of money obtained by working the property over the cost of working it from being divided amongst the stockholders." In general, American decisions are in accord with this, although some are not so broad.

Criminal liability attaches in some states to payment of dividends out of capital. Where criminal liability does not attach, the directors may make such distribution if willing to assume personal financial responsibility for return of the money in case the company goes into insolvency. Explanation should accompany such declaration to the effect that the dividend is not paid out of profits. Such dividends should be charged to **Advance Payments on Dividends Not Earned or Declared,** or similar account. This remains on the books as an asset until surplus sufficient to declare a legal dividend is accumulated, when these advances should be deducted from the dividend so declared.

---

[9] Advanced Accounting, p. A 271.
[10] L. R. 41 Ch. D. 1 (1889).

Dividends may be classified as follows:

1. Dividends which reduce the net worth of the corporation:
   - Type 1. By reducing assets.
   - Type 2. By increasing liabilities.
2. Dividends which do not reduce net worth of the corporation:
   - Type 3. Stock dividends.

Any dividend not paid in the company's own stock reduces net worth, whether cash or scrip.

The Supreme Court of the United States, in *Towne* v. *Eisner*,[11] decided that stock dividends are not income and so are not taxable by the federal government.

DIVIDEND POLICIES.—Dividends may legally be paid whenever there is a surplus against which to charge them. Few corporations could exist following the policy of distributing the entire surplus in dividends, because few businesses can continue operations satisfactorily on a fixed amount of capital. Growth requires additional capital to carry accounts receivable, to handle increasing inventories, to enlarge plants. The most common way of securing additional capital is through earning profits and retention of these in the business.

Even if expansion is not desired, few businesses can distribute all surplus safely, because there are few whose profits are represented by cash as fast as earned. Most enterprises have to give credit, and much profit is necessarily tied up in accounts receivable. In determining whether a dividend should be paid, the cash situation as well as the mere existence of a surplus should be

Analysis of Surplus

Balance of Surplus, Dec. 31, 1922			$100,000
Adjustments Applicable to Prior Periods:

NET WORTH				$4,384,150.11
TOTAL LIABILITIES AND NET WORTH				$5,425,345.71

Detailed Analysis of Surplus.

considered. While it is legal to pay dividends with borrowed money, provided there is a surplus, the courts are inclined to question the motives behind what is usually a display of poor business judgment. The writer knows of trials where the judge considered such payments from borrowed money a prima facie evidence of fraud.

It is ordinarily considered bad policy to pay dividends out of surplus unless profits have been earned in the preceding year. The exceptions to this rule are found in the cases of those corporations whose dividend policy has been conservative to such an extent that they have accumulated a surplus in excess of their needs to enable themselves to continue an uninterrupted dividend record through lean years.

SURPLUS ON THE BALANCE SHEET.—Handling of surplus in the balance sheet is based on the principle that surplus and capital stock together comprise net worth. It is usual to group them so as to show total net worth. If, instead of a surplus, there exists a deficit, this should be shown as a deduction from capital stock rather than among the assets.

A first requisite is to show surplus available for dividends as distinguished from that not so available.

Surplus arising from appreciation of asset values should be carefully separated from that arising from other sources, to eliminate the danger of its being used for dividend payments. To this should be added amounts reserved from dividends by action of the board of directors or by contracts requiring the establishment of reserves.

Another desirable classification is between earned and capital surplus. Accounting practice favors the theory that earned surplus be distributed as dividends before capital surplus is distributed.

However, for purposes of income tax, Congress has enacted that dividends "shall be deemed to have been made from the most recently accumulated undivided profits or surplus."[12] In *Harder* v. *Irwin*,[13] the United States District Court, Northern District of New York, holds this rule to apply "regardless of the language of the resolution or the intent of the company." This is subject to change, so does not necessarily determine accounting practice.

Non-operating reserves, that is, proprietorship or surplus reserves, being part of corporate surplus, should be so shown on the balance sheet that their total will be accumulated in total corporate net worth.

Operating reserves, being either deductions from asset values, or else representing true liabilities, should not be shown as part of net worth. Those termed **valuation reserves,** because they place a measure on specific asset values, are preferably shown as deductions from asset values.

Declared and unpaid dividends are an actual liability. Cumulative unpaid dividends should not be accrued on the balance sheet. They become a liability only when declared. For the information of those concerned they may be mentioned in a footnote to the balance sheet.

When declared, the amount of dividends should be removed from surplus to a liability account, Dividends Payable.

Analysis of surplus in the balance sheet may be somewhat as shown in Form 3, when it is desired to show changes in surplus during the last fiscal period. A form of balance sheet setting forth a detailed analysis of surplus is shown in Form 4.[14]

SECTION 6

FINANCIAL STATEMENTS

CONTENTS

(For list of forms, see complete table of contents.)

SECTION 6

FINANCIAL STATEMENTS

Fundamentals

FUNCTION OF FINANCIAL STATEMENTS.—Enterprises issue financial statements for certain purposes, chief among which are:

1. To meet the requirements of management.
2. To meet the requirements of investors.
3. To meet the requirements of governmental regulations.

REQUIREMENTS OF MANAGEMENT.—Management involves internal and external problems. Internal problems are those involving financial structure, handling of cash and current assets, and supervision of operating processes. External problems cover a concern's relationship with individuals and corporations. Usually **credit** is involved in external relationships, and the **credit structure** of a concern is continually under observation of those who enter into credit relationships with the company. These various processes of finance and operation require constant supervision. This supervision must be based on accurate information derived from experience and so standardized as to enable possible comparisons to be made between processes and procedures within a given concern and over a certain number of years, also between concerns sufficiently alike to make comparisons of results valid. This standardized information must be compiled in form of **reports** and **statements.** Of these statements, the most important are the **balance sheet** and **income statement.**

BUSINESS STATISTICS.—The **balance sheet** and **income statement** are forms of business statistics valuable chiefly for the relationships which they disclose. The abstract facts contained in these statements are in themselves of little value; they should be used to make comparisons and show relationships.

The **balance sheet** indicates the sources of capital used in a business and the manner in which it is invested. The **sources of capital** are shown on the right-hand side of the balance sheet, the liability side. The **investment of capital** is shown on the left-hand side of the balance sheet, the asset side. Capital is invested in assets in proportions which vary with the nature of the business. In some businesses proportion of total capital required in form of fixed assets is large; in others it is relatively small. Significant relationships exist between sources of capital and the invested form which it takes. Capital, in case of corporations, is secured chiefly from three sources: (1) stockholders, including both original contributions and accumulated earnings; (2) issuance of long-term obligations; (3) issuance of short-term obligations. The amount of capital received from each of these sources must bear a more or less definite relationship to the manner of its investment in the various asset forms. Capital invested in fixed assets should be derived from sale of long-term securities, stock or bonds. Returns

secured from sale of short-term securities should not be invested in fixed assets but be reserved for purchase of working assets, and a sufficient excess of working assets over current liabilities should be maintained to preserve a suitable **working capital ratio**; that is, sufficient working capital should be secured from sale of stock or long-term securities so that total working capital will exceed current liabilities by a sufficiently wide margin.

The **income statement** gives the history of operating results over a period based on data covering gross income, cost of service performed or commodities sold, and resultant effect on proprietorship. Total revenues must be first used to make good cost of service performed, including all expenses of both direct and indirect character. Any balance thereafter remaining represents increase in proprietorship to be carried to surplus. In a particular branch of industry all items reflected in the income statement bear more or less definite relationships to each other, so that **ratios** representing these relationships become bases for determination of policies and procedures. If sales are taken as 100%, then all costs and expenses must be in proper proportion thereto to realize a profit. The **form** of the income statement should be devised to facilitate comparison of important items. This necessitates logical order and proper classification. The important relationships found in the income statement, according to J. H. Bliss, are:

1. Costs to sales.
2. Gross profits to sales.
3. Expenses (in detail) to sales.
4. Operating results to sales.
5. Non-operating income and expenses to sales.
6. Surplus net profits to sales.

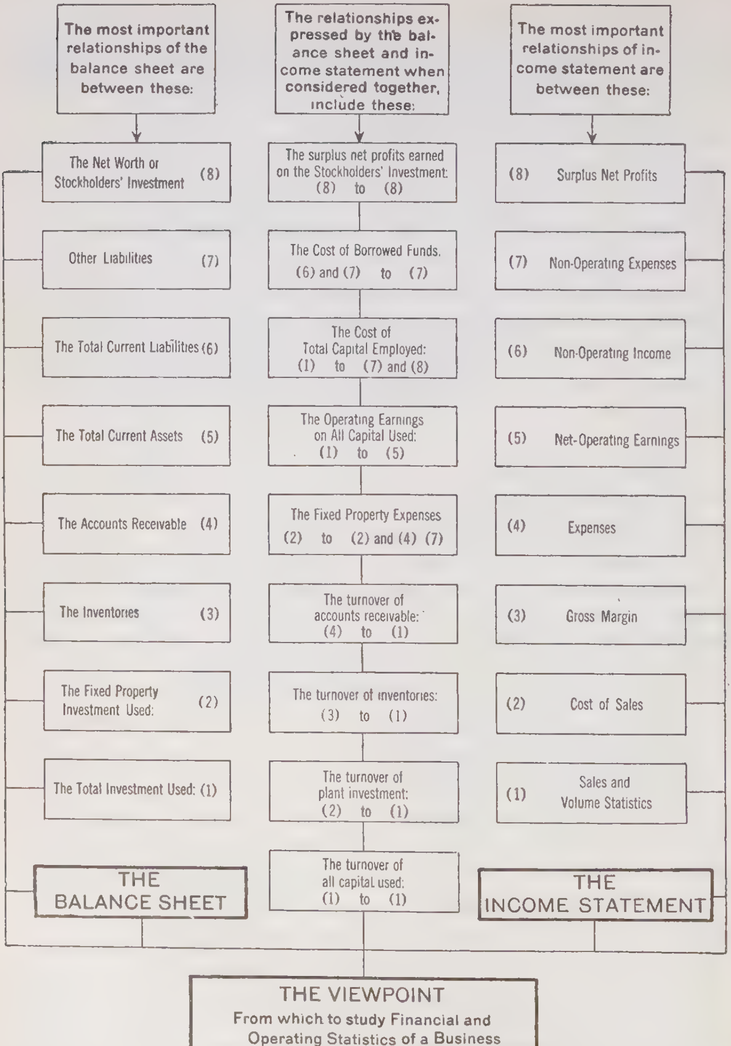
The balance sheet and income statement should also be **considered together** to obtain certain comparisons. Bliss lists the following **relationships** and **measurements** thus secured:

1. Ratio of surplus net profits to stockholders' investment.
2. Ratio of operating profits to total capital employed.
3. Turnover on total capital.
4. Turnover on plant investment.
5. Turnover of inventories.
6. Turnover of accounts receivable.
7. Cost of borrowed capital.
8. Cost of all capital employed.

Supporting statistics are necessary in connection with balance sheets and income statements, to permit the desired amount of detail in comparisons. These statements should be subjected to **statistical analysis**, the purpose of which is to reflect tendencies and conditions whose resultant combined effects are shown in the general financial statements. After statistical analysis has been applied, the detailed results secured should be considered in relation to the balance sheet or income statement to which they apply.

SIGNIFICANT RELATIONSHIPS IN FINANCIAL STATEMENTS.—Before attempting to analyze balance sheets and income statements, it is necessary to determine what **relationships represented in or between** these statements have significance. The accompanying chart, prepared by J. H. Bliss (Form 1), shows these relationships.

Balance sheets and income statements which conceal these important relationships are not properly constructed. They show lack of appreciation of these



Form 1. Chart showing Relationship between Significant Items in Financial Statements
(By J. H. Bliss)

relationships on the part of those who construct them. Before the form of these statements is determined upon in any business, attention should be given to the relationships that should be expressed in them. They should then be given such form and classification as make the desired comparisons easy. The accompanying chart compiled by Bliss (Form 2) indicates the comparisons to be made in financial statements. A condensed balance sheet is shown on the right; a condensed income statement on the left. Each item is numbered to facilitate reference. At the bottom of the chart, important measures and relationships are worked out, the items used to secure the results being indicated by numbers given in the statements.

Following are comments on more important relationships in financial statements.

1. **Relation of surplus net profits to net worth** is the measure of earning power from stockholders' point of view. In competitive businesses of a given type this tends to a fair average, bu varies as between types because of nature of risk involved. Other things being equal, the return is an index of financial and operating efficiency. The following table compiled by Bliss shows average percentage return on net worth of concerns engaged in various lines:

	Number of Years	Average per Year %
Showing large return on net worth:		
Explosive manufacturers	6	19.5
Glass manufacturers	6	17.1
Petroleum oil companies	7	16.4
Shipbuilding	7	13.8
Anthracite coal	8	13.1
Boot and shoe manufacturers	7	12.2
Showing small return on net worth:		
Vegetable oil manufacturers	7	2.2
Leather manufacturers	9	3.6
Fertilizer manufacturers	9	4.0
Paper manufacturers	9	5.0
Woolen and worsted goods	8	5.6
Slaughtering and meat-packing	9	6.2

2. **Percentage of operating profits to total capital used in operation** is the test of results viewed from the operating point of view. No regard is paid to source of capital. Operating profits are profits shown after meeting costs and expenses but before paying interest or other return on capital employed. The relation of surplus net profits to net worth is not a test of operating results, because it is affected by amount of capital secured from outside sources, bonds, notes, etc. Methods of financing concerns engaged in similar operations may differ widely. Consequently total capital employed must be considered. Yield on stockholders' investments is greater or less when part of capital is borrowed than when none is borrowed, accordingly as capital can be made to earn more or less than interest rate on borrowed funds. If balance sheet and income statement are properly organized, capital used in operations and net profits on operations will be clearly set forth.

3. **Relation of surplus net profits to sales** (volume of business) measures profit on basis of turnover. It is complementary to (1) above, which shows relation of surplus net profit to net worth. The rapidity of turnover necessary to produce a fair rate of return on investment depends upon margin of profit.

THE CONDENSED BALANCE SHEET

No.	ASSETS	Amount	%
1	CURRENT ASSETS:		
2	Cash	$ 50,000	5.0
3	Accounts and Notes Receivable	125,000	12.5
4	Inventories	200,000	20.0

38	COMMON DIVIDENDS	40,000		
39	SURPLUS ADJUSTMENTS	......		
40	NET CHANGE IN SURPLUS	$ 13,000		

Balance Sheet Relationships:

- A–Net Working Capital (6 − 16) $225,000.00
- B–Net Working Capital Ratio (6 ÷ 16) .... $ 2.28
- C–How Capital is invested—
  Proportion of each of items 1-10 to number 11. That is the proportion of total capital in each class of assets.
- D–Sources from which capital is secured—
  Proportion of each of items 13-24 to number 25. That is the proportion of capital secured from each of the various sources.
- E–Book Value of Common Stock $ 125.00
  The sum of numbers 21, 22, and 23 divided by number of shares outstanding. Assumed Preferred Stock has no interest in Surplus and Common Stock of $100.00 par value.

Measures of Earnings and Turnover:*

- F–% Earned on Net Worth (35 ÷ 24) 10%
- G–% Earned on Common Stock (37 ÷ 21) 13.2%
- H–Book Value of Common Stock (21, 22, 23) per share $125.00
- I–Cost of Borrowed Money [33 ÷ (14 + 17)] 8½%
- J–% Operating Profits on Total Capital (32 ÷ 11) 9.0%
- K–Turnover of All Capital (27 ÷ 11) $1.00
- L–Turnover on Fixed Property (27 ÷ 8) $2.50
- M–Turnover of Inventories (27 ÷ 4) $5.00
- N–Turnover of Accounts Receivable (27 ÷ 3) $8.00
- O–Lbs. Shipped per $1.00 of Plant Investment (26 ÷ 8) .... 25 lbs.
- P–Fixed Property Expenses % on Plant Investment (Expenses in 28 and 30 ÷ 8).

Income Statement Relationships:**

- Q–Average Prices (27 ÷ 26), $10.00 Per Cwt.
- R–Gross Earnings, 70% on Sales and $7.00 Per Cwt.
- S–Expenses, 21% on Sales and $2.10 Per Cwt.
- T–Operating Profits, 9% on Sales and $0.90 Per Cwt
- U–Interest Costs, 2.5% on Sales and $0.25 Per Cwt.
- V–Surplus Net Profits, 6% on Sales and $0.60 Per Cwt.

---

*The turnovers are stated above as dollars of sales per one dollar of capital used. They may also be stated as the number of times per year.

**The Cost of Goods Sold item should be supported by appropriate cost statement with unit costs and ratios developed.

Form 2. Chart Summarizing Important Relationships to be Noted in Financial Statements
(From J. H. Bliss, "Financial and Operating Ratios in Management")

Thus where margin of profit is wider in one instance than another, to yield the same return, turnover need not be as rapid. Range of surplus net profits earned on sales is shown in the following table compiled by Bliss:

	Average % Earned on Sales
Industries with wide margin on sales:	
Lead production, average for 7 years	25.0
Petroleum oil production, average for 7 years	19.0
Bituminous coal, average for 7 years	18.6
Anthracite coal, average for 8 years	16.5
Sugar production, and refining average for 8 years	15.7
Industries with narrow margin on sales:	
Slaughtering and meat-packing, average for 9 years	1.3
Leather manufacturing, average for 9 years	4.0
Mail-order merchandising, average for 9 years	4.8
Rubber and tire manufacturing, average for 9 years	6.7

4. **Relation of operating profit to sales** is complementary to relation 2 above. This ratio shows profits earned on turnover, and relation 2 shows return earned on capital. Where a turnover of one per annum is secured, these ratios are equal. As a test of operating results this is superior to relation 3, because interest costs are not considered.

5. **Relation of gross earnings to sales** is a ratio highly characteristic of a given type of business, and consequently varying widely as between different lines. Gross earnings is found by deducting cost of goods sold from net sales. If a business is departmentized, each department will be found to have its own characteristic ratio.

6. **Relation of expenses to sales** is the best index to operating efficiency. These relations are expressed as so much per unit where quantity statistics are available, and as percentages when based on sales expressed in dollars. This ratio should be applied to the various subdivisions of expense for departments as well as for the entire business. Where quantity statistics are available, the expenses figured as dollars or cents per unit of commodity sold are effective measures of results secured. These should be supplemented by the percentage ratios.

7. **Relation of fixed property expenses to fixed property investment** is an index of economy and efficiency in the upkeep and management of fixed assets. The complementary ratio is that of fixed property expenses to sales. **Fixed property expenses** include all costs arising from ownership and use of fixed assets—taxes, upkeep, depreciation, etc. These are in the nature of fixed charges and do not vary extensively with variations in volume of business. There is danger of burdening a concern with a heavy fixed burden as the result of unwarranted extensions of plant or permanent equipment. The annual fixed charge imposed by such additions amounts to approximately 20% of their first cost, 9% representing cost of money, 5% depreciation, and 6% repairs, insurance, taxes, etc.

8. **Cost of borrowed capital** may be considerably different from the nominal rate paid on outstanding bonds. If these were issued at a premium or discount, true interest cost should be determined by means of a correct amortization schedule. Also expenses incidental to sale and retirement of bonds should be taken into consideration.

9. **Cost of total capital employed** should be carefully determined so that the

productivity with which it is managed can also be determined. Bliss gives the following plan of determining this cost:

(a) Determine full cost and expenses of borrowed money, making due allowance for amortization of premiums, etc.
(b) Determine fair competitive return on stockholders' total equity in the business which should be earned by operations.
(c) These together afford a measure of real cost of capital.

This cost will ordinarily amount to 9% or 10% per year on total capital employed.

10. **Turnover of inventories.** See section on "Inventories."

11. **Turnover of accounts receivable.** See Index.

12. **Turnover on fixed property investment** is ratio of sales to capital invested in plant and equipment. When fixed property investment enjoys a rapid turnover, overhead is reduced and the competitive position of the concern improved. The remedy for a slow turnover is either adjustment of property values or increase in sales. Reduction of investment of property is usually difficult to accomplish. It is better to keep careful watch of investments in plant in order to avoid all unnecessary expenditures of that type.

13. **Turnover of total assets** is ratio of sales to total capital employed. This is a valuable test of operations. It differs widely in different lines. As among similar enterprises, slow turnover of total assets is a competitive handicap.

14. **The working capital ratio** is the ratio of current assets to current liabilities. It is used to express a concern's status from a credit point of view, and the maintenance of a favorable ratio between current assets and current liabilities is necessary to a good credit position in the eyes of bankers and investors.

Analysis and Interpretation of Balance Sheets

FORMS OF BALANCE SHEETS.—Balance sheets are found in innumerable forms and arrangements. There is no satisfactory reason why English accountants place assets on the right side and liabilities on the left side, whereas American accountants use the reverse arrangement.

In the United States the **account form** of balance sheet has assets on the left and liabilities on the right. The **statement form** has assets above and liabilities below. R. H. Montgomery gives the following requisites of an ideal balance sheet:[1]

1. The assets, properly valued and grouped, and arranged in order of availability. This form is sanctioned by bankers and credit men.
2. The liabilities also properly grouped and arranged in the order in which they will, or should, be discharged.
3. If possible, excess of assets or liabilities should next be shown, so that net worth or capital may be apparent.
4. A statement showing to whom the excess belongs or from whom it is due.

These concepts are illustrated in Form 3.[2]

Among large **industrial corporations** the balance sheet shown in Form 4 is most popular.[3] Owing to the fact that this form presupposes the ability on the reader's part to discriminate between actual liabilities and surplus, Montgomery prefers the balance sheet shown in Form 5.[4]

Form of Balance Sheet.

In balance sheets in which fixed assets come first, it is customary to place capital stock first among the liabilities, and surplus last. Consequently, the relation of fixed assets to stockholders' capital is more easily noted in the above form which places capital stock and surplus together. This is an important feature because surplus is sometimes a very large part of total invested capital. Any form of balance sheet is suggestive in the sense that it may require modification to meet requirements of individual enterprises. In any event, the **relationship between groups** requires emphasis more than does their mere **arrangement.** Fixed assets should be placed first or last according as important relationships are brought out by the arrangement adopted.

BALANCE SHEET PROPOSED BY FEDERAL RESERVE BOARD.—The Federal Reserve Board, in a pamphlet on "Uniform Accounting," proposes the form of balance sheet shown in Form 6.

For the balance sheet of the United States Steel Corporation, see Section 31, Form 36.

LACK OF UNIFORMITY IN BALANCE SHEETS.—Lack of uniformity extends to both **form** and **substance**; that is, not only are items arranged differently, but the items themselves differ. Sometimes the same title is used in a more comprehensive sense in one balance sheet than in another without the difference in use appearing on the face of either balance sheet. The nature of the business requires some differentiation in accounts which is necessarily reflected in the balance sheet. The balance sheet of a department store must differ in certain respects from that of a mining company, and the balance sheet of a mining company must differ from that of a manufacturing concern. The size of the business is a factor to be considered. Balance sheets of incorporated enterprises differ from those of unincorporated enterprises in method of showing proprietorship. The balance sheet of a holding company differs from that of an operating company.

DATE OF BALANCE SHEET.—This is an important factor in balance sheet interpretation. A balance sheet dated Dec. 31 may not be representative of conditions as they existed 3 months earlier, or as they will exist 3 months later. There is a growing tendency to make calendar and fiscal years coincide. Sometimes an attempt is made to date the balance sheet when conditions are most favorable.

BALANCE SHEET AND BUSINESS CYCLE.—The point in the business cycle at which a balance sheet is dated is a factor to be considered in its interpretation. Changing business conditions are constantly altering the status of many asset and liability accounts, especially current assets and liabilities. These factors may change the status of an enterprise from a condition of solvency to one of insolvency in a comparatively brief period.

VARYING DEPENDABILITY OF FIGURES.—Especially in industrial concerns, there is likely to be a variation in the **substance** of the accounts, i.e., in the reliability of the figures. There are several reasons for this, as follows:

1. The final figures may be secured in various ways. If a professional accountant audits the books, he may require changes which would not be made were no independent audit required. Accountants themselves differ in their opinions regarding treatment of many items.

2. The form and content of the balance sheet are sometimes varied to answer certain purposes, as to reduce tax liability or to make a more favorable showing for credit purposes.

3. The age of the balance sheet is a factor. If considerable time has

intervened since the date of the last balance sheet, it should be discounted accordingly.

4. There is a large element of judgment in every balance sheet; consequently balance sheets are not infallible even when drawn up with best intentions.

5. The tendency of business men to be optimistic concerning their own businesses is likely to be reflected in balance sheets. They overvalue assets and underestimate or neglect contingent liabilities.

ANALYSIS OF ASSETS.—The analysis of assets is a problem in functional segregation and the application of principles of valuation. The principles of valuation are discussed in detail in section on "Valuation," and are considered here only as they are necessary to the process of interpretation of financial statements.

Assets will be considered under the following titles:

Fixed Assets:
1. Real Estate
2. Leaseholds
3. Mineral and Timber Lands
4. Equipment and Machinery
5. Furniture and Fixtures
6. Pattern, Drawings, etc.

Intangible Assets:

7. Good-Will
8. Patents
9. Trade-Marks
10. Copyrights

Current Assets:

11. Cash
12. Investments
    (a) Temporary
    (b) Permanent
13. Notes Receivable
14. Accounts Receivable
15. Inventories

Deferred Assets:

16. Organization Expenses
17. Discount on Stocks and Bonds
18. Other Items

1. **REAL ESTATE.**—This item includes land and improvements thereon; also buildings and leaseholds. Legally land and buildings are one, but the accountant must consider them separately because of the depreciation factor. A careful distinction should be made between land used in the business and land held as an investment or for purposes of future growth. The investment in the former should be included in figuring turnover of invested capital, but the latter should be omitted because it is not employed to aid operations.

Cost of land properly includes expenses incidental to its acquisition and preparation for use—title search, registration fees, cost of recording and conveyancing, taxes accrued to date of transfer of title, etc. It is best to keep **improvement costs** separate from original cost of land. Among improvement costs are those incurred for drainage facilities, filling in, cutting down embankments, etc. The same general principles apply in case of **land bought for investment,** but it is ordinarily desirable in this case to add carrying charges to the investment. Set up a reserve out of profits equal to these capitalized carrying costs to cover possible loss of this portion of the investment in case of sale of the land.

Land held by realtors for development and sale is **stock-in-trade.** All development costs and carrying charges should be capitalized. In real estate developments, costs are kept by **plots.** Each plot is subdivided into **lots,** the cost of each being found by dividing the cost of the plot by the number of lots in it. This procedure is necessary to determine profit or loss on each lot sold. To determine true profit on such developments, it is necessary to capitalize all running expenses, such as interest and taxes, on each lot. To guard against failure of realizing such carrying costs, a reserve should be created. Whenever

a lot is sold, the part of the reserve applicable to it should be adjusted, such portion thereof as is realized in the sale price being carried to surplus.

Valuation of buildings is determined in the first instance by their purchase price or cost of construction. If constructed under contract, the contract price is the determining factor. If a concern does its own construction work, it should charge a fair proportion of the time of its administrative staff to construction; also cost of drawings and architect's fees, as well as all labor and material costs. Interest on borrowed money during construction period should also be capitalized, also insurance costs of all kinds applicable to the construction period.

2. VALUE OF LEASEHOLDS.—This depends directly upon the life of the lease. Ordinarily, improvements on leased land become the property of lessor on expiration of the lease; therefore all costs should be amortized during life of the lease. In **valuing leaseholds** it is necessary to deduct annual costs from annual income. The remainder is an **annuity** for the number of years the lease runs. Its present worth can be found by finding present worth of an annuity of $1 for the given number of years, and multiplying same by the amount of the annuity. If any sum is recoverable from lessor at expiration of lease, as is sometimes agreed upon in case of extraordinary improvements made by tenant, its present worth can be found by use of compound interest tables. This, added to present worth of the annuity, gives present worth of leasehold.

3. MINERAL AND TIMBER LANDS.—These items are oftentimes given valuations in balance sheets which are mere approximations, because of the difficulty of determining what part of proceeds from sales is a return of capital and what is profit. Among **mining companies** it is customary to pay in dividends all amounts realized after current expenses have been met. In case of bond issues, however, it is customary to make provision in the **deed of trust** for their redemption by requiring the creation of a sinking fund out of a part of the returns realized on sales. The chief objection to setting up a reserve to cover mineral depletion is that it requires the tying up of large sums in rather unproductive investments. As a consequence, capital is being constantly paid out in form of dividends, and, unless frequent adjustments are made in the investment accounts, discrepancies arise between book values and actual values. Where sinking funds are created, in case of wasting assets, it is accomplished by setting aside a percentage of sales, not on the actuarial basis.

In case of **timber lands,** value of the assets depends upon whether or not systematic **reforestation** is practiced and whether proper reservations are made for fire hazard. Increases in value from year to year due to natural growth are a factor.

Depreciation and appreciation of land values should not usually be reflected by adjustments in the accounts until actually realized by some form of **conversion.** There is no objection, however, to setting up a **reserve** for depreciation of land values where there is danger that shifting of industrial activities may cause material declines in land values.

4. EQUIPMENT AND MACHINERY.—Under **equipment** are included expenditures for heating plant, ventilating system, engines, boilers, dynamos, and water connections, including cost of installation. Equipment is classifiable on various bases. Ordinarily the classification should be into classes of approximately **equal lives** to facilitate calculation of depreciation. Other possible bases are **kind** and **manufacturing units.** In a classification on basis of kind, there would be included within a given group all parts of equipment pertaining

to a given function. In a classification on basis of manufacturing units, all property would be classified in the ledger on basis of operating units or departments. In any event, greater accuracy is secured in the general accounts and consequently in the balance sheet when detailed subsidiary records are kept.

For **machinery and fixed tools** a subsidiary record should be kept for details to insure the accuracy of the total found in the general ledger. Small tools having a comparatively short life should ordinarily be charged direct to operating expense.

5. **FURNITURE AND FIXTURES.**—This includes movable partitions, lighting fixtures, all kinds of furniture, calculating machines, etc. **One plan** of handling this item in the accounts is to capitalize the cost of a complete outfit, then charge all repairs and replacements to Profit and Loss. **Another plan** is to capitalize new acquisitions and systematically write off depreciation. This item should be written down rapidly.

6. **PATTERNS, DRAWINGS, ETC.**—In judging these items in a balance sheet, the most important consideration is the adequacy of the depreciation reserves. These depreciate very rapidly, especially where made to meet a special demand.

7. **GOOD-WILL.**—This item is one of the most difficult items to evaluate accurately. It is, consequently, the one most likely to be inflated. For a consideration of all factors entering into the determination of good-will valuation, see section on "Good-Will." Good-Will may be permanent or ephemeral, depending on its origin and character. It may or may not be transferable. Where it is dependent on the policy pursued by the management, it may be expected to persist so long as the policy which gave rise to it is pursued. Where it is dependent on patents, it does not necessarily follow that its value will terminate with the expiration of the patent, for the reason that the concern owning the patent is given an opportunity to establish a monopoly of the market.

Earning power should always be considered in relation to good-will; naturally, if this does not provide more than a fair return on tangible invested capital, there is little justification for inclusion of good-will among the assets. In considering earning power, eliminate any income resulting from unusual transactions which are in no way connected with the regular run of business. Sometimes large earnings appear as the result of inadequate depreciation charges.

Ordinarily good-will should appear on the balance sheet as the result of purchase, but there may be other circumstances which justify its inclusion, such, for example, as the admission of a partner.

Frequently good-will is brought upon the books at time of reorganization, and, although paid for by issue of securities, it represents merely the prospect of future profits. Stock is issued in excess of the value of physical assets, the difference being charged to Good-Will.

8. **PATENTS.**—In the United States the life of patents is 17 years, renewal being made only by special act of Congress. In interpreting a balance sheet, see that this item is set out separately and reduced in amount in proportion to the part of its life expired. Original value should be cost, whether purchase price or developmental expenditures.

9. **TRADE-MARKS.**—A trade-mark is a label or design protected by governmental grant. The life is 30 years, renewable for an equal period. Cost is nominal unless the trade-mark is purchased. Cost should be amortized over the legal life of the trade-mark.

10. COPYRIGHTS.—A copyright is the exclusive right to publish and sell literary productions. Its legal life is 28 years from date recorded. The renewal period is also 28 years. Usually the value of a copyright expires before its legal life ends. The cost is significant only when purchased from a former owner. In any case the cost should be amortized rapidly.

11. CASH.—This item consists of cash on hand and cash in bank subject to immediate withdrawal. I O U's should be excluded. Where cash is held in bank subject to withdrawal only upon several days' notice, it should be shown separately in the balance sheet. **Overdrafts** should be shown as current liabilities. Proceeds from sale of capital stock usually should be shown separately because they cannot as a rule be used to pay ordinary current liabilities, but are presumably being retained to make extensions or to refund long-term debts. Sometimes capital stock is sold to provide working capital, in which case this segregation is unnecessary.

12. INVESTMENTS.—Investments are **temporary** and **permanent.** Temporary investments are usually made to secure a return on cash held in excess of present requirements. Securities purchased for this purpose should be such as can be readily sold when additional requirements for cash arise. **Short-term notes** are of this type. Permanent investments are made either to control other companies or to establish sinking or other funds. Greendlinger classifies permanent investments thus:[5]

1. Investments in stocks and bonds of parent companies.
2. Investments in stocks and bonds of subsidiary companies.
3. Investments in stocks and bonds of allied companies.
4. Investments in stocks and bonds of outside companies.

Investments may be **pledged** or **unpledged.** All pledged investments should be so designated in the balance sheet.

A careful distinction should be made between investments in bonds and investments in stocks, because if bonds are bought at a discount or premium, true yield differs from nominal yield, and to secure the correct valuation it is necessary to amortize the premium or discount scientifically.

Attention should be given to the quality of securities invested in.

13. NOTES RECEIVABLE.—Notes and acceptances receivable from trade creditors arise out of business transactions. They should be separated from those arising out of accommodation extended to the company's officers or others. These latter are not usually regarded as highly as notes arising out of business transactions, because there is no certainty that they will be liquidated in due course of events. Notes assigned or pledged as collateral should be shown separately in the balance sheet. If notes receivable have more than one year to run, they should be regarded as investments, not as current assets. Assignment is not necessarily an indication of bad credit standing.

14. ACCOUNTS RECEIVABLE.—These may be classified as good, doubtful, and bad. **Good accounts** are those not yet due and which, it is anticipated, will be paid on time. **Doubtful accounts** are either those of debtors of questionable credit, or those which are overdue and concerning the ultimate payment of which there is doubt. **Bad accounts** are those which remain unpaid after ordinary means of collection have been resorted to. Terms of credit vary in different sections and businesses. General financial conditions are a factor.

[5] Financial and Business Statements, pp. 141–142.

In case of accounts receivable owing from debtors in bankruptcy, the account should be regarded as lost only after the bankrupt's discharge, because dividends may be received at any time previous to such discharge.

Accounts receivable other than those owing from trade debtors should be shown separately.

Suitable **reserves for bad and doubtful debts** should be set up based on a percentage of sales such as experience shows to be sufficient. This is a valuation reserve and preferably should be deducted from the accounts receivable account in the balance sheet.

15. INVENTORIES.—This includes merchandise in case of traders, and, in case of manufacturers, raw material, goods in process, and finished goods. Inventories of supplies are sometimes found; also various prepaid expenses are sometimes included in inventories. For methods of valuation, etc., see section on "Inventories." In case merchandise is pledged as **collateral for loans,** it should be set out separately in the balance sheet, or explanation made in a footnote or parenthetical reference.

In interpreting a balance sheet, the inventory should receive detailed consideration. Any marked increase in inventory values should be justified by sales prospects. In case of manufacturers, the value of the inventory should be considered with reference to length of time required in the manufacturing process and total annual sales.

16. ORGANIZATION EXPENSES.—These include promotion and legal expenses, incorporation fees, and other items incident to the starting of a new enterprise. These items should be written off over a period of years, which may vary from 3 to 5 and in some cases 10.

17. DISCOUNT ON STOCKS AND BONDS.—Capital stock cannot be issued at a discount in most states. If permissible, the discount should be charged to a special account and be treated as a deferred charge. Ordinarily this should be written off against Surplus before dividends are paid, because stock issued at a discount is equivalent to partly paid stock.

In case of bonds issued at a discount, the discount is an adjustment of interest and should be amortized over the life of the bonds. The account should be treated as a deferred asset, representing cost of financing. The discount should not be capitalized by being charged to the asset for the purchase of which the bonds were issued, except such portion as is applicable to the construction period. For principles governing amortization of discount, see section on "Mathematics." Prosperous concerns sometimes charge the whole amount of discount against Surplus, which, although conservative, is not the best practice.

18. OTHER ITEMS.—Among deferred assets may be included costs of large advertising campaigns, and prepayments of rent, taxes, etc. If advertising is capitalized, it should be written off over a comparatively short period. Its amount should be clearly set forth in the balance sheet.

ANALYSIS OF LIABILITIES.—Valuation is not of much significance as applied to liabilities. The problem is chiefly one of classification and of inclusion or exclusion. Strictly speaking, **capital stock** and **surplus** are not a liability, but must be considered along with the liabilities in interpreting the balance sheet. Liabilities are **fixed** or **current.** It is customary to regard liabilities as fixed if more than one year intervenes before they fall due, but this distinction is arbitrary. **Bonded indebtedness** is evidenced by bond issues, of which there are sometimes several. If a careful study is being made of a balance sheet, copies or abstracts of the trust deeds giving details of the issues should be secured.

Important considerations are: security, interest rate, and maturity. The full amount of bonds authorized should be set forth in the balance sheet, the unissued portion being shown as a deduction from bonds authorized. All pledges of property under bond issues should be investigated if not clearly set forth in the balance sheet. Owned securities pledged as collateral, if not clearly set forth, should be investigated. In some corporation reports these facts are set forth in detail in schedules attached to the balance sheet.

Mortgages are in some respects similar to bonds. They amount to a transfer of title as a guaranty of payment.

Notes payable usually have less than a year to run, and so are current liabilities. **Acceptances payable** are the equivalent of notes payable and may be included under that caption.

Accounts payable represent debts on open account, owing to trade creditors. Frequently these form a relatively large proportion of total liabilities. They should be considered with special reference to assets available for their liquidation.

Taxes accrued should include the amount of income tax estimated to be accrued to date of balance sheet; or this may be taken care of by a separate reserve.

Dividends become a liability only after formally declared and published by the board of directors. Unpaid dividends accumulated on preferred stock but not yet declared are not liabilities. This amount should be indicated in a footnote.

Deferred liabilities (sometimes called "deferred credits to income") are items received but not to be regarded as income until a later date.

Contingent liabilities are those which become definite liabilities in the future only in case of occurrences which may or may not transpire, as, contingent liability on notes receivable discounted, and on securities of other companies guaranteed as to principal or interest, or both.

Analysis and Interpretation of Income Statements

FORMS OF INCOME STATEMENTS.—The narrative form is most frequently used. In it gross sales or earnings appear first. From these the various deductions are made, each one being a step nearer to net profit. In the **account form,** gross sales or earnings appear on the credit side and the various deductions on the debit side. It is more difficult to interpret and is used but little in published reports. Form 7 shows the income statement recommended by the Federal Reserve Board. Form 8 was submitted to the St. Louis Congress of Accountants, in 1904, by A. Lowes Dickinson.

TERMINOLOGY IN INCOME STATEMENTS.—There is great variation in terminology in published statements. **Profits, revenue, earnings,** and **income** are used synonymously sometimes. **Net profits** is applied almost always after depreciation is deducted. **Net earnings** is sometimes used before deducting depreciation. Consequently as between concerns these two items may not be comparable. Montgomery recommends the adoption of the terms **income statement, gross income,** and **net income** to the exclusion of others.[6]

Gross income means accruals from all sources, profits derived from sale of capital assets, and excess of previously created reserves over ascertained needs for such reserves.[7] It should be divided into three parts, viz.:

[6] Auditing, Theory and Practice, Vol. I, p. 298.
[7] *Ibid.*, p. 299.

FORM 7. Form of Income Statement recommended by Federal Reserve Board

1. Current gross income, or operating income. This includes gross sales less returns, discounts, and allowances. It is sometimes called "primary" income.
2. Gross income realized or accrued from other sources, as, profits from sale of capital assets, interest, and dividends. This is called "non-operating" or "secondary" income.
3. Unrealized income arising from undelivered sales, etc.

Gross sales means total sales of goods or services without deduction for returns, allowances, etc. Sales on approval and consignments-out should be excluded. They are a part of inventory. Neither should prepaid charges

Surplus carried forward		$.........

FORM 8. Form of Income Statement Submitted by A. Lowes Dickinson

on shipments be credited to sales. If it is the custom of the concern to deliver f.o.b. destination, outward freight and cartage should be deducted from net sales. If it is merely done occasionally, this item should be regarded as a selling expense.

Net sales means gross sales less deductions for returns, allowances, or discounts in excess of 2%.

Net income is balance of income after deducting from gross income all costs, charges, and expenses.

These **deductions from gross income** are listed as follows by Montgomery:

1. Current charges against income, such as cost of goods; cash discounts; allowances not fairly deductible from sales prices; selling, general, and administrative expenses; bonuses to officers and employees; bad accounts and reserves for doubtful accounts; adequate depreciation (when not included in cost of goods), depletion and ordinary obsolescence (if there is such a thing); insurance; proportion of deferred charges carried over as applicable to the current period (if not absorbed—as they should be—in the accounts to which they relate); property and similar taxes paid, accrued or estimated; and any other charges and expenditures properly chargeable to current operations.
2. Deductions from gross income for interest paid and accrued on borrowed money (but not interest on capital), federal and state income taxes, accrued or estimated.
3. Losses arising from sale of capital assets, and other extraordinary items affecting prior periods.

The division of expenses should also correspond to the division of income, viz., operating and non-operating.

Deductions from net income should include only such items as those which have no relation to the current period.

Surplus is credited with net income and charged with dividends and deficits.

In studying the income account the natural order is to consider, first, the **revenues,** and second, **expenses** and **losses.**

It is customary to deduct **returned goods** from **gross income** before stating same. This is done because such returns are equivalent to a reduction of amount of sales. Sometimes, however, returns are shown as a deduction from gross sales. In the first division of the income account should be shown only income resulting from normal operations. Inclusion of extraneous items of income destroys the value of the gross figure for statistical purposes.

Rebates and allowances may also be deducted before showing gross income, unless large, in which case they should be shown as deductions on the statement

Important considerations in studying the income statement are:

1. Treatment of bad and doubtful accounts.
2. Treatment of income from work in progress.
3. Treatment of departmental and intercompany profits.
4. Treatment of income from sale of capital assets.
5. Treatment of appreciated capital values.
6. Treatment of depreciation.
7. Treatment of trade and cash discounts.
8. Treatment of net income.

1. Ordinarily the estimated loss for the period on account of bad accounts receivable should be deducted in the administrative expense section. In any event it should be regarded as a cost of collection and charged accordingly.

2. On this point Montgomery says:[9]

---

[8] Auditing, Theory and Practice, Vol. I, p. 200.
[9] Auditing, Theory and Practice, Vol. I, pp. 314–315.

Earnings which are represented by completed transactions with trade debtors must be clearly distinguished from those earnings which are represented by transactions only partially completed, the results of which are in doubt. Except in unusual cases, no profit should be taken unless a cause of action has arisen which can be enforced against the debtor. In other words, if work in progress cannot be earmarked as being for a definite customer, or if it has not proceeded far enough to form the basis of an action, it must be taken into the inventory and valued as an inventory item and not as an account receivable. Ordinarily no profit or loss thereon should appear in the income account except when there is a definite change in values at the date of the balance sheet and accuracy demands a revision. If a revision is justified the result thereof must appear as a separate item; it must not be merged with realized income. But if work is undertaken "on order" and is proceeding satisfactorily, and if it is apparent that the estimated profit thereon will be realized, more or less, then it is permissible to take credit for the proportion of profit earned to the date of the income account.

3. All interdepartmental profits should be held in reserve until actually realized by sale. This does not mean that they cannot be considered for purposes of interdepartmental comparisons.

4. All profits resulting from sale of capital assets should be set forth separately. Preferably such items are carried to Capital Surplus to prevent their distribution as dividends. If not carried to Capital Surplus such items should at least be set forth separately, and if found desirable to pay dividends therefrom stockholders should be informed as to the facts.

5. Increased valuations through appraisals mean increased depreciation costs, therefore greater production costs. At time such increase is brought upon books, not an income account, but a special reserve account or Capital Surplus should be credited. Thereafter the proportion of depreciation applicable to this increased valuation should be charged against this special reserve or against Capital Surplus, as the case may be.

6. Depreciation is an operating cost and should be so shown in the income statement. Frequently it is omitted from the operating section of the statement and, if shown at all, is deducted from profits. Concerning obsolescence there is room for disagreement. Treatises should be consulted.[10]

7. Trade discounts are deductions from the invoice price, consequently do not appear in the income statement.

Cash discounts of 2% or less are properly regarded as a reward for prepayment and should be regarded as non-operating income. Higher rates should ordinarily be regarded as deductions from sales.

8. For treatment of net income, see section on "Net Income and Surplus."

PERCENTAGE COMPUTATIONS BASED ON SALES.—It is customary to base all percentage calculations in the income statement on **selling price.** However, there is no objection to the use of cost as a base if it is followed consistently. Dawson says:[11]

Profits are compared by means of percentages, and they may be either based upon cost or selling price. The more usual method is to make the calculation upon the selling price, but this is undoubtedly an impure method, mathematically regarded. In taking the sale price as the base, the profit is necessarily included therein—thus the base will vary with the profits, although the underlying motive of comparison by means of percentages is to reduce results to a common base.

This variation is, moreover, uncontrolled by any principle, being, in the case of a large proportion of profit, entirely disproportionate to the variation caused by a smaller rate of profit. As an instance, 10 per cent of profit computed upon the cost price is equal

[10] See Saliers' Depreciation, Principles and Applications, pp. 21–34.
[11] Accountant's Compendium, pp. 465–466.

to 9 1/11 per cent when the same result is taken on the selling price, but if 50 per cent of profit on cost prices be computed upon selling prices it will only show 33 1/3 per cent. Furthermore, as the sale price is composed of the cost price and the profit, the latter cannot exceed the sale price, from which it follows that a profit based upon selling prices cannot exceed 100 per cent, nor even equal 100 per cent, if the goods have cost anything at all. None of these impurities or limitations exist in connection with a cost price percentage. Of course, a given percentage computed upon the cost will always show a certain other percentage if the same result as regards profits is computed upon selling prices, i.e., 10 per cent based upon cost is at all times equivalent to 9 1/11 per cent of the selling price; 50 per cent of cost is always equal to 33 1/3 per cent of sale price; and so on. Therefore, so long as the rate of profit is under 25 per cent, and does not vary greatly, comparisons of results based on selling prices will not be as misleading as they would be otherwise, and may be adopted without great danger, provided the nature of the base upon which they are computed is always borne in mind. It is often urged that a sale price percentage is adopted on the score of convenience, the cost of the articles being difficult to ascertain on account of the difference of stocks and other obscuring elements. But the cost incurred in respect of the sales effected can be obtained by a simple expedient so soon as the amount of profit has been ascertained. As above stated, the cost and profit combined equal the selling price—therefore, if the amount of profit be deducted from the net sales, the cost of the goods sold must be the result, quite independently of the questions of purchases, differences of stocks, etc.

SECTION 7

INVENTORIES

Stock Records

PURPOSE OF STOCK RECORDS.—Main object is to handle greatest possible volume of business with least practicable investment in stocks. This involves consideration of turnover, i.e., the rapidity with which stock can be moved, thus avoiding unnecessary tying up of capital invested in stock. Shortages must be avoided. They cause delays in deliveries and consequent dissatisfaction. They may result in rush orders which must be executed at heavy transportation and delivery expense.

PROCEDURE.—It is first necessary to determine what the running inventory is to include. If there are both stores and worked material, these should be properly segregated. Supplies which can be secured outside at a moment's notice should not be included. In general, those stocks and supplies should be included which are indispensable to the productive process. All items of high value should be included to prevent waste as the result of carrying an excess amount.

There must be a thoroughgoing **system of stockroom control** to prevent withdrawal of stock without proper entry upon records. The **stockroom** should be located where it will be most accessible to all departments. None should be permitted in it except under personal supervision of the storekeeper, who must be held responsible for the stock. Where, as in small plants, the storekeeper has additional duties, the storeroom should be kept locked in his absence.

Items of stock are acquired as follows. On authority of a **purchase requisition** a purchase order is issued, a copy thereof being sent to vendor. He sends the goods, which are received by the **receiving department.** They are inspected and sent to the storeroom, where it is necessary to evolve some record on the stores or perpetual inventory record.

The **invoice** is received and checked by the purchasing department. Entry is made therefor in the **voucher register.** Stores or raw materials account in the general ledger is charged with stock purchased at end of each month, and credited with all materials withdrawn from stock, and it is here essential to secure co-ordination between the stores records and the general ledger account. The **stores records** are kept sometimes in the stores department; sometimes in the planning department. The danger lies chiefly in lack of co-ordination between the person responsible for the stores inventory and the accountant responsible for the accuracy of the general ledger. Material should be withdrawn from the storeroom only upon written authority in the form of a **requisition.** This should show quantity of stock withdrawn, what account is to be charged, and to what department it is to be delivered. Here pricing is necessary and here discrepancies arise because

the pricing may be done wrongly. If so, the credit to Stores or Raw Materials account in the general ledger is also wrong, and the balance of this account no longer represents true value of stores on hand. Much depends upon the designing of the stock record form and also upon the instructions drawn up for its use, especially the latter.

FORMS.—The forms to be used depend upon the character and size of the business. The essential forms are a **bin tag, a requisition,** and a **perpetual inventory form.** In large enterprises these may be elaborated upon. Changes in arrangement of the various forms may vary somewhat with the nature of the business.

BIN TAG.—Failure to describe each item of stock accurately is a common cause of failure of running or perpetual inventory systems. Each item should be given a **symbol number.** Various systems of symbols are in use. If the number of items is not large a simple system of numerals may be used. Cumbersome or inaccurate methods should be avoided. Form 1 is a simple bin tag form. Form 2 is one containing more detail.

PERPETUAL INVENTORY FORM.—Many different forms are in use. Form 3 shows a simple arrangement. Form 4 is designed to obviate certain difficulties in pricing which are liable to occur when some of the ordinary forms are used. Amounts received are brought into the "amount received" column and carried over and added to the previous balance in the "amount on hand" column. The price per unit of the amount received is entered in the "price per unit" column. Entries for succeeding receipts of material are similarly entered. When material is issued on requisition, the amount is entered in the "amount issued" column, and deducted in the "amount on hand" column. The price of valuing the material issued is taken from the "price per unit" column of the first line not checked in the second "Ck." column. This process is continued until the first amount is exhausted, after which the price is taken from second unchecked line in the "price per unit" column, and so on. Sometimes the requisition will exhaust one amount in the "amount on hand" column and require the taking of a part of the next. In this case the two prices may not be the same. The quantity requisitioned must in this case be split into as many parts as there are different prices and be priced accordingly. By this method calculations are simplified, and the total amount on hand is always shown. Any unused balance of a quantity received may be shown in pencil to simplify its use in connection with the quantities which follow. Materials should be issued on requisition at the same price at which they are charged when received. This price may be secured from the invoice or from the duplicate of the purchase order, providing it shows the correct price.

Form 6. Merchandise Stock Record
(From P. J. Esquerre, "Applied Theory of Accounts")

4. Quantity to be ordered when time comes to procure a new supply, by production or purchase.
5. Unit price at which the particular item of store is to be priced on requisitions.
6. Quantity consumed during given periods.
7. Value of stock on hand.

This information serves the following purposes:

1. Scientific planning of purchasing and production.
2. Enables factory manager to meet requirements of sales department.
3. Eliminates errors in ordering.
4. Reduces dead stock to a minimum.
5. Avoids excessive inventories.
6. Aids purchasing, by means of statistics of requirements.
7. Aids financial control, by affording a running inventory.

ADVANTAGES OF STOCK RECORDS.—Stock record sheets sometimes provide for maximum and minimum limits to prevent tying up of too much capital in stock. Not only must quantities of materials be sufficient, but deliveries must also be kept ahead of requirements in factory or salesroom. Stock records facilitate checking of receipts of stock against purchase orders or special contracts. Sometimes materials are contracted for long before delivery. In such cases it is especially important that the contracts be checked against the stock records to prevent malpractice in pricing of goods purchased. A good stock record system aids in elimination of wastes which occur when no systematic method of recording stock transactions is in effect. It facilitates bidding on contracts because immediate reference can be made to past costs. It aids in the settlement of fire loss insurance. Although book inventories carried at cost prices may not represent market prices at time of fire, they give invaluable evidence of quantity and value of losses. They aid in reduction of obsolete stock because they show date of receipt of stock and thus permit determination of age of different classes of stock. Financial statements can be prepared monthly and on a more scientific basis when book inventories are employed than when dependence is placed upon physical inventories or upon estimates.

STOCK RECORD FORM TO USE.—There are two ways of keeping the record: (1) loose-leaf books, and (2) loose-card files. The loose-leaf book is preferable in a highly developed system of control because the larger sheets permit entry of necessary data. Cards of large size are expensive and awkward. Under simple conditions a simple card system may serve, and is preferable to small loose sheets. The loose-leaf principle is essential for speed in handling. Stock records kept in bound books are inelastic for indexing purposes, and it is impossible to allow the proper number of consecutive pages for given classes of stock. New sheets cannot be inserted for new material. The bound book necessitates a cumbersome index.

ORDERING QUANTITY AND ORDERING POINT.—In many modern establishments the **maximum** and **minimum** points have been displaced by the **ordering quantity** and the **ordering point.** The ordering quantity is the smallest amount advisable to purchase at one time. To determine this it is necessary to consider the time required to secure the new stock, cost of beginning production, etc. Cost of storage, etc., determine the upper limit. The ordering point is the amount needed to meet somewhat more than the average requirements, while the new stock is being procured. Sometimes a **danger point** is also indicated. When the quantity on hand

gets down to the danger point, investigation should be made to determine that the quantity ordered is coming in on schedule.

RUNNING TOTALS.—Tests made show that **balances** are not used nearly as many times as they are computed. As a consequence the **running total** method is being adopted. By this method any figure is available by a simple process of subtraction, and the clerical work is **addition,** except when a balance is required. **Running totals** give quantity to date as well as balances. Form 5 is designed without balance columns.

ORDERING NEW MATERIAL.—Before ordering new material an investigation should be made to see that there are no materials on hand which would be suitable. Only that which is to be standard material should be permanently included in additions to inventory lists. Usually stocks not to be replenished are placed in **unclassified stores.**

Form 7. Order to Stock Material

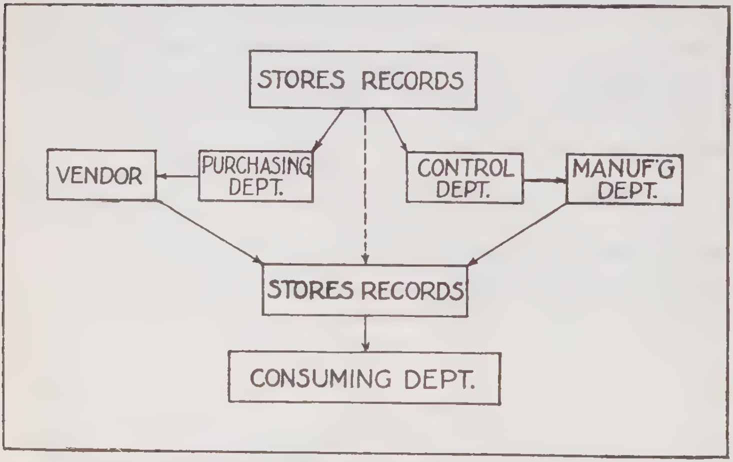
(From Madison Cartmell's "Stores and Materials Control")

To authorize the purchase of **new** stores, an **order to stock material** is the authority. (See Form 7.) This form gives description and definition of material, initial and probable future consumption, and other details helpful to determine **ordering point** and **ordering quantity.**

DISCREPANCIES IN STOCK RECORDS.—Book records are frequently found not to agree with actual inventories. This may be due to breaking up of bulk packages in order to issue to departments the exact amounts requisitioned. Thus, in manufacturing paper large amounts of sulphur are used. The amount indicated on the stores requisitions as delivered to producing department is usually considerably less than the amount actually delivered, because of loss in breaking up bulk quantities and because there is a tendency to add a small excess to the amount requisitioned.

When such discrepancies appear, the **tally card** should be adjusted and necessary corrections should be made in the stock records as to quantity, but no change should be made for book value of stock on hand. Thereafter quantities withdrawn should be charged against production at a somewhat higher unit cost than before the adjustment was made. Thus, if the stock records for a certain type of bolt whose purchase price is 2 cents each, shows, before adjustment, 200,000 bolts with a book value of $4,000, and if an actual count shows that there are 199,800 bolts, then the quantity should be corrected to read 199,800 bolts, but book value should be left at $4,000. Thereafter when bolts are requisitioned they are charged at a slightly higher amount per bolt.

If the discrepancy is large, it may be due to dishonesty of employees. Pending an investigation the discrepancy should be removed from the



FORM 8. Chart showing the Parallel Procedures for Procuring Materials by Purchase and by Manufacture

(From Madison Cartmell's "Stores and Materials Control")

stock record or raw material ledger, by means of a journal entry crediting "Raw Material" for the amount of the discrepancy and charging an "Inventory Adjustment" account. In the stock record the account in question should be credited. At the end of the accounting period the Inventory Adjustment account in the general ledger should be closed into Profit and Loss as an item of expense. It should not be considered as a charge to production.

ORGANIZATION FOR MATERIALS CONTROL.—The materials control department in a large enterprise occupies a position in relation to control of materials similar to that of the personnel department in relation to control of men. Its head should be responsible to the chief of the production organization. The function of the materials control department consists not only in keeping stock records, but also in laying out and scheduling production orders for producing department and purchase orders for pur-

chasing department. It studies sales orders in order to lay out its program of future requirements. To enable production orders to be executed promptly, the control of materials department should see that required materials are delivered promptly at the proper place. Size of plant must govern methods adopted for storing and issuing materials. The stockroom may be centralized or decentralized, according to size and layout of plant. In manufacturing, the present approved practice is frequently to have sub-storerooms and to separate stockrooms for manufactured parts and finished goods from that for raw materials and supplies. Certain heavy or bulky articles need be stored only in a technical sense, being in reality left in sheds or out of doors. The relationship existing between the materials control department, the stores records, and the other parts of the organization are indicated in the following diagram (Form 8).

STATUS OF CONTROL DEPARTMENT.—Process of ordering begins with determination of need for materials or supplies. This need is expressed by a requisition upon the storekeeper for the desired materials or supplies. This requisition first comes to the clerk in charge of the controlling stores records, who ascertains from records whether the article called for is in stock; if not, whether it is to be purchased or manufactured. If it is to be purchased, the purchasing department is called upon to procure it. If it is to be manufactured, the control department starts a requisition order and accompanying papers to initiate its manufacture. Through either route the required article reaches the stores department and is entered on its records, thus completing the cycle illustrated in the diagram above. All details of orders for articles to be made by the various departments pass through the control department.

INVENTORY UPKEEP.—To keep inventories of stock at proper levels it is necessary to know: (1) quality or grade necessary, (2) quantity required, and (3) time when needed. The question of quality is an important one, in some cases requiring tests and research. Usually it is sufficient to reduce the requirements to exact specifications, which are kept on file and used as standards in purchasing materials which must fulfil certain requirements.

The **quantity** to be kept on hand must be determined by present and future requirements, taken into consideration in connection with the time required to procure additional quantities by purchase or manufacture.

Inadequate storage facilities is a frequent cause of failure of perpetual inventory systems.

Proper inventory upkeep necessitates the co-ordination of the production program with future estimated sales. If future sales are based on careful calculation, it will be possible to avoid great waste as the result of inadequate or excessive purchases of materials. Materials control, therefore, really begins with a consideration of future sales. The sales program must, however, be made to agree with the productive capacity of the plant. Production should be controlled by statistical estimates of future requirements, as affected by the future sales program and by financial limitations. There should also be compiled regularly statistical reports concerning the amount of capital tied up in inventories, as well as concerning materials consumed and materials ordered but not yet received.

CLASSIFICATION OF INVENTORIES.—For purposes of establishing adequate control, the inventories should be classified into as many groups as conditions warrant. The following is a typical classification:

1. **Raw materials** and **supplies** (or, general stores) include materials purchased outside and not as yet put through any manufacturing process; also certain supplies.
2. **Worked materials** include materials partly or completely processed.
3. **Finished product** includes manufactured products ready for shipment.
4. **Scrap** and **salvage** include materials not needed or which are unusable.

PRICING STOCK RECORDS.—In some systems values are not carried on stock records. When values are carried, requisitions can be placed at actual cost. To insure accuracy a systematic method of checking up should be instituted. Each item in the stock ledger should be checked at least once a year. Cost of stock is the invoice price plus transportation charges. It is difficult to distribute storage charges over stock on hand. They may be included in general overhead. When costs are not received until after requisitions are made, estimated costs should be used and an adjustment made later. Preferably, prices should be predetermined. This can be done by having the purchasing agent ask for quotations before sending the purchase order, especially if material is to be sent f.o.b. destination. It is necessary, of course, to subtract trade discounts. Adjustments must then be made if prices are changed.

In **pricing requisitions** two methods are followed: (1) use of **actual price** of each lot of stock as long as it lasts; (2) use of an **average price** of two or more lots. The first is an **actual cost** method; the second is a **standard cost** method. The tendency is to adopt standard costs because it permits comparisons to be made between firms in the same line of manufacture. **Actual cost** should be used where materials are purchased for a specific order; also where a staple of one general kind is in stock but varies in quality. Frequently the oldest record price is used, so long as the stock to which it applies is not exhausted. When it is exhausted, the next recorded price is used. When the **average price** is used, the average must be recalculated each time new material is received.

THE STORES REQUISITION.—A stores requisition is an order for the delivery of materials from storeroom to factory. It should provide for a symbol of the account to which the material is to be charged, the amount of material and its description, the name of the department to which it is to be delivered, when delivery is to be made, and signature of party authorizing it. Form 9 is a typical stores requisition blank.

Stores requisitions should originate in the **production control department.** All requisitions should be scrutinized by the storekeeper for errors. In some cases it is desirable to limit the amount which can be sent out on one requisition, especially if the material possesses considerable value. After the material is issued, the requisitions are forwarded to the control department where they are sorted according to symbol for posting. Posting is made to stock ledger cards or sheets, the requisition first being priced, and extensions made. **Unused material** is returned to the stockroom accompanied by a **stores return** showing account to be credited. This stores return is then sent to the control department. The price on it should agree with the price at which the material was requisitioned.

CHECKING UP STORES RECORDS.—Checking up quantities requires **a physical count.** The bin tags furnish one method of checking up, but

these may be wrong. Inaccuracies arise from various sources—carelessness, mistakes in description, and so on. One good method of checking up is to make a physical count of a given material each time a requisition against it is filled. Discrepancies should be adjusted either by correcting original entries or by writing off the difference to a Stores Inventory Adjustment account.

CLASSIFICATION AND SYMBOLIZATION.—Classification and its expression by means of symbols is an important feature of inventory control. It should be reduced to a unified system. This necessitates a careful grouping of all activities. The accounting records usually give an insight into the fundamental activities; therefore, fundamentally the system of classifi-

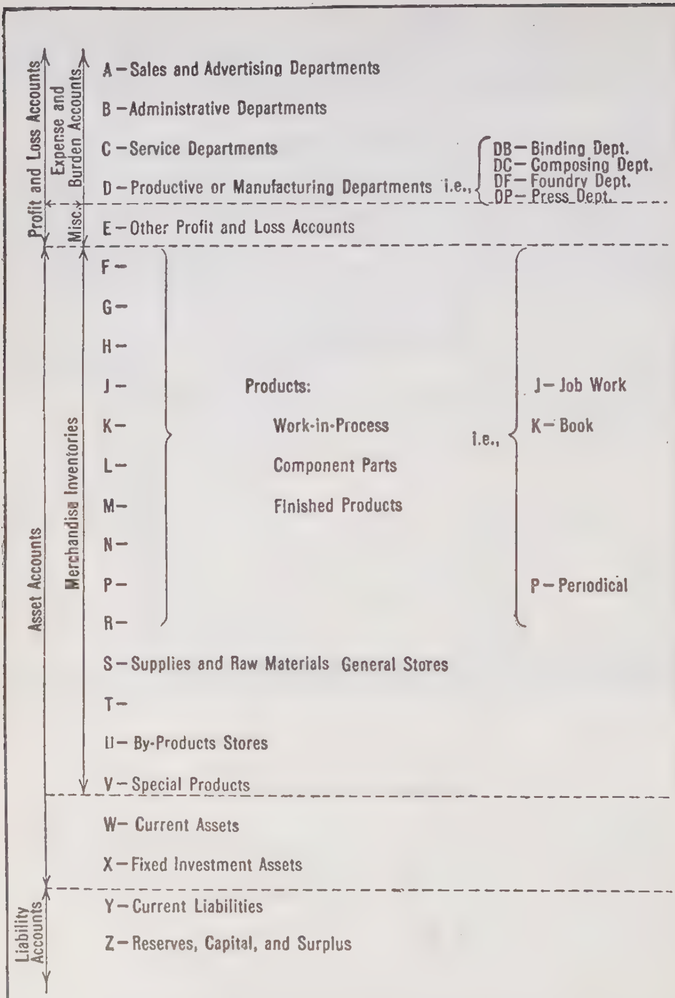
cation should follow the order of accounts shown in the general ledger. All items being grouped under their proper classification, each item should receive a distinctive symbol and description, and each should have a distinctive place in its own group. Within groups the plan of classification must be determined upon a logical basis.

A **symbol** is a concise form of accurate description of a given object, and usually consists of letters, or numbers, or both. Symbolization consists in the permanent identification of the elements in the final classification. It is an important step in standardization of materials.

Symbol systems may be based on letters or on numbers. Those based on numbers are similar to the **Dewey decimal system.** It is preferable, for inventory classification, to use a combination of the two. The **numerical system** permits of the 10 basic classifications. The **alphabetical system** permits use of 23 letters, I, O, and Q not being used because they resemble numerals. Each item must be represented by but one symbol, and each



Form 10. Chart showing Classification and Symbolization of Main Accounts (From Madison Cartmell's "Stores and Materials Control")

symbol must represent but one item. If possible, symbols should possess suggestiveness, as, S for supplies, etc.

Standardization of stock or stores must precede their symbolization.

The establishment of **control accounts** must be based upon a logical classification of **stores ledgers.** A possible division of the stores ledger would be: general stores, component part stores, finished product stores, and by-product stores; but specific conditions must govern. Corresponding **controlling accounts** should be set up in the general ledger. Charges to this general ledger control account are made at the end of each accounting period, postings being from the purchases journal or voucher register, whereas entries in the subordinate ledger may be posted from vendors' invoices.

PROCEDURE FOR SYMBOLIZATION.—The accompanying chart (Form 10) shows the basic classification of main asset and liability accounts. Letters of the alphabet symbolize the main classification. Numerals should be used to denote subclassifications or such as cannot be effectively represented by means of combinations of letters. Note that S symbolizes the general asset account, Supplies and Raw Materials, and D represents productive departments. Therefore, SD symbolizes supplies for a productive department. Similarly other combinations may be used, as:

SA—Supplies for sales and advertising department.
SJ—Raw material for job work only.
ST—Tools.
etc.

Each of these general classes permits of further subclassification. Thus if SC represents service department supplies, then within this departmental classification:

SCJ—Supplies used by janitor's department.
SCS—Supplies used by shipping department.
etc.

The shipping department uses binding materials, as, string, cord, rope, and gummed paper tape. These may be symbolized:

SCS1B—String used by shipping department to bind packages.
2B—Cord used by the shipping department to bind packages.
3B—Rope used by the shipping department to bind packages.
4B—Gummed paper tape used by shipping department to bind packages.

Inventory Control

INVENTORY CONTROL.—This involves such problems as the consideration of the quantity desirable to carry, determination of the ordering points, handling of carrying charges, use of graphs to show consumption, and so on.

CARRYING CHARGES.—These include taxes, depreciation, rent, insurance, clerical and manual labor, and interest on the investment. It is estimated that they amount to from 10% to 20% per annum on value of stock. In practice it is impossible to include them as a part of inventory costs, although theoretically they should be included. These should be considered in determining upon advisability of carrying large stocks.

ORGANIZATION FOR CONTROL.—Proper inventory control requires method and organization. The plan must be simple but thorough, and must

provide for handling of increases and decreases in stock efficiently. It must provide accurate, up-to-date statistics and data.

ORDERING POINTS.—Maximum points for the various classifications are managerial problems. Factors to be considered are: financial conditions, unfilled sales orders, turnover, etc. In falling markets inventories should be reduced as much as is consistent with safety. In rising markets heavy purchases should be made. Determination of amounts below those of general classification must be left to subordinates, acting under instructions.

The **minimum ordering point** is determined by what can be economically ordered and stored. This involves consideration of many factors. The **upper limit** is determined by the sales budget. Requisitions for additional supplies should be considered in connection with these.

The following description of a method for determining the minimum limit of stores is adapted from "Business Statistics," by M. T. Copeland:[1]

To set a minimum it is necessary to examine factors which affect exhaustion and replenishing of stock. Of these there are twelve possible cases but it is rarely necessary to consider more than three or four in a given instance. The twelve are as follows: the unit of time being the week and the unit of quantity the one decided on as the standard for **balance-of-stores record:**

- (a) Time required by the purchasing department to place an order after receiving a purchase requisition from the balance-of-stores clerk.
- (b) Time required by the seller to ship the goods after receipt of the purchase order.
- (c) Time required in transit.
- (d) Time required to pass goods through the receiving room and to the desired point in the manufacturing department.
- (e) Time required to manufacture goods.
- (f) Time required to ship goods after being manufactured.
- (g) Time required as a factor of safety.
- (h) Average quantity consumed per week.
- (i) Balance on hand.
- (j) Quantity on order.
- (k) Maximum quantity that a single order might require.

Let L = the allowable minimum quantity.

Using the letters indicated above, the sum $(a+b+c+d+e+f+g)$ equals time in weeks required to secure raw material and manufacture a lot ready for shipment. This sum multiplied by h gives quantity sold during time required to replenish stock. It might, therefore, be expected that if the balance-of-stores clerk made out a requisition on purchasing department for raw material when this quantity was left on hand, the new lot would be ready just as the old lot was used up. There must, however, always be enough on hand to fill the maximum order that might be expected, so the factor k is added. It often happens that the quantity to order is small and the time required to obtain raw material is long. In such cases, the factor j must be subtracted. The complete general formula then becomes,

$$L = (a+b+c+d+e+f+g)\,h+k-j,$$

and a requisition should be put through as soon as i becomes less than L. It is not necessary for the balance-of-stores clerk to figure an elaborate formula of this kind. When all of the quantities, a, b, c, d, e, f, g, h, k, remain constant, or nearly so, over a period of time such as a year, the formula need be figured but once and the minimum specified on the record as a number. When, however, one or more of these quantities varies enough to warrant the extra work on the part of the balance-of-stores clerk, the formula should be specific on the record, using words instead of letters, as very few clerks will readily comprehend the significance of algebraic symbols.

The quantity b may be regarded as varying, so that it must be considered. This would be true, for instance, in case bar steel were the raw material. This sometimes may be had from the mills in 2 weeks and sometimes it requires 6 months. It is obvious that it would

[1] Pp. 436–439.

be foolish always to keep a 6 months' supply on hand, yet the supply must come in regularly. This is accomplished by having the purchasing department make monthly or semi-monthly reports to the balance-of-stores clerk regarding the time it takes to get delivery. The purchasing department is instructed to add a factor of safety which shall cover the quantities a and c as well as g. The balance-of-stores clerk should periodically compute h on all items and make such corrections as are required. The quantity k, so far as these specimen duties are concerned, is considered very small and may, therefore, be neglected. The quantity j does not often enter into the calculation, and, when it does, is considered by specifying that a requisition should be put through when sum of goods on hand and on order becomes less than prescribed minimum. It is thus seen that this apparently complicated formula resolves itself for the case in point into a consideration of but two quantities. After the balance-of-stores clerk has figured a few items by this method, he can usually tell at a glance whether a requisition should be put through. The person setting the minima should make himself very familiar with the theoretical formula as given and should reduce this to simple terms covering specific cases which may be practically applied by the balance-of-stores clerk. There are probably several hundred different ways in which this formula may be reduced to practical application. By its intelligent use, however, it is possible to keep but a relatively small amount of stock on hand and yet be sure of an adequate supply.

The **maximum** is, of course, the sum of the minimum quantity and the quantity to order. The quantity to order is dependent on five factors. These are as follows:

P. Average weekly consumption.
Q. Set-up cost plus loss of profit, if any, due to idleness of machine.
R. Shop cost (except preceding item) per unit.
S. Rate of interest plus rate of depreciation, both per week.
T. Storage charges per unit per week.
Let X = quantity to order.

It costs as much to get ready to make a run of goods if only one piece is made as if a thousand are made, or whatever quantity can be turned out without resetting a die or making other changes. Consequently, the more goods which can be manufactured in one lot, the lower will be the cost. But if, as is usually the case, these goods must be stored in the warehouse for some time until sold, there is an expense occasioned for warehouse space, and money is tied up, the interest on which should be charged against the goods, and there is usually a loss through depreciation. Thus, so far as storing the goods is concerned, the more made at a time, the higher the cost. These two forces pull in opposite directions. There is a point where cost is a minimum. If quantity run be smaller than this amount, increased cost per unit, due to distributing set-up charges over fewer pieces, more than offsets reduction in cost of warehousing. On the other hand, if quantity run be greater than this minimum, warehouse expense more than offsets saving in manufacturing cost. **Calculus** makes it possible to determine the formula which expresses quantity to order so that sum of manufacturing and warehouse expenses shall be a minimum. Expressed algebraically this formula is:

$$X = \sqrt{\frac{2PQ}{RS + T}}$$

To find proper quantity to order in any particular case, substitute proper figures and solve by arithmetic. No knowledge of calculus or algebra is required to use this formula. Great care should be taken in getting the units correct. The same unit of quantity must be used for P, R, S, T. Costs must be written as dollars and decimal parts of a dollar. For instance, if shop cost is 6 2/10 cents per unit, it must be written $.062. If proper care is taken regarding units of quantity and money, it is easy to figure the right size run to make on each item to give maximum economy. This formula is of greatest service in connection with expensive, bulky, perishable goods, with a high set-up charge, and of least service when reverse is the case.

Graphs are helpful in studying ordering points. Quantities consumed should be expressed on one scale, preferably the ordinate, and time on the other scale. A glance at the graph shows trend of consumption, preferably by monthly periods, and thus enables making of changes in the **ordering point** and **ordering quantity.** Following quotation and chart are from Cartmell's "Stores and Materials Control" (pp. 137–138):

FORM 11. Graphic Record of Consumption
(From Madison Cartmell's "Stores and Materials Control")

As an aid to the forming of a correct judgment when an item of stores reaches the "ordering point," its consumption should be reviewed to see if a change has been made expedient by changing conditions. Form 11 is designed to make such a review easy. The lower part of the form graphically presents the record of consumption for a period of 2 years. Whenever the stock falls to the ordering point, one of the cards is made out to show the consumption to date. From left to right the lines represent the months, while from the bottom to the top, the spaces are for the quantities consumed, using whatever scale best suits the case. The spaces above the graph are filled in by the stores records clerk and by a person familiar with the securing of the material, such as a member of the purchasing or the production control department.

When the executive of the control department responsible for the "ordering quantities" and "points" studies this chart, he is able to tell at a glance the trend of the consumption for the period charted. This information, with his general and his specific information of future manufacturing requirements enables him to make any needed changes in the ordering point and ordering quantity. If a change is made, the new quantities are placed on the stores record and the proper action taken, while the chart is filed by its symbol until the ordering point is again reached. Then the consumption curve and other data are brought up to date and the card is again ready for the decision of the reviewer.

Expense of maintaining these graphs is slight. The cards can be used again and again and little time is needed to bring them to date. The system has been used at a weekly cost of about \$30 in a stores organization handling over 20,000 items inventorying over \$400,000. Inventories were cut \$100,000, saving at least \$10,000 in carrying charges alone—and the operating cost was \$1,500 a year.

Material in process should be carefully controlled to prevent it from becoming excessive in quantity. **Drifting** must be avoided. A **maximum limit** for quantity of work in process should be established.

STANDARDIZATION AND SPECIFICATIONS.—These are important factors in inventory control. Standardization applies to both materials and methods. As to methods, standardization applies to ways of handling and storing materials. Standardization of materials permits reduction of inventories, since the bulk of most trades is done in comparatively few styles. During the war automobile tire manufacturers agreed to reduce the number of styles from 287 to 32. In manufacturing, standardization reduces the number of production orders, hence reduces work of making specifications, etc. Larger purchases of materials can be made at one time and unit costs thus reduced. In determining a **standard material** it should be studied from three points of view:

1. How many uses can this material be put to and in which departments can it be used?
2. What other materials resemble this material and can the one be substituted for any other?
3. What quality of this material will be good enough for the purpose it is to serve?

Standardization should be carried out at the time classification is established.

Standardization necessitates **specifications,** i.e., written description of each characteristic of the material standardized. Standard specifications have been established for many basic commodities. These may be secured, for example, from the catalogs of manufacturers and dealers and from the bulletins of the U. S. Bureau of Standards. The following is an illustration:

Cotton drilling:
Unbleached—
44 inches; on sample and specifications......................

Material.—Shall be made from long-stapled, sound-fiber cotton, free from shives, motes, or adulteration.

QUALITY.—The fabrics shall be a good quality, evenly spun and woven, and commercially free from faults.

WIDTH.—Shall be not less than 44 inches nor more than 45 inches when finished.

WEIGHT.—Shall be not less than 12 ounces per linear yard.

CONSTRUCTION.—Shall be not less than 54 threads of warp nor less than 46 threads of filling per inch in the finished cloth.

TENSILE STRENGTH.—The warp shall be not less than 100 pounds, and the filling shall be not less than 90 pounds.

FINISH.—The fabric shall be soft finish and shall be free from "loading" of any kind.

Standards require occasional revision to meet varying conditions and demands.

ARRANGEMENT, ETC., OF STOCKROOM.—Materials must be kept in good condition and accessible; also so as to permit handling with minimum of time and effort. This requires careful allotment of space to different materials, with aisles properly located. Cartmell (p. 157) suggests the following to be kept in mind in arranging layout:

"1. Methods of placing and removing various classes of items should be reduced to standards. This requires uniformity of method both as regards stowing units of lots and the separating of lots so that the oldest may be used first.

2. The equipment should be flexible and interchangeable for varying conditions.

3. Every item should be properly placed. The location is governed by the difficulty of handling, the quantity in stock, the frequency of use, and various special considerations of perishability, safety, or similarity to the storage problem of other materials.

4. All goods should be clearly identified before being stowed. This includes a tag for every lot and a label for every unit or package.

5. All goods should be stowed in issuable units and placed to show the greatest possible number of individual units or packages.

6. Each item (and each lot whenever practicable) should be kept distinct and separate from every other item and lot.

7. The installation of proper equipment which will aid in handling items in a minimum of space, of time, and of effort."

Cartmell also gives following as sequence to be followed in planning new storage areas:

"1. The listing and classification of all items expected to be stored according to problems of:

(a) Measurements.
(b) Difficulty of handling.
(c) Frequency of use.
(d) Special considerations, as of sensitiveness, perishability, or of peculiar similarity.
(e) Quantities to be carried.

2. Determination of ample storage space to be required.
3. Determination of proper unit storage space.
4. Determination of proper aisle spaces.
5. Determination of proper location in relation to departments served.
6. Determination of proper layout of storage and aisle space as related to general location of classes of items and area of total space available.

7. Lastly, the planning of structures so that entrances, aisles, posts, platforms, windows, and other necessary features will not interfere with, but will facilitate the most desirable layout of the stores themselves."

These should be reduced to written instructions. With addition of instructions for handling, they constitute complete instructions.

In **locating the stockroom,** the aim should be to keep the movement of material in one direction as nearly as possible. Stockroom for each class of material should be as close as possible to the delivery point. This simplifies trucking problems. Aisle arrangement governs storage space. For shelving, 24 inches is a suitable depth. For articles placed upon the floor, 6 feet is a good width for a row. Main aisles must permit passing of trucks; connecting aisles should be one-way width. Standard width between bins where contents are handled by hand is 30 inches. Aisles must be kept unobstructed. Inadequate space is a serious defect in a stockroom. Division of space into sections is advisable, each section for an allotted purpose. Outline of each may be marked by lines painted on floor. These lines may be as much as 3 inches wide. Adequate room is necessary for sorting. In case of finished goods storeroom, adequate space must be supplied for packing. Direction of main aisle should conform to direction of maximum travel. Sub-aisles should be at right angles to these as well as to the source of light. Storage spaces should be symbolized to enable easy location of materials. Number each row of bins, even numbers on one side of aisle, odd numbers on the other side of aisle. Then number each section of each row of bins, beginning at main aisle. Place odd numbers on one side of aisle; even numbers on other side. Next, number each section of each row of bins, beginning at main aisle, odd numbers on one side of aisle, even numbers on other side. Give to each tier in each section a letter. This should appear in the index between the two numerals. Thus, "24B7" might be next to the top tier in 7th section of 24th row. A chart of layout and symbolization should be pasted in a prominent place in the stockroom. An index file of location of each article should also be prepared.

A **standarized rectangular storage space unit** is desirable, as it permits a high degree of interchangeability and flexibility. Of **bin subdivision,** Cartmell says (p. 165):

The best **shelving for bins** is constructed of standardized steel parts which can be adjusted to form a storage space of any desired size and opening by the simple operation of bolting a few steel sheets and bars to a frame. All parts are standardized and interchangeable, easily and quickly erected or taken down. The stacks may be made up singly or arranged in series in rows. For instance, a bin, 24x24x24 inches inside, gives opportunity for a wide variety of subdivisions 24 inches deep whose other two dimensions will be even fractions of 24 inches.

The advantages of this shelving are many. Its mobility and its convertibility into convenient receptacles for handling widely varying types of material, its great strength, its economical use of floor space, and the fact that it is fireproof and practically indestructible, make it especially desirable. It can be purchased in sections and added to as conditions require. Changes of location and arrangement are easy to accomplish with this standardized equipment, without serious interference with the necessary work of the storeroom and without the charges for labor and new material which inevitably follow alterations on wood construction.

STOWING MATERIAL.—Stowing of material should be standardized. Proper subdivisions of space must precede stowing. Under the **double-space system,** double the amount of space normally needed for the quantity of a given material is set aside to receive it. This avoids necessity of separate storage space. Under the **single-space method,** additional storage must

frequently be sought elsewhere. Special items should receive special attention. Give heaviest items the shortest hauls, store them nearest the floor, etc. Articles used together should be stored near each other. Identify packages, etc., by labels wherever possible, placing them preferably on ends of packages. **Bin tags** are used for material stowed in stacks and bins. They are made out on receipt of material; and show symbol, quantity, etc. Form 2 (p. 348) shows a bin tag with spaces, quantities, balances, etc.

The bin tag should be placed in a **bin tag holder** kept in a conveniently accessible place in or near the bin. If surplus stock of given kind must be kept in another place, a **surplus stock tag** showing its amount and location should be placed in the bin tag holder.

Rules for Piling, Counting, etc.—

1. Place goods all one way, unless desirable to reverse or cross-pile for stability.
2. Lay goods with their ends out towards the aisle.
3. Place labels all one way to make for ease in counting, etc.
4. Place articles in defective wrappers last to permit removal first.
5. If possible, store goods in packages containing quantities customarily used at one time.
6. In piling, begin stowing at back left-hand corner and vertically until one column is completed. Bring first row of such columns to front and complete it. Start second row in farthest left-hand corner, and proceed in same manner.
7. To aid in counting, keep columns, stacks, etc., uniform. Allow only last column, stack, etc., to remain incomplete. Cubical piling is preferable to pyramidal piling.
8. In a full pyramid, quantity equals product of number on bottom tier times number of tiers plus 1 divided by 2.
9. Pile in groups of five and do not break groups to fill up space.
10. In removing, take in order of age, beginning with the oldest; but clear any aisle spaces or incomplete piles first.

Turnover

DEFINITION.—Turnover is the number of times capital in the form of stock-in-trade is reinvested in stock-in-trade during a given period.

TO FIND TURNOVER.—Montgomery gives the following rule for ascertaining turnover:[2]

> To ascertain the turnover, take the starting inventory, add the purchases or cost of manufactured goods, and deduct the inventory at the end; divide the total by the starting inventory. The calculations are based upon a normal inventory. The result is the number of times the capital invested in stock-in-trade has been turned over during the period. In the event that the value of the inventory throughout the year varies considerably, or in case of a continuous increase or decrease in the volume of business which might have a corresponding effect on the inventories, a more accurate method of determining the turnover would be to use the average inventory instead of the starting inventory.

This method does not make allowance for variations in the amount of inventories from month to month. Thus, if the starting inventory in a given year is $25,000, purchases amount to $400,000, and inventory at end of

---

[2] R. H. Montgomery, Auditing, Theory and Practice, Vol. I, p. 445 (1921 Ed.).

year is \$50,000, the turnover for the year is 15, because \$25,000 + \$400,000 − \$50,000, or \$375,000, is fifteen times the first inventory. If, in the year following, starting inventory is \$50,000, closing \$25,000, and purchases during year \$375,000, turnover is 8, because \$50,000 + \$375,000 − \$25,000 is eight times the opening inventory. The difference in the inventories at the beginning and close of the year may be largely accidental, yet the difference in the result is so great that, unless inventories are quite normal and unvarying from month to month and year to year, it is necessary to modify the method of computing turnover.

This may be done by ascertaining normal quantity of stock-in-trade carried, which may be either greater or less than the inventory at beginning of the year. To do this it is necessary to take an inventory at monthly or other intervals during the year. The average of these may be regarded as the normal inventory.

PROPER BASIS FOR TURNOVER.—Following Montgomery, most American accountants figure turnover on the basis of cost, i.e., they regard turnover as the number of times the normal stock-in-trade is reinvested in the goods sold. Many British accountants, on the other hand, say that turnover is the number of times the inventory is contained in the sales. It is evident that when two or more businesses are compared, it is very important that the turnover be determined for all on the same basis.

Some authorities suggest working capital as a basis for turnover. This is the excess of current assets over current liabilities. This is a comparatively stable figure and therefore affords a more stable basis of comparison. Thus, if the excess of current assets over current liabilities is \$25,000, and goods are sold during the year which cost \$150,000, the working capital is turned over six times, and this may be said to represent the turnover. If a large amount of working capital is used for advertising purposes, it follows that it cannot be used to purchase goods to be sold. The same is true if a large amount is locked up in accounts receivable. The result of either of these is a lessened turnover of working capital. When the opening or normal inventory is made the basis, the turnover may remain the same although the volume of business is on the increase or decrease, because the inventory increases or decreases with the expansion and contraction of business.

Walton and Finney make the following statement regarding the use of working capital as the basis for the reckoning of turnover:

> The use of working capital as the basis of turnover is logical, first, because the capital is put in the business for the purpose of being turned over as rapidly as possible; second, because it is virtually constant; and third, because it presents all the elements concerned in the turnover, not only the stock-in-trade, but also the accounts and notes receivable, by means of which the turnover is effected. The turnover of working capital also furnishes a better criterion of the excellence of the management. With the inventory as the only standard, a manager can make an apparently good record by storing his stock-in-trade. If, however, he uses working capital as the standard, he makes his best record by diligence in collecting outstanding accounts, and increasing the supply of cash for the development and handling of a more extensive business.[3]

The following is based on material supplied by J. H. Bliss:

> In the **retail business**, turnover of inventories should be figured by dividing average inventory at cost, averaged monthly, into cost of sales for year. In some instances where **retail method** of estimating inventories is used and retail inventories are available, the inventory at retail, averaged monthly, divided into sales for year, gives turnover figure. While turnover can be figured in a rough way by dividing inventory at cost into sales, it

---

[3] S. Walton and H. A. Finney, Mathematics of Accounting and Finance, p. 87.

is not a correct turnover figure. If a wide gross margin is realized on goods, the turnover is considerably affected by this plan. To get a correct turnover figure, inventory at cost should be divided into cost of sales or inventory at retail into retail sales.

In a **manufacturing industry,** turnover of **raw material** is determined by dividing average inventory into amount going into process during year. Turnover of **goods in process** is found by dividing average inventory of goods in process into total amount credited to goods in process account for year. Inventory of **finished goods** is found by dividing average inventory of finished goods into cost of sales.

In a **departmentized organization,** turnover should be figured by departments.

If a **general or average turnover** is desired for a manufacturing industry, divide average of total inventories of raw material, goods in process, and finished goods into cost of sales.

A **general or financial turnover** of inventories may be figured by dividing average inventories into sales. Over a period of time such statistics show trends about as well as more accurate turnover figures. This method is useful to measure turnover from brief financial statistics, but if all statistics are available, turnover should be figured in detail and be applied to specific departments to determine what particular part of the business or stocks of goods are not showing proper turnover. This provides better information for supervision and action.

Turnover of **inventories of supplies** should be figured by dividing average inventory of supplies into supply cost or expense for year. Turnover of **inventories of storerooms** is found by dividing storeroom inventory into issues or credits to such storeroom stocks for a period.

Where, as in some classes of business, **quantities** are accounted for, as pounds, barrels, tons, gallons, etc., turnover may be on a unit basis instead of in values.

TURNOVER ANALYSIS.—The following is also adapted from material supplied by Bliss:

The measure for turnover of stocks should be applied to **different classes of stocks,** such as finished goods, work in process, raw materials, supplies, etc., also to stocks carried by individual departments, plants, branches, etc., in order to determine that no channels are obstructed. The more detailed the computation of turnovers, the more effectively are sore places which tie up capital pointed out. As a rule, **turnover should be figured as a relation of average inventory to cost of sales.** Each line of business has its own turnover standards. Competition to a large degree determines turnover in any line. To realize average results on investment, a business should realize average turnovers. Rapidity of turnover has a definite bearing on the margin on sales which must be earned to cover costs of doing business and yield adequate return on capital.

Few organizations appreciate the cost to carry stocks, and fail to figure the advantages of a more rapid turnover or the disadvantages of a slow one. Each line of business has a **normal period** of turnover. Advantages of a rapid turnover are illustrated as follows:

A concern carries an inventory of................	$100,000
It has a net worth of..........................	$150,000
Its average turnover is........................	3 times per yr.
Its average turnover should be..................	4 " " "
If turnover were increased to 4 times per year on same volume, amount of invested capital would be cut by ¼ or..........................	$25,000
Saving on interest cost on this item is............	8%
which is 1.33% on stockholders' investment, as **added net profits.**	

This leaves out of consideration certain additional advantages: smaller liabilities, less spoilage and obsolescence, less insurance, space rentals, taxes, etc.

The following table from Bliss shows **average turnovers** realized by representative corporations in various industries, and shows tendency toward slower turnovers in depression years, 1920 and 1921:

Average Turnover of Inventories of Representative Corporations in Various Industries.[4]

	95 Cos. 1916–1921	57 Cos. 1914–1921
1914	$....	$4.43
1915	....	4.64
1916	4.78	5.08
1917	4.47	4.73
1918	4.47	4.74
1919	4.09	4.25
1920	3.77	3.96
1921	3.52	3.59
Average for full period	$4.21	$4.42

Wide variation in turnover between different industries is shown in following comparison:

Most Rapid Turnovers:		
Slaughtering and meat-packing	$7.48	sales yearly per $1 of inv.
Retail chain stores	5.93	" " " " " "
Chemical products manufacturing	5.42	" " " " " "
Iron and steel manufacturing	5.02	" " " " " "
Slow Turnovers:		
Leather products manufacturing	1.55	" " " " " "
Tobacco products	1.77	" " " " " "
Machinery manufacturing	2.16	" " " " " "
Rubber and tire manufacturing	2.79	" " " " "

Bases of Inventory Valuation

THE ACCEPTED RULE.—The accepted axiom of accounting and business practice is to value inventories at "cost or market, whichever is lower." Certain variations from it are desirable under abnormal conditions, such, for example, from 1916 to 1921, inclusive. At the end of the year 1919, many concerns disregarded the rule "cost or market, whichever is lower," and used still lower prices, basing their action on the belief that the long period of inflation was near its close. This proved true. Prices reached their highest point in May, 1920. At the close of the year 1920, there was a tendency to ignore again the customary rule and to value inventories at cost or market, whichever was higher, and other variations were frequent.

Generally, where there are no substantial changes in cost and selling prices, cost is proper basis of inventory valuation. Under such conditions income accounts are not affected by quantity of unsold goods as shown in the inventory, and the balance sheet shows current values. When there are substantial variations in prices, valuation of inventories at cost may lead to the misstatement of the income of any two given periods affected by such valuation. Under such conditions balance sheets become misleading, failing to reflect current values.

If inventories are reduced to a market basis, they should be reduced to such a figure that as they are carried forward into the subsequent period and sold, a normal gross margin of profit will be realized. If a loss is known to exist in an inventory, it is usually desirable to take it. Carrying stocks into a subsequent period at such a price that when sold they will not yield a normal gross margin sufficient to cover expenses and realize a return on the investment, is carrying forward a loss.

[4] Expressed in yearly sales per $1 of inventory.

In manufacturing operations difficulties frequently arise in the application of the customary rule.

Reduction of the inventory may be accomplished in either of two ways:

1. **Actual inventory prices** on all items may be reduced, these reduced figures thereafter being regarded as the cost.
2. A **general or inventory reserve** may be created, setting up the amount of the shrinkage in a general account, which is deducted from the inventory account in the balance sheet. The inventory sheets stand at cost values. Cost of figuring subsequent periods will be based on actual cost, not upon reduced or market values.

Choice of method requires careful consideration. To adjust by setting up a reserve requires only the pricing of the inventory on two bases: actual cost and reduced or market basis. The difference in total between the cost and market basis is the amount of shrinkage to be cared for by the reserve. When this method is used and individual costs of materials remain unchanged, the cost of figuring the subsequent period is based upon actual cost of material and may be so out of line with existing market conditions as to be misleading rather than advantageous.

If costs on the basis of reduced inventory valuations are advisable, it is necessary to reduce actual cost of materials throughout all detailed records, to refigure costs of work in process and finished goods, and to compute all costs in the subsequent period on the basis of the new inventory valuations. The latter procedure involves much detailed work. Yet the point is worth consideration because it means the difference between cost on an actual cost basis and cost on a reduced or market basis for use by executives in handling business in subsequent periods.

If a **general inventory reserve** is set up the difference between cost and present valuation should be taken care of by means of a journal entry charging Surplus and crediting Inventory Reserve for the difference. Thus, if original cost as shown by inventory sheets is $125,000, the following entry is necessary:

Surplus....................................	$25,000	
Reserve for Decline in Inventory Values......		$25,000

In the balance sheet this reserve is preferably shown on the credit side, but conditions may make it desirable to deduct it from the inventory before latter is brought on the balance sheet. When in the following period, the goods to which this inventory applies are sold, Reserve for Decline in Inventory Values should be closed into Surplus.[5]

INVENTORY RESERVE ILLUSTRATED.—Establishment of inventory reserve is illustrated by the procedure followed by U. S. Steel Corp. Acting upon the changing status of price levels, this company, at the close of the year 1916, set up an inventory reserve of $13,524,794 against an inventory which, taken at cost or market, amounted to $195,425,798. The reserve represented the excess of cost or market above normal prices. At the end of 1917, this reserve was increased to $30,270,670 against an inventory valuation of $253,938,756. At the end of 1919, it stood at $90,000,000 against an inventory of $316,796,678. At the end of 1920, it stood at $95,000,-000 against an inventory of $353,363,497. At the end of 1921, it stood at $60,710,255 against an inventory of $302,214,624. In the balance sheet

[5] For further discussion see article by R. E. Booth in *Administration*, July, 1921, pp. 96–97.

of U. S. Steel Corp. as at Dec. 31, 1921, the item of inventories is expressed as follows under general head of "Current Assets."

> Inventories, less credit for Reserve and for amount of inventory values representing Profits earned by subsidiary companies on Intercompany sales of products on hand in Inventories December 31, 1921 .... $241,504,369.79

The U. S. Steel Corp. inventories, before allowing for reserve described above, were determined on the basis of actual purchase or production cost of materials to the respective subsidiary companies holding them (unless such cost was above the market value on Dec. 31, 1921, in which case the market price was used), except that in respect of such commodities in stock at the close of the year as had been purchased by one subsidiary company from another, there is excluded the approximate amount of profits in such sales price which had accrued to the subsidiaries selling the same or furnishing service in connection therewith.

In connection with a **reserve for depreciation of merchandise inventories,** the following three points should be kept in mind:

1. **The reserve should not be cumulative,** as is the case with reserves for depreciation of fixed assets. A reserve set up against an inventory applies to that inventory only and should be dropped when a new inventory is taken. If the inventory at Dec. 31, 1921, is $100,000, a 5% reserve against this inventory has a credit of $5,000. If at Dec. 31, 1922, the inventory is only $80,000, the reserve should be $4,000. If at Dec. 31, 1923, the inventory is $120,000, the reserve should be increased to $6,000. The reserve thus always stands at 5% of the inventory when the books are closed.

2. **The reserve should be set up by a charge to Surplus,** not to Profit and Loss. If the inventory is priced at cost or market, whichever is lower, and if accrued deterioration is allowed for in valuing the goods, all elements affecting the current operations of the period will thereby have been taken into consideration.

3. **On the balance sheet,** the reserve should be so placed as to be easily recognized as an appropriation of surplus as a conservative provision for losses which may possibly occur, instead of as a deduction from an asset on account of losses which have already taken place. Special conditions, however, may make it desirable to show the inventory net, thus avoiding disclosure of the amount of the reserve on the balance sheet. Since the war conditions were abnormal the declining inventory values of that period were a proper charge to Profit and Loss rather than to Surplus.

In addition to reserve for reduction in inventory valuations, **inventory reserves** may be set up for:

1. Provision for discounts in inventories.
2. Provision for interdepartmental profits in inventories.
3. Provision for intercompany profits in inventories.
4. Provision for interest in inventories.
5. Other inventory adjustments.

In the balance sheet these reserves ordinarily should be shown as deductions from asset accounts, since they represent working capital adjustments. An alternative plan is to reduce actual items in the inventory; and this is sometimes necessitated by operating conditions.

COST BASIS.—Under this basis certain considerations arise. If by cost is meant actual cost, certain difficulties of a technical nature must be overcome. Unless all stock on hand was acquired at a single cost price—a con-

dition not likely to exist—actual cost of the goods at the end of any given accounting period can be ascertained only when it is possible to identify each item of stock in terms of lots purchased; in other words, to make this plan successful it is necessary to devise a system of marking whereby each item in the inventory can be identified. In many cases this is impracticable. Usually "cost" is an estimate which may involve serious error. One expedient is to take the **arithmetic average** of invoice prices. This may be worked out by making use of the prices of all lots purchased during the current period and also including the price used in valuing the last preceding inventory. Sometimes the average is computed only from purchase prices for the period. Sometimes the prices of representative lots are averaged. Such computations are based upon the assumption that all lots purchased are equal in amount—which is likely to be a serious error.

This error may be overcome by employing a **weighted average** of prices, thus giving influence to the various sizes of lots purchased. The initial inventory and total purchases, with respect to both quantity and value, should be taken into consideration. This plan is based upon the assumption that the goods sold are taken from the lots purchased in proportion to the original amounts of these lots. In fact, this assumption is almost invariably untrue, because goods are not sold in proportion to the quantities in the various lots purchased.[6]

When it is not necessary to determine **literal cost** it is possible to follow a plan based upon the assumption that the goods sold are taken from the oldest in stock and therefore the goods on hand are the most recently purchased. This plan may be carried out by arranging the invoices in chronological sequence and, beginning with the most recent, taking off figures for both quantity and value until a quantity total is secured which is equivalent to the physical inventory—the corresponding value total then gives the value inventory.

Although the above scheme will not usually correspond with the actual facts, it has received the sanction of the Treasury Department and has some justification from the economic side. It is only relatively recent prices that are of interest to the management, and these are the ones employed under this plan. The following advantages are cited in its favor:

1. It exhibits **cost.**
2. The inventory value is drawn from the **actual records** in a simple yet systematic way.
3. It conforms to sound business principles.
4. It is based on a reasonable assumption regarding the movement of goods.

When to Use Cost Basis.—Most inventories taken on a cost basis represent cost only in a nominal sense, because the true cost of each unit is often difficult or impossible to secure. The various devices which may be used almost invariably give different results.

There is one condition under which cost is indubitably the correct basis of inventory valuation even though market may be lower. This is when selling price is not affected by a drop in the market. Thus, an inventory of raw material used in a printing plant should be taken at cost because selling prices of output are based on cost, and are not affected by the market prices of raw materials.

---

[6] W. A. Paton, Inventory Valuation, *Administration*, Mar., 1922, pp 291–302.

There are two conditions under which it is proper to value inventories at cost even though cost is higher than market, viz., when:

1. **Basic or staple commodities** are temporarily quoted at less than normal production cost.

2. **Raw materials** or other **commodities** have been purchased at prices higher than those existing at the closing date, and such purchases are allocated to contracts not subject to cancellation, the contract price being based on the high cost of such raw materials.

MARKET BASIS.—The chief advantage of market price—or, as it is sometimes termed, **replacement cost**—in inventory valuation, is its simplicity and ease of application. The value of the inventory is secured by multiplying the physical units in the inventory by the latest reliable market quotations. This method does not ordinarily give results widely different from those secured by using the cost basis figured on the most recent acquisitions up to the amount of the inventory. An investigation carried out by the Bureau of Internal Revenue in 1919 disclosed the fact that in certain lines of manufacture this plan of inventory valuation is much favored.

"COST OR MARKET, WHICHEVER IS LOWER" BASIS.—This is a combination of the two described above. It has been adopted by the Bureau of Internal Revenue as one of the two alternatives—the other being cost—and was recommended by a committee of accountants which reported to the British Board of Trade in 1917. It is favored by many professional accountants.

This method introduces a double standard of valuation, and in taking an inventory on this basis it is necessary to provide three columns. In column 1, market prices are placed. In column 2, cost prices are placed, and in column 3 the lower of the two figures, cost and market, are placed for each item. It is, of course, permissible to price by groups.

For the manner of determining cost under this plan, see above discussion, and Regulations 62, issued by the Treasury Department.

The **method of determining market value,** as prescribed by Regulations 62, is analyzed as follows:

1. Market means current bid price prevailing at date of inventory for the given merchandise in the volume in which it is ordinarily bought by the taxpayer.

2. When open market quotations are not available, the taxpayer must use such evidence of fair market price at date or dates nearest the inventory as are available. These might be specific transactions in reasonable volume entered into in good faith, or compensation paid for cancellation of contracts for purchase commitments.

3. Where, because conditions are abnormal, the taxpayer has regularly sold such merchandise at prices below the current bid price as above defined, the inventory may be valued at such prices and the correctness of such prices will be determined by reference to the actual sales of the taxpayer for a reasonable period before and after inventory date. Prices which vary materially from actual prices thus determined are not accepted as determining the market.

4. Goods in process of manufacture may be valued for purposes of the inventory on the **lowest** of the following bases:

(a) Replacement cost prevailing at end of fiscal year.
(b) Reproduction cost prevailing at end of fiscal year.
(c) Proper proportionate part of actual finished cost.

(d) Under abnormal conditions, the proper proportionate part of sales price of finished product.

Account should, of course, be taken in all cases of the proportionate part of the total cost of basic elements (materials, labor, and indirect) represented in goods in process of manufacture in the stages in which they are found as at the end of the fiscal year.

The definitions, 1, 2, 3, and 4 above, given for determining market value, apply to the following:

1. Materials and supplies purchased and on hand as at the end of the fiscal year, in the same condition as when purchased.
2. Goods in the process of manufacture as at the end of the fiscal year.
3. Finished goods on hand as at the end of fiscal year.

According to Article 1584 of Regulations 62, column 2 of the inventory—market price—may be subdivided into four columns in order to ascertain which is the true or lowest market, as follows:

1. Replacement cost.
2. Reproduction cost.
3. Proportionate part of acutal finished cost.
4. Proportionate part of sales price of finished product.

The chief difficulty in the application of these principles arises not in the figuring of market for materials or goods or supplies purchased by the taxpayer, but in figuring market for goods in process of manufacture and of finished goods. As they apply to these, the provisions of Article 1584 are as follows:

(a) Those **not contracted** to be delivered **on firm sales contract** at fixed prices entered into prior to the end of the fiscal year, may be figured at the lowest of:

1. Replacement cost.
2. Reproduction cost.
3. Proportionate part of actual finished cost.
4. Under abnormal conditions the proportionate part of sales price of finished product.

(b) Those **contracted** to be delivered **on firm sales contract** at fixed prices entered into prior to the end of the fiscal year may be figured at the lowest of:

1. Replacement cost.
2. Proportionate part of actual finished cost.
3. Under abnormal conditions the proportionate part of sales price of finished product.

SELLING PRICE BASIS.—Selling prices are used in two ways in inventory valuation. Current selling prices may be taken as a starting point from which, by working backwards and making certain deductions, a figure is secured which is a kind of cost figure. In T. D. 3058 the Treasury Department authorizes retail dry goods dealers to take inventory by the "retail price" method. This plan consists in the computation of the cost of stock by deducting a "purchase mark-up" percentage from the estimated selling value of goods on hand. A manufacturer of pharmaceutical supplies values his inventory by means of a formula designed to reduce selling value by estimated costs plus estimated profit.

The **alternative use** of selling price in inventory valuations is its direct application to the physical inventory to secure its value. Accountants object to this method because it anticipates profit. There are, however,

certain instances in which selling price may be employed, as, for example, where finished goods are made to order on a binding contract, and, perhaps, where the fabrication process is very long. The Treasury has permitted farmers to value unsold produce at sales price less marketing costs. Again, selling price may be taken as a basis if it requires no great effort or if the sale is a foregone conclusion. Whether or not such a condition exists or can exist must be determined upon the facts. The impossibility of determining cost may also justify the use of selling price or some figure based on it.

As a general rule, selling values must be rejected as a basis for inventory valuation, because ordinarily a profit can be made only when a sale is consummated. Moreover, selling prices may decline greatly between the date of taking the inventory and the date of sale, so that there is no logic in the use of the selling price as at the inventory date except under the special conditions mentioned above.

BASE STOCK BASIS.—Some manufacturers carry basic raw materials through the accounts at fixed and perhaps arbitrary prices. This plan has simplicity in its favor, but it is subject to criticism for the reason that balance sheets based on such valuations are misleading. Some concerns which adopted the plan at the beginning of the World War have concluded that their procedure was justified by the results.

INVENTORIES BASED ON SELLING VALUATIONS—GROSS PROFIT TEST.—Department stores and certain other lines of trade follow the practice of taking inventories at selling prices and then deducting from the aggregate a certain percentage in order to arrive at an estimate suitable for balance sheet purposes. This method is illustrated as follows:

Sales	$292,000
Closing inventory (selling valuation)	50,000
	$342,000
Less: Opening inventory (selling valuation)	37,000
Selling valuation of purchases	$305,000
Less: Purchases at cost	227,469
Mark-up (25.42% of $305,000)	$ 77,531
Closing inventory (selling valuation)	$ 50,000
Less: Mark-up (25.42% of $50,000)	12,710
Closing inventory (balance sheet value)	$ 37,290

The process may also be expressed in the form of a proportion, as follows:

305,000	:	227,469	::	50,000	:	X
Selling valuation of purchases.		Purchases at cost		Closing inventory at selling valuation.		Closing inventory at cost valuation.

$$X = \$37,290$$

The following description of the "gross profit test" appeared in the *Journal of Accountancy*, Mar., 1921 (p. 225):

Stock on hand may be estimated at dates between the taking of physical inventories by applying the gross profit method. The rate of gross profit on sales since the last inven-

tory may be estimated on the basis of the rate of gross profit earned on sales in prior periods. Any changes during the period in the cost or selling price of merchandise would have to be taken into consideration in estimating any probable variation between the rate earned in prior periods and the rate earned in the current period. The sales since the date of the last inventory would be multiplied by this estimated rate of gross profit to determine the estimated gross profit on the goods sold. Then the sales minus this estimated gross profit would be the estimated cost of goods sold since the last inventory. The opening inventory plus the purchases, freight, and other additions to the cost of goods, minus the estimated cost of goods sold, would give the estimated inventory.

The **retail inventory system** is described as follows by T. L. Blanke, Director of the Bureau of Accounting and Control of the National Retail Dry Goods Association:

The system enables the merchant to know what his stock of goods on hand is at the close of each day, week, month or year, or any other period, for each department in the store, and he thereby is able to control his investment. An efficient control of the stock not only saves money on the money invested, but, what is of much greater financial importance, helps in the avoidance of depreciation of goods on hand and in maintaining up-to-date merchandise.

Under this system of inventory accounting, the merchandise is charged to the various departments on the books of account at the retail or selling price and also at cost. These cost and retail values are accumulated for the year by periods and the percentage of mark-up is arrived at by deducting the total cost from the total retail values and dividing the result by the accumulated retail figures. The retail value of the inventory at the close of any period is arrived at by deducting the sales and mark-downs taken on the original selling price from the accumulated retail values. The cost value of the goods on hand is then computed by subtracting from 100%, the percentage of purchase mark-up, the remainder being the percentage of cost. Multiplying the retail value of goods on hand by this latter percentage gives the value of the inventory at cost. **Physical inventories** are taken at the close of the year at the retail values and the book figures are adjusted to them.

The **percentage of mark-up** on merchandise must be sufficient to cover the cost of salaries and other operating and administrative expenses, receiving and delivery costs, mark-downs, inventory losses of all kinds and a net profit for the business. That a net profit is not always realized is shown by the fact that the average net profit for all stores reporting in 1921 was less than one cent for each dollar's worth of sales.

The system is very easily installed and operated, and it has been found entirely practical for the small as well as the large stores. It has been approved by the Treasury Department, through the Bureau of Internal Revenue, and is being installed by all the leading public accountants of the country. There is no question that the system actually saves the retailer many thousands of dollars annually. The president of one of the largest metropolitan stores recently said that it would increase his operating expenses fully $600,000 a year to go back to the "cost" system of taking inventory, while a somewhat smaller merchant stated that the use of the "cost" system would increase his expenses more than $200,000. It is therefore as important to the consumer that the retailer should be efficient in his accounting methods as it is to the retailer himself.

What are the **advantages** of this system that enable the merchant to make this saving? In the first place, it furnishes a definite and reliable basis for the taking and valuing of stock for financial statement purposes. This is of vital importance to the banker and broker when passing upon the financial statement of a client. It is, therefore, of direct benefit to the retailer himself in that it establishes greater confidence in his financial ability, making borrowing easier and on more liberal terms.

The inventory system is accurate in the results that it shows. The Internal Revenue Bureau has accepted it because of the fact that the book figures are accurate and easily verified. The complete records of every step from the purchase of items to their final disposition by sale are readily checked. It is almost impossible to do this under the cost system. The natural result is that those who use the retail inventory method have substantiating evidence of their actions, while those without it may be subject to some adjustments by tax officials, which may be felt to be unjust, but, from lack of evidence, they will probably suffer.

Furthermore, the fact that accurate inventory values are available at all times makes the system particularly valuable from an **insurance standpoint**. The records will show at

any time just what the amount of stock is in each department, so that a store can carry sufficient insurance, but will not carry excess amounts, thus incurring unnecessary expense.

In addition, this method provides **an efficient check** in dollars and cents as between book and physical inventories at retail, **without the use of percentages.** If large differences are found to exist between the two, the work can be rechecked and errors corrected. It will disclose inventory padding on the part of those handling the stock. If a buyer should report an inventory at retail higher than the book inventory, it would be sufficient grounds for believing that he was attempting to increase profits by inflating the stock. This is especially true where the buyer is receiving a bonus based upon earnings.

Through its use **merchandise stocks may be controlled.** Unless the merchandise manager knows at least once a week the amount of stock in each department, the size of the inventory or the stock turnover cannot be controlled. Time is saved at the close of the fiscal period or at any time when the physical inventory is taken. With this system in operation, it is necessary to take the inventory at retail only, thus eliminating the chances of errors through the copying and decoding of cost marks. . . . Not the least of its advantages is that it provides for a complete monthly operating statement, making it possible to issue an accurate profit and loss statement for the business as a whole, as well as for each individual department. The figures affecting the gross profit being available at all times, unnecessary waste can be prevented through the elimination of losses that would not otherwise be discovered until the close of the year.

Miscellaneous Provisions

INVENTORIES PLEDGED AS COLLATERAL.—When merchandise is pledged as collateral, it is important that the amount so pledged be set up as a separate item in the balance sheet, or that some kind of reference be made to it. Likewise, the liability incurred to creditors who have advanced money on such security should be shown separately, and a contra reference made to the pledged merchandise shown on the asset side of the balance sheet.

PROFITS IN INVENTORIES OF AFFILIATED COMPANIES.—Where one affiliated company sells goods to another affiliated company at an advance over cost, there results an increase in the value of inventories due to the taking of a profit on intercompany sales. It has been said that inventories of affiliated companies should be expressed at cost,[7] even though in such cost there is an element of intercompany profit, but it is now the definitely settled practice of accountants to reduce inventories by the amount of profits earned by affiliated companies on intercompany sales of products included in the closing inventory. These profits are not carried into currently reported earnings of the consolidated organization until converted into cash or a cash asset to the company. The following note appears immediately below the surplus division of the balance sheet of the U. S. Steel Corp.:

> That part of the Surplus of Subsidiary Companies representing Profits accrued on sales of materials and products to other subsidiary companies and on hand in latter's Inventories is, in this Balance Sheet, deducted from the amount of Inventories included under Current Assets.

If it is not possible to ascertain actual figures of intercompany profits in inventories, an estimated reserve should be set up to exclude approximate amount of profits resulting from intercompany sales.

In some cases it may be inappropriate to assume average profits in such inventories. Under these circumstances, if inventories are valued conservatively, there can be no objection to permitting such element of profit to remain in the inventories.

---

[7] *Journal of Accountancy*, Dec., 1915, pp. 470–471.

FREIGHT-IN AND STORAGE.—Freight-in and the expense of unloading are properly regarded as parts of inventory cost. As to the expense of storage there may be some question. If raw material is kept any length of time to permit curing, costs of storing are proper additions to inventory values. If, however, the material or finished goods are placed in storage merely to wait until used or sold and no increase in value results, it is better not to add storage charges to cost of goods. Storage expenses of this kind are rather in the nature of rental costs, and there is no reason for believing that the storage expenses incurred have raised the value of the inventory.

Raw materials inventories are ordinarily taken at cost or market, whichever is lower. Cost should cover invoice price plus freight, duty, insurance, storage, handling, cartage, etc. Market basis is replacement cost based on present purchasing prices. Adjustment required is found by figuring both actual and replacement cost of materials. In case of declines in values, adjust either by a general reserve or by adjusting actual cost figures. The method used has a bearing on costs to be computed on products to be finished in subsequent periods.

INVENTORIES OF MANUFACTURING CONCERNS.—Inventories of manufacturers differ from those engaged in trade, because materials purchased are made to undergo significant alterations in the process of manufacture and take on added increments of value as the result of labor and overhead costs applicable to them. Inventories are, therefore, found in the following three stages:

1. Raw Materials
2. Goods in Process
3. Finished Goods

Finished goods stand in the same relation to the manufacturer as does merchandise to the trader. The elements of cost accumulated by materials as they pass from the raw materials to the finished goods status may be outlined as follows:

1. Raw Material Stage:
   (a) Purchase cost of materials and supplies.
   (b) Freight and cartage inward.
   (c) Cost of handling and storing.
2. Goods in Process Stage:
   (a) Cost of raw materials taken from stores.
   (b) Productive labor cost, which must be allocated to the product on some adequate basis.
   (c) Manufacturing burden, also known as overhead, oncost, and indirect expense. Since this item cannot be allocated to any given unit produced, it must be allocated on some scientific basis.
3. Finished Goods Stage:
   Goods finished are credited to the Goods in Process account and charged to Finished Goods account, which latter corresponds to the ordinary Merchandise account of a trading concern.

INVENTORIES OF GOODS IN PROCESS.—The inventory value of goods in process can be secured by a recapitulation of the cost sheets, provided all elements of cost, materials, labor, and indirect have been brought upon the cost records. It is sometimes customary to apply the indirect to finished goods only; when this is the case the inventory-pricing must be done with

reference to the burden which is applicable to goods in process, or else a special account should be set up for the purpose of containing this unapplied burden. It can then be shown as a deferred charge to cost of manufacture.

DIVISION OF WORK IN PROCESS.—For analytical purposes it is sometimes desirable to make a division of work in process into three parts: **Material in Process, Direct Labor in Process,** and **Burden in Process.** In large plants separate accounts may be kept for each department. When this is done, special attention should be given to **Burden in Process.** Frequently predetermined rates are used, it being presumed that burden in process will equal actual burden. The advantage of this is that it makes possible the compilation of costs in advance of the time when actual burden is known. For each department two burden accounts are kept: **Burden Actual** and **Burden Credit.** To the first, all burden is charged as it accumulates. To the second is credited estimated burden as it is distributed to work in process. A comparison should be made of the two accounts to determine whether the estimated or predetermined rate is large enough to cover actual burden costs.

If desirable to write down inventory of work in process, the costs of material, labor, and overhead should be refigured to determine wherein the change occurs.

INVENTORIES OF FINISHED GOODS.—This is secured by a recapitulation of the cost sheets which refer to job or stock numbers which have not been sold. Goods which are shopworn or out of style should be valued at a price not greater than they can be expected to realize on sale, which, of course, may be much below cost. Finished goods should be valued at cost except in case of firm orders based on contract, in which case it may be feasible to use selling prices less estimated delivery and similar charges. It is better not to regard a sale as completed until delivery has been made and the goods accepted by the vendee. If it is thought best to take the inventory at selling price, the unrealized profit resulting should not be included in current income but be shown separately.

It is possible that to include finished goods in the inventory at cost would be to value them above selling price. This might be the case where a business is being run on an extravagant basis and costs are excessive. In such instances market price should be made the basis of valuation.

When reducing such inventories to a market basis, either use a reserve or write down the actual cost figures. If costs have a bearing on selling policies and prices, it is advisable to write down actual inventory prices, so that statistics of a subsequent period will be based upon the reduced costs.

If by such market basis is meant present replacement, figure costs on basis of present market for material, supplies, labor overhead, etc. Naturally, greater change may occur in one of these elements than in another.

INVENTORIES OF SCRAP MATERIALS.—Market is the usual basis, allowance being made for selling and marketing costs yet to be incurred. Scrap or by-product remains part of prime operations until it is processed into its first marketable stage. Profit realized up to that point belongs to the major operation. In figuring cost of major product, figure value allowed for scrap on by-product backwards from value of by-product in its first marketable stage, by deducting expenses necessary to put it in marketable form and to dispose of it. After such products reach their first marketable stage, any operations preformed are allied industries, and profits realized thereafter should be considered as earnings of such allied industries. These allied industries should be charged with by-products from major operations

at full market value. Therefore, the rule should be to inventory scrap or by-products at market until transferred to the allied industry. Thereafter inventory should be on basis applicable to operations of the allied industry.

INVENTORIES OF SUPPLIES AND REPAIR MATERIALS.—Value of these is cost or market, whichever is lower. If market is lower and a reserve is used, the reserve to be set up is the difference between cost and market. Reserve should or should not be used according as operations are or are not departmentized, because in former case it is not important that supplies be figured into cost at the reduced value, whereas in the latter case it is, since departments are run on a commercial basis.

INVENTORIES OF RETURNABLE CONTAINERS.—Illustrations are cement sacks, barrels, cable reels, acid carboys, gasoline drums, cracker tins, petroleum drums, tierces, etc. Sometimes these are charged to customers in the invoice and a refund made when returned. Sometimes a separate invoice is sent for them, credit being allowed upon their return. Sometimes merely a memorandum invoice is made out. Oil drums, cable reels, gasoline drums, and floating cooperage should be regarded as fixed assets, and an asset record kept therefor. Charge these at cost and write off depreciation in the usual way. If these are actually charged to customers, credit a reserve which will take care of refunds when they are returned. Periodical examination and adjustment of the account should be made.

Smaller items should be carried as current supplies. If a definite charge therefor is made against the customer, do not include the item in sales but credit a reserve to care for refunds when such retainers are returned.

GOODS OUT ON CONSIGNMENT.—These may be billed at cost, market, or an arbitrary price. They are not sales. If billed at a price above cost, profit is taken before it is realized. In the commercial fertilizer business the product is billed at market price to agents or brokers. At the season's close the accounts are checked up and unsold product ascertained. The account sales at closing date should be secured and the accounts adjusted, the anticipated profit being cared for by a general reserve.

GOODS HELD ON CONSIGNMENT.—The following is quoted from J. H. Bliss:

> An income statement combining the regular business and the consigned business gives a complete picture of the transactions of the period and affords the basis for computing volume and expense ratios. There should be no objections, in such circumstances, to including in inventory of consigned goods billed prices, stating them to be such and showing on the other hand the amounts due to consignor among the accounts payable. In a broader sense, this is the proper method for handling such accounts if the balance sheet is to present a picture of the complete financial structure of the business. The inventory of goods on hand for sale represents capital used in the business, whether they are owned by that business or are there on consignment.
>
> ..The turnover of the business and the relation of the volume of business done to the fixed investment, and the relation of the sales to the accounts receivable, all require consideration of the consignment business, the same as the regular business, if these fundamental relationships are to be correctly expressed. Goods received on consignment are really a source of capital, in that the consignor supplies the investment on which the business is done. In order to get a complete picture of the financial status, such consignments should be taken into consideration.
>
> In some instances materials are consigned for manufacture on a commission basis. Here it seems even more important that such consignments should be taken into the accounts at billed prices and handled from there on in the same manner as owned goods, though of course kept separate. In the figuring of factory costs,.the application of overhead expenses, and measuring of the efficiency of manufacturing operations, it is necessary that these con-

signed stocks be accounted for similar to the owned stocks. Inventories of such stock in process of manufacture or completed should be valued on a basis of the billed price in, plus the manufacturing expenses incurred, except where such expenses exceed the amount of commission and a loss is apparent. In that event, the loss should be taken in a current period rather than carried forward.

The accepted method is as follows: Goods on consignment should be included in the inventory of the consignor, who retains legal title to them until sold by consignee. It may be necessary to include goods owned but not yet received. Goods received on consignment should be excluded from inventory of consignee. Goods not yet unloaded from cars, and therefore not taken into stock, must be so marked that they will not be charged into the next period's purchases and at the same time taken into the current inventory. This may be done by stamping the invoices: "Included in the 19— Inventory."

INVENTORY VALUATION IN DIFFERENT TYPES OF MANUFACTURE.—Three types affecting cost figuring are:

1. Ordinary manufacturing operations.
2. Producing major productions and by-products.
3. Producing joint products.

Ordinary operations consist in putting together or building up materials, labor, and expenses into finished product. It is the common type of manufacturing operation.

Producing major products and by-products involves taking apart or breaking down of some material of known cost into parts, one being a major product, the others by-products. The major product is figured thus:

1. Beginning with known cost of material.
2. Add costs and expenses incurred in operations.
3. Making total outlay for materials and expenses.
4. Deduct therefrom full value of by-products produced.
5. Balance is cost of major product.

Ordinary rule, cost or market, whichever is lower, applies to major products, but only available basis for by-products is market. Their cost cannot be figured because they are joint products arising out of same operations that produce the major product and must be valued on a market basis in arriving at cost of major product.

If such by-products can be identified in processes following the prime operations, they may be valued at original value placed upon them when costs were figured. But if such products are not identifiable in the subsequent processes, only basis of valuation is current market price. Inventory prices for such by-products should allow for selling and marketing expenses, but no allowance should be made for estimated profit on sale of such if full values have been used to figure costs. Effect of using full value to figure cost is to throw profit or loss on entire transaction into major product accounts.

In manufacturing joint products, materials of known cost are taken apart, broken down, but none can be termed a major product. It is then impossible to figure the products singly although the group cost can be ascertained. Cost computing under these conditions is done as follows:

1. Start with known cost of raw material.
2. Add expenses and costs incurred in operations.
3. Making total outlay.
4. Figure total value of all products produced.

5. Compare this with total outlay figured above.
6. Difference is margin of profit or loss realized on operations.

Inventories of such products must be valued on a market basis. The products may be carried at the original valuation in subsequent inventories if they retain their identity; if they do not, current market must be the basis used. It is then advisable to allow for selling and marketing expenses yet to be incurred, and if the items do not lose their identity in subsequent operations or processes, it may be possible to allow for unrealized profit.

DISCOUNTS ON PURCHASES IN INVENTORIES.—Always take **trade discounts** off in pricing inventories. In case of strictly **cash discounts,** it is customary to regard them as financial gains, hence the invoice price should be used. Where, as in case of the clothing and shoe business, discounts run as high as 5% to 10% 10 days, net 30 days, it may be desirable to make deduction for them. When it is found desirable to make an allowance, it is best to set up a reserve. The amount to be allowed is found by applying to the inventories the average rate of discounts realized. Charge a **Discounts Earned account** and credit a **reserve.** At beginning of following period reverse the reserve.

INTERDEPARTMENTAL PROFITS IN INVENTORIES.—These represent unrealized profit and should be eliminated. If transfer is made below cost, an interdepartmental loss occurs, but these arise only when departments are run on a commercial basis, the transfer being at market price. The loss is then taken care of automatically. For interdepartmental profits a reserve should be set up at inventory dates. If, in case of manufacturing concerns, it is not possible to identify products as they pass through the various processes, the profit must be estimated on basis of average margin of profit realized. In case of joint products, inventory basis is usually market price, hence contains a profit or loss. It is impossible to determine the interdepartmental profit in such cases. It is proper to use conservative market prices in such cases.

INVENTORIES OF FIXED ASSETS.—The valuation of fixed assets is based upon different principles from the valuation of merchandise inventories. Here the principle of going concern value is important. Capital is tied up in assets of a permanent character and to dispose of it means the break-up of the enterprise. The market value of such assets as second-hand property could have no influence on a valuation based on going concern values. In general, only two factors need be considered in the problem of the valuation of fixed assets, viz., original cost and depreciation.

GOODS MADE UNDER CONTRACT.—Where goods in process are being manufactured under contract, as in case of extensive construction work, contracts partially completed may properly be given a valuation other than cost. The sale is a foregone conclusion, and it is quite proper that there be included in the inventory the share of profit applicable to work already completed. This plan is especially desirable when the contract is paid for in instalments, the payments being made on the basis of work completed. Thus, some contracts are made on the basis of a fixed price per cubic yard of earth excavated, and so on, a percentage of the total contract price being retained as a guaranty of satisfactory work.

Advances received on contract work are preferably treated as current liabilities, not as deductions from current assets, because if deducted from inventory account, actual amount of capital tied up in goods in process is understated. In this matter, however, it may be desirable to distinguish between advances received on contract work before any of the contract is undertaken,

and those received on contract work where the amount of work performed, plus accrued profit to date, is greater than the amount of the advance.

GOODS HELD IN STORAGE.—Charge costs of carrying against such goods if they enhance their value. Interest may be included if considerable sums are carried for long periods. In preparing a statement of storage operations, interest may be eliminated, as follows:[8]

1. Cost of product in storage.
2. Add expenses:
   Storage charges.
   Handling and delivery.
   Insurance and taxes, etc.
3. Total outlay.
4. Products sold for.
5. Gross earnings after interest charges.
6. Add back book interest charge.
7. Gross earnings before interest charges.
8. Deduct actual interest paid, taxes, and other general expenses.
9. Final results.

Inventories of goods held in storage should be valued at cost plus carrying charges, unless market is lower than cost, in which case the valuation should be made or a reserve set up.

GOODS IN TRANSIT.—Consider goods in transit but not received, and also those received but not passed to stock, as inventories, crediting an **Unaudited Accounts Payable** account. To do this, a suspense entry is necessary. To ascertain goods in transit, use the shipping memos or the invoices of the first weeks of the succeeding period but bearing dates of the preceding period. This sum should be deducted from amount of contracts for purchases outstanding at balance sheet date.

ADVANCE PAYMENTS ON GOODS NOT RECEIVED.—Charge such payments to creditors' accounts in accounts payable ledger. Accumulate such debit items in creditors' accounts and enter in inventory section of balance sheet as advances on purchases not yet received. An alternative plan is to carry a ledger of personal accounts for such advances, charging these accounts as payments are made and crediting them when the invoice is passed. This gives a good control and furnishes a check on the passing of the invoices.

PURCHASE COMMITMENTS.—When contracts are placed, record them as orders outstanding for future delivery, classifying them as to departments or materials, also as to delivery dates. This record is not part of the double-entry system. As goods are received, check them off on this record so that only outstanding commitments can be determined at any time.

Inventory Taking

NEED OF PHYSICAL INVENTORIES.—Physical inventories should be taken to check book inventories, if the latter are kept. If the latter are not kept, physical inventories are essential to the determination of profit and loss. The existence or non-existence of book inventories determines the method to pursue in taking physical inventory. Where adequate stores records exist, the work of taking a physical inventory consists in counting or weighing a

[8] J. H. Bliss.

few items each day and checking them up with the book records. In this way all items may be checked up several times each year. A regular system of checking should be instituted.

It is estimated that when a plant closes one week for taking physical inventory, it loses 2% of its productive capacity.

PROCEDURE IN TAKING PHYSICAL INVENTORY.—Proper preparation for inventory-taking removes many difficulties. The following routine should be followed:

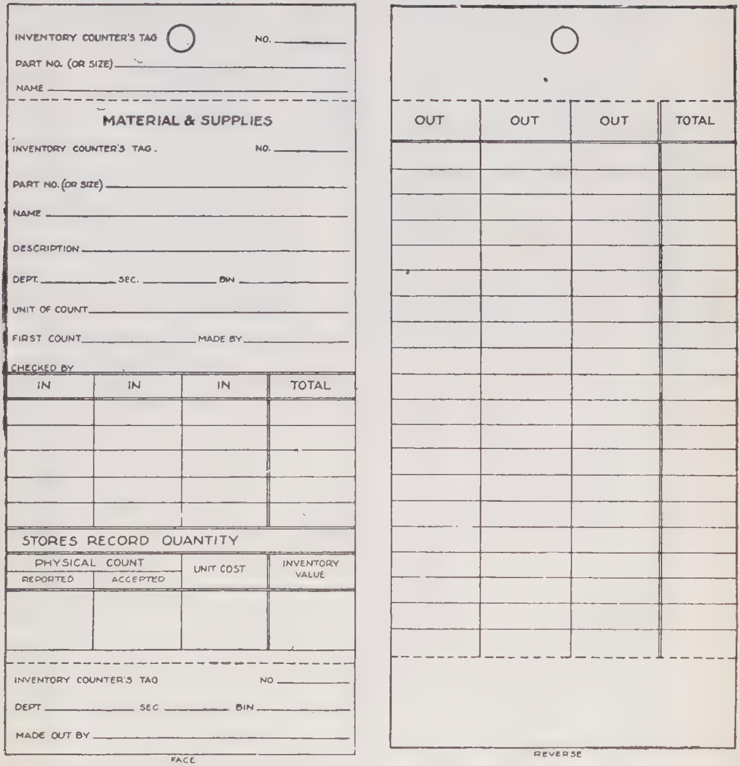
1. Writing and issuing instructions.
2. Making ready the inventory tags.
3. Counting, weighing, and measuring the inventory.
4. Comparing the inventory with the records.
5. Pricing the inventory tags.
6. Extending the inventory tag values.
7. Listing the inventory.
8. Totaling and comparing the inventory with the control accounts.

The instructions, after being clearly worded, should be typewritten or printed. It may be desirable to issue special instructions to each department supplementing the general instructions. The general instructions under (1) above cover such items as: length of inventory period, personnel, items to be inventoried, details of counting.

During time of taking inventory, all operations should cease. Some party should be made entirely responsible for the results secured. All details of procedure should be carefully assigned to the various departments. The **receiving department** should be instructed to clear its floors of all goods up to the "as of" date. Goods received after the "as of" date must not be included in the inventory. The **materials control** department should be instructed to clear up any clerical work connected with requisitions, etc., so that all stock records will be up to date. The **storekeeper** should be instructed to place all stock in orderly arrangement, so as to be ready for counting or measurement. Obsolete material should be discarded. Deliveries on requisition should cease during time of taking the count. The **manufacturing departments** should reduce amount of material on floors to a minimum. All materials entering the **inspection department** before the "as of" date should be forwarded to the stockroom so as to be included in the inventory. The **purchasing department** should reduce the amount of material to be received during period of inventorying as much as possible, also to period preceding, to reduce amount of inventory as much as possible. The **sales department** should supply the accounting department with data as to products billed but not yet shipped, also as to products shipped but not yet billed, to enable proper adjustments to be made. The **accounting department** must calculate all adjustments to be made in the inventory. Frequently this department is given entire supervision over the inventory-taking. If so, it should charge out all tags and inventory sheets as issued and credit them as returned. For this purpose they should be numbered serially. After the tags are priced, they are listed on inventory sheets. The latter are totaled by controls. After adjustments are made, comparison is made of results with general ledger inventory control accounts.

INVENTORY TAG.—Form 12 shows an inventory tag for inventorying materials and supplies. The "in" and "out" columns are for changes in inventory resulting from inward and outward movements when count is made before "as of" date. Tags should be numbered serially. Counts and

measures should be repeated before filling out tags. Note that tag is perforated into three sections. The tags are attached to materials covered by means of wires. Bottom section is torn off and sent to office having supervision. All tags must be accounted for. When all work is completed in a department, main divisions of tags should be torn off, leaving top section



Form 12. Inventory Tag for Raw Material and Supplies (face and reverse)
(From Madison Cartmell's "Stores and Materials Control")

attached to goods. They are sent to supervising officer and compared with duplicates. They are then sorted according to material classifications, and forwarded to materials department for pricing and comparison with stock records. Differences must then be reconciled by recount or adjustment. Pricing is usually at cost or market, whichever is lower. (See "Bases of Inventory Valuations," p. 369). When the price used differs from that used in the stock record, the stock record price should be altered to correspond. Tags are then returned to accounting department for extension, then arranged

FORM 14. "Cost or Market" Inventory Sheet

by material control accounts, and listed on inventory sheets. (See Forms 13 and 14.) Final differences between book and physical inventories should be adjusted through profit and loss. Form 14 is a "cost or market" inventory form recommended to the National Association of Upholstered Furniture Manufacturers by J. L. Maltby. It contains columns for both cost and market prices, and an "inventory value" column to which either the cost or market price may be extended, as well as other columns for entering data necessary in taking an inventory.

Accounting Treatment of Inventories

ACCOUNTS TO BE KEPT.—Certain accounts must be kept in connection with the recording of purchases, sales, and other merchandise transactions. The most important of these are: Purchases, Sales, Returned Purchases, Returned Sales, Rebates and Allowances on Purchases, and Rebates and Allowances on Sales. Formerly the practice was to keep a Merchandise account which was charged with purchases, returned sales, and rebates and allowances on sales, and credited with sales, returned purchases, and rebates and allowances on purchases. This plan proves impracticable, however, for the reason that the same account is made the receptacle for both purchase and sale prices, with the result that the balance of the account is not significant. The function of these accounts is illustrated below. Assume that the transactions cover one year, 19—, and that the inventory of merchandise on hand on Dec. 31, 19—, is $25,000.

Merchandise Inventory

19—		19—	
Jan. 1	$ 20,000	Dec. 31 Purchases	$ 20,000
Dec. 31	$ 25,000		

Purchases

19—		19—	
Dec. 31 (For year)	$ 93,000	Dec. 31 Retd. Purchases	$ 3,000
Freight-In	700	Pur. Rebates and Allow.	400
Inventory Jan. 1	20,000	Inventory Dec. 31	25,000
		Profit and Loss	85,300
	$113,700		$113,700

Freight-In

19—		19—	
Dec. 31 (For year)	$ 700	Dec. 31 Purchases	$ 700

Returned Purchases

PRINCIPLES GOVERNING CLOSING OF ACCOUNTS.—There must be a clean break in the accounts at some point as inventories are taken. Everything included in the inventory must have a bill passed for it, either actual or memorandum, or a suspense entry should be made putting the charge into the accounts. Also, products shipped must be billed. Those

waiting shipment, if excluded from inventories, must be invoiced, or, if included in inventories, should not be invoiced. At both the receiving and the shipping end a clean break must be made in both the accounts and the inventory-taking, and it must be at the same point in the transactions.

In some cases everything received may be inventoried, suspense entries being passed for items for which invoices have not been received. In other cases it may be better to inventory only goods received, checked, and passed to stock, and for which invoices have been passed. Afterward a general or suspense entry should be made for goods received or in transit but not yet checked and for which invoices have not been passed.

The inventory at the beginning of the year is transferred from the Merchandise Inventory account to the Purchases account, debit side, while the inventory at the end of the year is transferred to the debit side of the Inventory account and to the credit side of the Purchases account. This leaves the Inventory account standing with a debit balance equal to the new inventory. The procedure may be varied considerably from the above. Thus inventories, purchases, and sales may be carried to a Merchandise account and the balance of this, known as gross profit, carried to Profit and Loss. Whichever procedure is followed, the final result is the same.

INVENTORIES IN THE BALANCE SHEET.—Inventories of merchandise in case of trading enterprises, and of raw materials, goods in process, and finished goods in case of manufacturing concerns, should be included among the **current assets,** because they are in process of being turned into cash in a comparatively short time. The length of time required to accomplish this conversion is not material so long as that is the purpose kept in view. Inventories of this type should not be included among working assets, because these are consumed in the operating process. The U. S. Steel Corp., the International Harvester Co., the Packard Motor Car Co., and many others include their inventories of merchandise, raw materials, goods in process, and finished goods among current assets.

There are certain other items in the nature of inventory accounts which in preparing balance sheets are commonly grouped with inventories, but should appear as separate items. Among these are:

- Consigned goods out for sale
- Advances received on consigned goods (credits)
- Stock in storage
- Advances on goods not received
- Stocks of goods in foreign countries
- Goods in transit
- Inventory reserves (credits)

Responsibilities of Auditors

ENGLISH AND AMERICAN SITUATIONS COMPARED.—In the United States most certificates found in connection with balance sheets in corporation reports indicate that the auditors made careful examinations of the inventories. Sometimes the auditors qualify their statement by indicating that the accuracy of the inventory figures has been vouched by responsible officials of the company. Sometimes auditors state in their certificates that they do not take upon themselves any responsibility for inventory valuations.

---

[9] 2 Ch. Div. 279 (1896).

In the English case, *In re Kingston Cotton Mill Co.*,[9] it was held that an auditor is not a valuation expert, that he is not required to take stock, that in the absence of suspicious circumstances he may rely upon the assertions of the corporation officials, but that if he accepts their certificate as to the value of the inventory of stock-in-trade, he cannot be held guilty of negligence. This does not represent the situation as it exists in this country, however, for here the auditor regards stock-taking as a matter which cannot be neglected or left entirely to the officials of the corporation to determine.

TWO CLASSES OF VERIFIED STATEMENTS.—An investigation carried out by the Federal Trade Commission has shown that verified statements may be divided into two classes:

1. Those in which the certificate is based on an examination of the books without personal supervision of inventories and independent appraisal of all assets with the aid of technical appraisers.
2. Statements verified with the personal supervision of inventories and independent appraisal of all assets.

MEMORANDUM OF FEDERAL RESERVE BOARD.—Probably 90% of statements certified by public accountants fall within the first class. It is desirable, however, that the accounting profession standardize their audit procedure regarding inventories in so far as possible. With this in view the Federal Reserve Board, after conferences with representatives of the Federal Trade Commission and the American Institute of Accountants, has accepted a memorandum applicable to balance sheet audits, in which 27 points are mentioned regarding inventories. That portion of the memorandum which treats of inventories is reproduced below:

Under this caption must be included only stocks of goods owned and under control of the owner. Stocks are often hypothecated and if this is the case the fact should be stated on the balance sheet.

Inasmuch as the accuracy of the profit and loss account is absolutely dependent upon the accuracy of the inventories of merchandise at the beginning and end of the period under review, this part of the verification should receive special attention. When a balance-sheet audit is being made for the first time, the inventory at the beginning of the period should receive as much attention as that at the end, and the auditor should take every precaution to satisfy himself that both inventories were taken on the same basis.

An acceptable program of audit for inventories is as follows:

(1) Secure the original stock sheets if they are in existence and carefully test the typewritten copies with them and with tickets, cards, or other memoranda that show the original count.

(2) See that the sheets are certified to or initialed by the persons who took the stock, made the calculations and footings, and fixed the prices, and satisfy yourself that they are dependable and responsible persons. Obtain a clear and detailed statement in writing as to the method followed in taking stock and pricing it; also a certificate from a responsible head as to the accuracy of the inventory as a whole.

(3) A thorough test of the accuracy of the footings and extensions should be made, especially of all large items.

(4) The inventories should be compared with the stores ledger, work in progress ledgers and finished product records and stock records as to quantities, prices and values, and any material discrepancy should be thoroughly traced.

(5) Where stock records are kept and no physical inventory is taken at the time of the audit, ascertain when the last physical inventory was taken and compare it with the book records. If no recent comparison is possible, select a few book items of importance and personally compare with the actual stock on hand.

(6) Where no stock records are kept, a physical inventory should be taken preferably under the general direction of the auditor. After the inventory is completed, he should apply the same tests to verify its accuracy as if the inventory had been taken before his arrival upon the scene.

(7) When the cost system of a company does not form a part of the financial accounting scheme there is always a chance that orders might be completed and billed, but not taken out of the work in progress records. Especially is this the case when reliance is placed on such records to the extent that a physical inventory is not taken at the end of the period to verify the information shown therein. In these cases the sales for the month preceding the close of the fiscal period should be carefully compared with the orders in progress as shown by the inventory, to see that nothing that has been shipped is included in the inventory in error. Cost systems which are not coordinated with the financial accounts are unreliable and frequently misleading. Special attention should be called to every case in which the cost system is not adequately checked by the results of the financial accounting.

(8) Ascertain that purchase invoices for all stock in luded in the inventory have been entered on the books. Look for postdated invoices and give special attention to goods in transit.

(9) See that nothing is included in the inventory which is not owned but is on consignment from others. If goods consigned to others are included, see that cost prices are placed thereon, less a proper allowance for loss, damage, or expenses of possible subsequent return. This does not include goods at branches, as the valuing of such stocks will be governed by the same principles as apply at the head office.

(10) Ascertain that nothing is included which has been sold and billed, and is simply awaiting shipment.

(11) If duties, freight, insurance, and other direct charges have been added, test them to ascertain that no error has been made. Duties and freight are legitimate additions to the cost price of goods, but no other items should be added except under unusual circumstances.

(12) As a check against obsolete or damaged stock being carried in the inventory at an excessive valuation, the detailed records for stores, supplies, work in progress, finished products, and purchased stock in trade, should be examined and a list prepared of inactive stock accounts, which should be discussed with the company's officials and satisfactory explanations obtained.

(13) The auditor should satisfy himself that inventories are stated at cost or market prices, whichever are the lower at the date of the balance sheet. No inventory must be passed which has been marked up to market prices and a profit assumed that is not and may never be realized. If the market is higher than cost, it is permissible to state that fact in a footnote on the balance sheet.

(14) It may be found that inventories are valued at the average prices of raw materials and supplies on hand at the end of the period. In such cases the averages should be compared with the latest invoices in order to verify the fact that they are not in excess of the latest prices, and also with the trade papers, when market prices are used, to see that they are not in excess of market values.

(15) Make an independent inspection of the inventory sheets to determine whether or not the quantities are reasonable, and whether they accord in particular instances with the average consumption and average purchases over a fixed period. Abnormally large quantities of stock on hand may be the legitimate result of shrewd foresight in buying in a low market, but may, on the other hand, arise from serious errors in stock taking.

(16) Always attempt to check the totals by the "gross profit test" and compare the percentage of gross profit shown with that of previous years. In a business where the average gross profit remains fairly constant this test is a dependable one, because, if the rate of gross profit is apparently not maintained and the discrepancy cannot be satisfactorily accounted for by a rise or fall in the cost of production or of the selling price, the difference will usually be due to errors in stock taking.

(17) In verifying the prices at which the work in progress is included in the inventory, a general examination and test of the cost system in force is the best means of doing this work satisfactorily. In a good cost system little difficulty will be found with the distribution of the raw materials stores and pay roll, but the distribution of factory overhead cost is one that should receive careful consideration, the main points to be kept in view being:

(*a*) That no selling expenses, interest charges, or administrative expenses are included in the factory overhead cost.

(*b*) That the factory overhead cost is distributed over the various departments, shops, and commodities on a fair and equitable basis.

(18) No profit should be included in the price of finished products or stock in trade. The price list should be examined to see that the cost prices of stock are below the selling prices after allowing for trade discounts, and, if they are not, a reserve should be set up on the balance sheet for this loss. If the company takes immediate steps to increase the selling price, however, the amount of this reserve may be limited to the loss on goods which may have been sold since the close of the period to the date of the discovery.

(19) In the case of companies manufacturing large contracts it is frequently found necessary to make partial shipments thereof. The question then arises as to whether it is permissible to include the profits on these partial shipments in the profit and loss account. As a matter of fact, it is evident that the actual cost cannot be known until the order is completed. It may be estimated that a profit will ultimately be made, yet unforeseen conditions, such as strikes, delays in receiving material, etc., may arise to increase the estimated cost. It is better not to include the profits on partial shipments, but information of this character which may have its influence in the decision of the banker upon a proposed loan may properly be laid before him. Of course, an exception should be made in cases where the profit on the partial shipments largely exceeds the selling price of the balance of the order.

(20) The selling prices for contract work in progress should be ascertained from the contracts, and where it is apparent that there will be a loss on the completed contract a due proportion of the estimated loss should be charged to the period under audit by setting up a reserve for losses on contracts in progress.

(21) If a company has discontinued the manufacture of any of its products during the year, the inventory of such products should be carefully scrutinized and, if unsalable, the amount should be written off.

(22) The inventory should be scrutinized to see that no machinery or other material that has been charged to plant or property account is included therein.

(23) Partial deliveries received on account of purchase contracts for material, etc., should be verified by certificates from the contractors, both as to quantities and prices.

(24) Advance payments on account of purchase contracts for future deliveries should never appear in an inventory, but be shown on the balance sheet under a separate heading.

(25) Trade discounts should be deducted from inventory prices, but it is not customary to deduct cash discounts. However, this may be done when it is the trade practice so to do.

(26) While the inventory is being verified, the auditor should ascertain the aggregate sales for the last year. If the turnover has not been rapid, it may be due to a poor stock of goods. Some business men dislike to sell below cost and would rather accumulate a big stock of old goods than dispose of the old and unseasonable stock at a sacrifice. The usual outcome is that the stock becomes unwieldy and funds are lacking to purchase new goods. The inventory and the gross sales may, therefore, have a direct connection.

(27) It may be well to reiterate that interest, selling expenses, and administrative expenses form no part of the cost of production, and therefore should not be included in the inventory in any shape.

SECTION 8

REPORTS

CONTENTS

(For list of forms, see complete table of contents.)

SECTION 8

REPORTS

NATURE OF REPORTS.—The **public accountant's** field of endeavor is limited to his client's financial affairs and their management. He makes independent examinations and submits his findings by written reports as a matter of definite record.

The **internal auditor's,** or chief accountant's, field is confined to the particular business employing his efforts. The reports he prepares also come under the head of financial reports and may be as complete as that of a public accountant, or may be only interdepartmental.

The reports prepared by public accountants may be classified as:

1. Financial Reports
2. Organization and Management Reports

The purpose of this section is to outline the important points to be considered and covered by the accountant in summarizing the facts determined by his examination. As the majority of cases covered call for financial reports, these are given first and chief consideration.

While this section is written by a public accountant, and from his standpoint, the qualifications for a comprehensive financial report are not too exacting to be met by the internal auditor in preparing reports that he may wish to submit to his executives.

WHAT IS A FINANCIAL REPORT?—**Finance** is the science of the management of money and monetary affairs; the control and regulation of revenue and expenditure.

The term **finances** is generally used as meaning resources, funds on hand or coming in, which may be assets or income.

Financing signifies the management of financial affairs for oneself or others; providing funds; devising ways to meet obligations, and conducting monetary negotiations.

A **report** is the formal statement of the result of an investigation, or a record with more or less detail of a specific transaction or transactions of a business venture or enterprise. To make a report is to bring back as an answer, or to give an account, or present information obtained by investigation, or personal observation, or inquiry in more or less detail.

A **financial report,** then, is the formal statement of facts determined by personal investigation or inquiry, relating to the pecuniary resources, income and expenditure, and financial management of an individual, company, corporation, or institution. The report logically falls into a statement as to resources, and a statement summarizing the operations of the management, and the result.

Examinations which accountants are required to make also fall into two groups: (1) investigations as to resources—the balance sheet audit; and (2) investigations as to management and operations. An engagement may call for an investigation of one or more phases of resources, liabilities, or opera-

tions. The character and scope of the report is predetermined by the requirements of the engagement.

The first essential of an adequate and competent report is a clear outline of work to be done and the results sought. The **program of audit**—or outline of engagement—is fully covered in other sections of this manual, but the beginner and experienced practitioner are here reminded that the first step in preparing their reports is the review of the work done as indicated by the checked and signed program. This should not only show records and documents examined, but point out records or documents missing, withheld, or overlooked. The accountant in making his audit does not literally **hear** all the facts but he should **see** them, and hear all explanations necessary to a clear understanding of every transaction that has taken place, making notes from which he can intelligently write clarifying comments.

For Whom Financial Reports Are Prepared

1. BUSINESS EXECUTIVES, DIRECTORS, STOCKHOLDERS.—Operations of trading, manufacturing, mining, public utilities, amusement, and various miscellaneous corporations are predicated on the use and management of capital in the production and sale of goods or service for profit. The executive of today assures himself and his associates that his business has been carried on through a given period in accordance with correct principles and that the written record is correctly stated on books of account. This assurance is obtained by utilizing services of expert accountants to make an independent audit of the books and documents on which are recorded the business transactions under review. The reports submitted on such cases comprise the largest class with which accountants deal.

The scope of financial reports required by **business executives** embraces the transfer of interdepartmental information in written form.

Internal or **interdepartmental reports** are co-ordinated so that there is no duplication and only necessary information transmitted for use when and where needed. Such internal reports have to do with regular routine of business, as, report of receiving department to purchasing department, production department to sales, sales department to general manager, accounting and collection department to treasurer, and treasurer to president. The most common internal report is a condensed summary of cash transactions and resulting balance, trading transactions, and resulting balances in receivables and payables.

Well-trained head-bookkeepers, or office accountants, are capable of preparing regular financial reports comprising balance sheet and operating statements. Such office accountants will do well to follow the outline of reports used by public accountants. They should avoid protracted statements, presenting a reasonably condensed balance sheet and operating statement, the account totals of which may be broken down by subsidiary statements and supporting schedules. Parts of reports so prepared may come from different departments, the bookkeeper in charge of sales ledgers submitting the schedule of receivables, and the bookkeeper in charge of creditors ledgers submitting schedules of accounts payable, etc.

When prepared by internal auditors, these schedules should present more detail for review by the executive interested than is ordinarily submitted by the public accountant. The collection department should have, to guide him in his work, a schedule showing sales terms to various customers, if

they differ, and dates of unpaid items. The treasurer also requires details of payables to aid in maintaining a proper credit standing and assure the taking of all discounts. Schedules of inventory materials may be comparatively prepared, which will automatically point out sluggish stocks and call attention to stock that should be replenished.

The accountant should keep constantly in mind the purpose for which the report, statement, or schedule will be used, presenting all information as concisely as possible, but with sufficient explanation to answer questions that the figures may raise in mind of executive using such reports. See section on "Statistics and Graphics" for additional information.

The following illustrative forms show how statistical information can be prepared presenting much information to executives, that will be readable at a glance.

Form 1—Daily Cash Report
" 2—Daily and Monthly Statistical Summary Sheet
" 3—Daily Statement of Current Assets and Liabilities

On Form 3, "Today's Business" figures simply illustrate the method of adjusting daily balances. They are not intended to show relation of changing inventories to receivables, etc.

FORM 3. Daily Statement of Current Assets and Liabilities

NOTE: Accretions in black. Reductions in red (here given in italics).

For weekly statement, use form wide enough to provide six times the above unit.

This statement enables treasurer to watch relation between quick assets and liabilities. Figures for completing statement are obtained from daily cash transactions, purchase records, and pay-roll accrual.

It serves as a control sheet for placing deposits in relation to bank loans, etc.

2. BANKING INSTITUTIONS.—

(a) **For Credit Purposes.**—Banks and business corporations which loan money or extend credit require borrowers to present a financial report containing a certified statement of financial condition or net worth. The tendency toward review of the latest period's operating statement is growing in such institutions and the request for the full auditor's report is frequent.

A large number of loans made by banks to commercial houses are on the

borrower's own or one-name paper, and are for the purpose of carrying closed transactions over the peak points, as to credit extended, or heavy inventory periods of the business. While bankers pay particular attention to the availability of borrowers' resources, they are vitally interested in knowing what the result of turnovers will be.

In many cases the would-be borrower does not need the bank's assistance in the way of loans as much as the advice to liquidate obsolete inventory stocks, discard unprofitable lines, shorten terms, and readjust his expenditures of money so that they will have the maximum earning capacity, and produce his own working capital.

The accountant may and should advise his client on such matters when the study of his needs discloses such conditions, and when a letter of recommendations or comments on an audit for credit purposes reaches the banker, he is given more than the point of view obtained from the balance sheet alone.

In the preparation of these reports the accountant, as always, should have constantly in mind that his signature to the report means that the figures presented represent facts and that all facts should be presented that have been stated. Any admission that is incorrect or omission of something that should have been reported will mean the loss of the banker's money and confidence.

(b) **For Security Issues.**—The investor who buys stocks or bonds without examining or having examined the latest financial reports of the debtor corporation, does not heed the warning: Let the buyer beware. Responsible underwriters of security issues now have exhaustive examinations made by accountants and engineers as to the history of the company they are about to finance.

Reports called for cover every aspect of business operations, with comparisons over a period of years to show trend of conditions and various aspects of earning power. Balance sheets before refinancing, and balance sheets giving effect to new financing, will be presented, with forecasts as to results to be obtained under new financial programs. Past performance by years, showing earnings and return to stockholders and an estimate of the ability of corporations to pay dividends by economies to be effected or increased earning power of additional working capital, are important phases of these reports. Accountants can assist clients by tabulating past and anticipated results and suggesting the logical presentation of hoped-for earnings which are beyond the facts with which they deal.

3. FOR INVESTORS IN BUSINESS OPPORTUNITIES.—Going concerns are often offered for sale in part or as a whole and are sought by men who wish to make an investment and take an active part in the management of the business. Offer of vendor company is usually on the basis of its condition at a given date, under an agreement to turn over a certain share of interest in its net worth and corresponding control, or a block of stock for a fixed sum.

Investors select an auditor to make the examination at expense of vendor. The report submitted in such cases should present a **Balance Sheet** at the given date, supported by detailed schedules of all assets and liabilities, a **Comparative Statement of Income and Profit and Loss from Operations** for a number of years, with supporting analyses of income and expense accounts, if required by the condition of such accounts.

Whether an appraisal of the plant is contemplated or not, all entries to plant and property accounts from the inception of the business should be examined to see that maintenance and repairs and renewals have not been capitalized and that proper depreciation has been provided.

A complete **Statement of Surplus** will often disclose items which have helped to make a healthy-looking balance sheet and which, while the result of the foresight and sagacity of the business executives, have no bearing on the past or future operations. A case in point is the sale of a building during a period of high local values at a considerable profit, which forced a subsequent long-term lease at ruinous rental.

Contracts, leases, and agreements should be reviewed and a digest of each submitted.

Clients may request examinations as to certain accounts only, as current assets and liabilities, stating that they have no interest in the fixed assets and real property with underlying mortgages.

It is unwise to make engagements so restricted. Any proposition open to negotiation in which an accountant's report is a factor, calls for a complete and exhaustive examination—otherwise questions arise that cannot be satisfactorily answered, and either buyer or seller is put to a disadvantage that will react against the accountant.

Reports to investors of this class call for full comments on all facts presented.

4. CREDITORS', FINANCING, AND REORGANIZATION COMMITTEES.—A business placed or putting itself in the hands of a committee does so for its own protection and for the equitable treatment of all its interests. It may be solvent and operating at a profit but unable to agree in executive board as to future policy; officers and heads of departments may be out of gear. Or it may be unable to meet its current liabilities and, because of hopeful financial reports prepared by its own organization, think that time and additional working capital are all that it needs.

Auditors' reports after examination in such cases should present:

1. Balance Sheet as a going concern, with comparative estimate of realizable assets and ranking liabilities—if liquidated.
2. Comparative Statement of Operations, covering a period of years.
3. Summary of Uncompleted Business, Cost to Complete, and Estimated Profit.
4. Chart of Organization and Memorandum as to Management.

Comments should include the accountant's opinions as to cause of difficulties, and suggest remedies or advice as to continued operation or liquidation. Committees expect these opinions, and they have much weight in conference if report under discussion indicates that the auditor used his brains in preparing it.

5. FOR FIDUCIARIES AND RECEIVERS IN BANKRUPTCY.—The largest percentage of reports prepared for and required by fiduciaries are based on estates and trusts usually in form of income-bearing securities. If an estate or trust owns a going business, a supplemental report on its operation should be prepared supporting the income shown from it in the accounting.

When accountants are called upon to prepare reports for fiduciaries, it is wise to depart from the style used in ordinary financial reports and follow legal requirements of the particular case. The law prescribes the manner in which information must be presented to the court and it is necessary for accountants to acquaint themselves with forms specified by law.

The report which accountants prepare most frequently for fiduciaries is **An Accounting** rendered to the surrogate in connection with judicial settlement of an estate. In preparing this accounting, follow form required by

surrogate. The accounting is summarized in one statement wherein the executor or administrator is charged with all money and property which he receives, credited with all money and property disbursed, leaving on hand the difference between the two which must be accounted for in a later accounting. Various detailed schedules must be submitted supporting amounts entered in Summary Account and vouchers must be included supporting all disbursements by fiduciary.

The accounting should be typed on legal cap. All vouchers supporting disbursements should be numbered consecutively according to order of appearance in schedules of accounting where corresponding voucher numbers should appear.

When the accounting is delivered to client, he can then submit it in its entirety to surrogate or make such changes or additions as he sees fit. Frequently matters come to attention of the accountant, while making the audit of estate records, which could not properly be entered in the accounting rendered to surrogate. It may be advisable to present to the client more detailed information, or information summarized differently than it appears in the accounting. In such cases, it is proper to submit a **second report** supplementary to the accounting and which can follow the lines of the usual financial report rather than the legal form. See section on "Fiduciaries" for forms and procedure.

6. FOR INSTITUTIONS.—Welfare, religious, and educational institutions own and hold property operated for the public good, receive and disburse income, and prepare financial reports periodically to present the results of management. Their endowment funds stand as capital. Property left in trust cannot legally be disbursed and must be held intact. Money or property given outright may be used for current needs, and can be reported as income during the period received. Some institutions fail to carry realty and personalty and underlying encumbrances on books of account, reporting only income and mortgage or bond interest paid.

Accountants' reports should distinguish income assets from endowment or principal assets on balance sheets, and separate liabilities to be paid out of revenue from liabilities against endowment or investment assets.

The **letter of presentation** or certificate should state that all income and property shown to have been received had been properly accounted for; that all disbursements were made on proper authority and were supported by satisfactory vouchers; that all cash and securities had been verified by count or by the properly authenticated certificates. Any exceptions to a clear certificate should be pointed out.

Preparation of Data

ASSEMBLING THE DATA.—Accountants cannot prepare reports from memory. During examinations verified facts are recorded on working sheets; analyses or transcripts of important personal and property accounts are made with reference to books and documents of original entry; and digests of contracts and agreements and full notes of historical facts are prepared.

Accountants' technique is shown by their working papers. If properly prepared, little difficulty is experienced in drafting clear and competent reports. Prepared in the field, they should provide:

1. Statements and schedules to be included in report or to support items appearing in such statements or schedules.

2. Record of work done, with notes relating to items or conditions calling for comments.

Auditors should have clearly in mind the purpose for which work is being done and points to be covered by the report. The work should be outlined in **program of audit,** and as each step is completed the fact noted thereon.

Each statement or schedule should be **headed** thus:

1. Correct name of company, firm, or proprietor.
2. Title or description of what the sheet purports to be.
3. Date or period covered.
4. Date prepared and name of auditor. (May be placed in upper right-hand corner of sheet.)

On **working papers,** as in final report, make all headings of statements explicit. Better a long, full description of the exhibit than a brief heading that leaves a question. This is particularly important in preparing statements for use in negotiation or litigation. A leading authority on financial reports states: "Every item of current assets is open to question." The heading should be so clear that no question can be raised as to what the exhibit purports to be.

Working papers should be prepared so that book accounts can be adjusted for correct presentation on balance sheet of the report. For example, Office Cash Fund, if made up of cash and I O U's, should become on the report:

Cash on Hand
Sundry Debtors, or
Due from Officers and Employees

Notes Payable, if given for bank loans and merchandise purchased, should be presented as:

Notes Payable to Banks
Notes Payable to Merchandise Creditors

The first working paper to be prepared is the **General Ledger Trial Balance.** This becomes an index of the accounts under review and for working papers. In drawing it from the general ledger, posting references will indicate the books of original entry. It should be headed as follows:

The Famous Rockhorn Company
General Ledger Trial Balance
Working Sheet Covering the Period from January 1 to June 30, 19....

7–14–19...
C. Hoyt

(Wide columnar sheet of analysis paper with column headings as indicated beginning on the left-hand side.)

1. Schedule or Index No.
2. Ledger Folio
3. Account Classification
4. Trial Balance—January 1, 19....
   (a) Debits
   (b) Credits
5. Trial Balance—June 30, 19....
   (a) Debits
   (b) Credits
6. Adjustments and Transfer Entries
   (a) Debits
   (b) Credits

7. Profit and Loss
    (a) Debits
    (b) Credits
8. Assets and Liabilities
    (a) Debits
    (b) Credits
9. References and Notes or Comments

It is advisable to allow space between each entry for **brief notes** and to prevent overcrowding of adjustments and transfer entries when more than one entry affects a single account. Adjustments and transfer entries should always be prepared in form of journal entries, numbered or lettered consecutively, with full and complete explanations following each entry, and filed immediately following the working sheet.

Final amount on each sheet should be amount appearing on statement or schedule in report. This is important. The auditor should always be able to locate in working papers each figure presented in his report. Forms and headings of various working sheets used in audits are illustrated in section on "Audits and Working Papers."

As a general rule, a **separate sheet** should be used for each item which is the subject of a schedule or of notes in working papers, if the matter contained therein is too voluminous to be noted on working sheet proper, in order to facilitate proper arrangement of papers upon completing work.

When an audit is completed, all papers should be arranged in same order as items to which they relate appear on balance sheet or other statements included in report, securely fastened together and indexed. The **file of working papers** is the accountant's evidence and proof of figures submitted in report, and plain trail back to ledger figures.

Public accountants and internal auditors not well trained in the proper method of handling working papers should familiarize themselves with such books as "Accountants' Working Papers" by Palmer and Bell, and "Audit Working Papers" by Jackson; also appropriate topical treatments found in general accounting works. See also section on "Audits and Working Papers."

Methods of Preparation

PROCEDURE.—The outlines of engagements received from clients suggest the scope and character of reports desired. The work has been laid out and supervised with a view to obtaining certain results. The report is not merely confined to the client's suggestions, but may be amplified or contracted as results obtained warrant.

When field work is completed, a **rough draft of report** is drawn. The working papers are reviewed to see that all accruals and connecting and adjustment entries have been made, that all capital expenditures have been explained, all supporting verifications such as bank certificates and confirmation of loans have been received, agreed and filed in order, and that proper notes have been made explaining unusual accounts or items.

The **Balance Sheet** and **Income Statement** are prepared, any schedules necessary to support such exhibits being drawn from the working papers and properly headed for typing.

With these statements in hand the report writer, whether a partner, supervising accountant, or a member of the organization who acts as editor and has no other part in the engagement, drafts or dictates the **letter of presentation** and **comments, if any.**

The **aim of the report writer** is to submit all possible information in the most direct and concise form. Clients ordinarily are not concerned as to how the audit was made. Their interest is in statements presented over the signature of the firm or person selected to do their work.

All that is now left of preparation is mechanical and follows well-defined procedure.

Longhand drafts of exhibits, schedules, and notes should be stamped with a form, as follows:

DATE. . . . .
PREPARED BY. . . . .
ADD. & EXTEN. CKD. BY. . . . .
TYPED BY. . . . .

and go to the typist properly initialed.

Checking all footings and extensions on report drafts will often forestall the necessity of retyping matter that comparison after typing shows to be incorrect.

Instructions to the typist should be explicit and the following form may be used and attached to the draft:

FORM 4 Specifications for Report

The **appearance of reports** contributes largely in creating favorable or unfavorable impressions in minds of readers. The principal factors in appearance are: (1) paper, (2) typing, and (3) binding.

PAPER.—

Size.—Two sizes of paper most frequently used for reports are letter size, 11 x 8½ inches, and legal size, 13 x 8½ inches, with double sheets, 11 x 16½ inches and 13 x 16½ inches, respectively, for displaying balance sheets and columnar statements. Letter size, 11 x 8½ inches, is to be preferred, as reports that size will fit into standard letter files found in every office and file drawers of practically every executive's desk, whereas legal size, 13 x 8½ inches, requires legal-size files for upright filing and must be laid flat if filed in desk drawers.

Stock.—A good grade of thin bond paper, with which at least six copies can be made at one writing, is desirable. When more than six copies of a report are required, two or more typings will be necessary, or the use of one of the several makes of duplicating devices on the market.

Many accountants use paper imprinted with the firm name at the bottom of each sheet to guard against misuse of their reports. Any accountant can have report paper manufactured and watermarked with the firm name. This practice has the disadvantage that statements typed over an imprinted name are sometimes used away from accompanying certificate and comments. Statements that appear to have been prepared by accountants are often given unwarranted credence.

TYPING.—Use type easily read. Matter should be spaced sufficiently to avoid appearance of crowding. Better to use two sheets than have matter crowded on one. Rulings should be used sparingly and should be typed.

Excessive underscoring of captions and side titles should be avoided. As a general rule, captions and side titles when capitalized should not be underscored. Use of capitals tends to place sufficient emphasis upon the wording.

COMPARISON.—As the report is typed, the copy to be retained by the accountant should be stamped for comparison as follows:

DATE....................................
COMP'D BY...............................
ADD. CKD. BY............................
REF. CKD. BY............................
CORR. EXAM. BY..........................
APPROVED BY.............................
SIGNED BY...............................

The comparing should be done by two—one reading from the typed copy to the original. All corrections should be made in ink and should remain as so corrected on the retained or office copy and a check mark made in the left margin to call attention to the line and correction.

All additions and subtractions should be checked on the typed copy. Transposition of figures may not be caught in reading but will be found by proving additions and subtractions.

If all extensions have been verified on the working sheets as recommended above, it is not necessary to check them again on the typed copy.

The final review in the report typing department is to check and verify all references.

Before binding, the completed report should be passed on by the report writer or supervisor. No report should be signed before being bound.

Preparation of internal reports may follow closely the directions laid down for public accountants. All forms should be standard letter size or units thereof. The same care should be used in proving, preparing, and checking as that given to a public accountant's report.

BINDING.—Reports should be permanently bound with eyelets or other fasteners that cannot easily be removed. For covers use a good grade of cover stock, flexible enough not to crease badly when folded, and a color not easily soiled.

When an exhaustive examination has been made, or reports on a consolidation of interests have been prepared which will receive heavy use, or when it is desired to dress a report in an especially attractive manner, limp leather covers may be used and the report titles and accountant's name imprinted in gold letters.

Whatever the type of cover selected, the title should be centered on the cover and should include:

1. The name of the company, firm, or proprietor whose accounts are the subject of the report, such as:

   THE FAMOUS ROCKHORN COMPANY

2. The title, which should be descriptive of the matter contained in the report, such as:

   BALANCE SHEET
   or
   REPORT ON EXAMINATION FOR THE PERIOD

3. Date or period covered, such as:

   JUNE 30, 1923
   or
   FROM JANUARY 1 TO JUNE 30, 1923

Presentation of Reports

The general practice of accountants in submitting financial reports after audit is to address a letter of presentation to the proper officer, embodying such certificate as may be given, with exhibits attached, as:

Balance Sheet—Exhibit A
Income and Profit and Loss Statement—Exhibit B

CONTENT AND ARRANGEMENT OF STATEMENTS.—A Balance Sheet—or Statement of Net Worth—is the only statement that can be obtained from the trial balance of a single-entry set of books, and the comparison of the net assets with those of a previous date tell whether the operations between those dates resulted in a profit or a loss. This method was for many years and still is employed by some business men, who never know whether profits or gains after having been made may not have strayed away or been stolen.

It is certain that clients are most interested in the final figure of the report—the net result of operations—and that is rapidly becoming of supreme interest to lending bankers.

One of the prominent New York banks publishes in newspaper and other advertising space a statement of condition that can be understood by the average person. The presentation of the statement is based on the theory that, as it is operating largely on its depositors' money, they will have the keenest interest in how much that is, and how it is held or utilized by the bank. The report reads to this effect:

"We owe our depositors this amount of money, \$..........,
And we have to meet that debt, the following:"
(*Enumerating its resources*)

It would, no doubt, please many clients to have presented to them:

1. Result of Operations for the Period and How Produced.
2. Financial Condition at the end of the Period.
3. The Auditor's Comments and Explanations, if any are required.

The balance sheets which members of the American Bankers Association require of borrowers, the Federal Reserve Board form, and the set-up on the 1922 U. S. Internal Revenue Income Return Blanks, maintain the so-called **American form** of arrangement—i.e., assets in the order of their availability; liabilities in the order of their preference.

This arrangement is so thoroughly reasonable and logical, that no other arrangement will be considered here. The banker wishes to see the ratio of **liquid or available assets** to **liabilities to creditors,** and the present-day investor and the stockholder is more anxious to know that there are liquid resources for paying dividends and that his shares can be converted readily, than that they are held in a permanent capital investment.

The Federal Reserve Board form is presented elsewhere in this manual. Accountants can safely follow either the Federal Reserve Board form, or the outline on the federal income tax blanks.

Income and Profit and Loss Statements show the amount of gain or lack of gain resulting from the ownership of assets or professional or business activities, over a stated period of time, and give sufficient detail to show the reason for the result obtained. The term **income** is generally used to describe results obtained from professional practice or where a fund of assets is held in investments or real estate. The term **profit and loss** is used to describe results obtained from trading, manufacturing, or merchandising. When the result is produced from both classes of activities, the term **income and profit and loss** describes the combined result.

Statements of Income and Profit and Loss may be displayed in **running form** or as an **account.** The former is preferable. The account form as debit, credit, and balance, looks forbidding to many men unfamiliar with accounting procedure and should not be used if a direct statement can be presented. In the construction of the running form of statements, the gross income or gross sales is entered at the top of the sheet under the heading and offsetting charges are deducted. These deductions should be so classified as to bring out clearly the effect of each such classification upon the final result shown at the bottom of the statement. To give emphasis to the effect of each item or class, percentages should be shown to the right of the money columns.

If the detail required to show clearly the effect of an item, or group of items, is voluminous, it may be given in a subsidiary schedule or statement, the total of which will support the amount entered on the major statement. Thus, an analysis of sales by departments or commodities, or cost of goods manufactured, may be submitted on supporting schedules.

The proper **technical construction** for the auditor's financial report is:

1. Letter of Presentation
2. Balance Sheet (as an exhibit)
3. Surplus (as an exhibit)
4. Statement of Income and Profit and Loss for the Period (as an exhibit)
5. Supporting Schedules

Mr. Ralph Rockhorn, President,
The Famous Rockhorn Company,
New York City, N. Y.

Dear Sir:

In accordance with your instructions, we have audited the books and records of your Company for the six months ended June 30, 1923, and submit the following:

EXHIBITS

A Balance Sheet—June 30, 1923

B Statement of Income and Profit and Loss for the six months' period ended June 30, 1923

Cash—$9,000.00

We verified the cash on hand by actual count and the cash on deposit by certificates from the depositories.

Notes Receivable—Trade—$500.00

The notes receivable, which we verified by inspection, were all made by the F. F. Stores, Inc., New York, and were as follows:

Dated	Due	Interest	Amount
Jan. 23, 1922	July 23, 1923	6%	$150.00
Jan. 23, 1922	Jan. 23, 1924	6%	150.00
Jan. 23, 1922	July 23, 1924	6%	200.00
			$500.00

Accounts Receivable—$26,700.00

We scheduled and classified the open balances which appeared in the customers ledger at June 30, 1923. The following is a summary:

Age	Amount
30 days and under	$25,053.39
30 to 60 days	387.58
60 to 90 days	....
Over 90 days	1,259.03
	$26,700.00

After discussing the delinquent accounts with you, we believe you are correct in considering them all good and collectible.

Sundry credit balances appearing in the accounts receivable we have shown as accounts payable on the balance sheet.

Inventories—$32,300.00

This total is the result of the physical count at June 30, 1923, made at our direction and under our supervision. This figure is verified by your costs and book inventories, and you have certified it to us as representing the correct amount of merchandise and supplies on hand, valued at cost or market, whichever is lower.

We have checked all additions and tested extensions and prices.

Notes Receivable—Blank Manufacturing Company—$32,500.00

These notes are of an associated company located in Newark, New Jersey, as follows:

Dated	Due	Interest	Amount
Aug. 30, 1922	On Demand	6%	$ 8,000.00
Oct. 10, 1922	On Demand	6%	14,500.00
Nov. 29, 1922	On Demand	6%	5,000.00
June 10, 1923	On Demand	6%	5,000.00
			$32,500.00

FORM 5a. Form of

Investments:

Second Mortgage on Real Estate—$2,000.00

This mortgage is dated April 29, 1920, and was due April 29, 1923. The original amount, $5,000.00, has been reduced to $2,000.00 and bears interest at the rate of 6% per annum.

Blank Manufacturing Company Stock—$32,000.00

This stock is shown at cost and is represented by:

216 shares Preferred Stock, and
243 shares Common Stock.

Net Cash Surrender Value of Life Insurance Policy—$800.00

The cash surrender value of the insurance policy carried on the life of Mr. Ralph Rockhorn, President, is stated in a letter of the Associate Actuary of the Mutual Life Insurance Company,

to be	$8,700.00
against which a loan has been made of	7,900.00
leaving a net cash surrender value of	$ 800.00

Fixed Assets:

Machinery and Equipment—$97,000.00

This account shows an increase of $5,000.00 during the six months' period.

We examined vouchers supporting additions to this account, all of which appear to be proper charges thereto.

Accounts Payable—$21,200.00

We examined transactions subsequent to June 30, 1923, to satisfy ourselves that all the liabilities of the Company at that date had been entered upon the books, and you have certified to us that all the known liabilities at June 30, 1923, were recorded upon the books of account prior to that date or made known to our representative.

7%—10-Year Gold Debenture Bonds, Due March 15, 1933
(Authorized $100,000.00)
Issued—$4,600.00

The Central Union Trust Company, Trustee, has certified to us that they held unissued bonds amounting

to	$ 94,000.00
and we inspected unissued bonds in the possession of the Company amounting to	1,400.00
Total Unissued	$ 95,400.00
leaving a balance, representing issued bonds of	4,600.00
Total Authorized	$100,000.00

Employees' Subscriptions—$6,500.00

This amount represents payments on bond subscriptions by employees of the Company.

* * *

Subject to the foregoing comments, we certify that the attached Balance Sheet and Statement of Income and Profit and Loss correctly present the financial condition of The Famous Rockhorn Company at June 30, 1923, and the result of operations for the six months' period then ended, respectively, and are in agreement with the books.

Yours very truly,

....
Certified Public Accountants.

Accountant's Report

If there have been items affecting the Surplus Account so that a clear presentation of such changes cannot readily be made on the Balance Sheet, prepare a separate exhibit of Surplus to follow the Balance Sheet exhibit and to which the end figure of the Statement of Income and Profit and Loss would be carried.

COMMENTS.—It may be stated as a fact that the most competent reports often have the fewest comments. Too often, comments and qualifications are called for because the report writer finds when reviewing the working papers that the examination was either shrewdly limited by the client,

Accountant's Report—*Continued*

Presentation here of other balance sheet and operating statement forms would tend to parallel and duplicate the very complete and satisfactory arrangements presented in Bell's "Accountants' Reports" which also contains instruction and information valuable to all accountants who have the preparation of financial reports in hand.

The accountant should consult other sections, such as those on "Con-

solidations" and "Net Income and Surplus," for information of a special type which may be useful in preparation of statements of certain types.

Filing Reports

IN THE ACCOUNTANT'S OFFICE.—The method of filing report copies should be such as to enable one to locate any desired report at once. Two copies are frequently prepared for the accountant's files, one to be filed with working papers supporting it, where it will always be at hand when referring to the papers. It is advantageous to number serially each file of working papers, cross-indexing to a loose-leaf or card alphabetical file. This method avoids frequent shifting of files which results from assigning a file number to each client and then filing all papers under such number.

Where there are several folders for a client, each containing working papers and report copy covering a period, they may be labeled thus:

Serial No. 297—The Famous Rockhorn Company—Audit Working Papers—5 Years Ended December 31, 1922.

Serial No. 568—The Famous Rockhorn Company—Tax Investigation—15 Years Ended December 31, 1922.

Serial No. 603—The Famous Rockhorn Company—Audit Working Papers—Year Ended December 31, 1923.

The alphabetical file for The Famous Rockhorn Co. shows that working papers have been filed under Serial Nos. 297, 568, and 603, and to what particular engagement each file relates.

The second retained copy of report may be filed in a special "Report File," either alphabetically or numerically as outlined above.

IN THE CLIENT'S OFFICE.—Many executives keep certain important papers near at hand for ready reference and the type of desk commonly used by them is fitted with a double-depth file drawer to take regular correspondence folders. Accountants' reports, prepared on commercial letter-size paper, conveniently fit into such a file. Safe cabinets and safes are also frequently fitted with file drawers of either letter or legal size. Accountants' reports should be filed in a safe place accessible only to the persons entitled to have them and available at all times when required. Reports covering different periods should be filed chronologically so that taken together they will give a complete history of the financial life of the business.

Reports on Organization and Management

CHARACTER OF REPORT.—Accountants are usually required to render reports upon organization and management, by reason of engagements secured through: (1) prestige of their organization or certain of its members; or (2) recommendations previously made by them after an initial audit. In either event, the purpose remains the same and is defined by terms of the engagement, supplemented by such sanctioned variations as may be found necessary as investigation or survey develops.

As with financial reports, it will be found, despite the tendency toward standardized organizations, methods, and accounting, that each engagement requires a report similar in principle but differing in essential respects.

In general, it is the accountant's aim so to organize the client's methods

that economic facts are faithfully followed by the records, duplication of effort is eliminated, maximum results are obtained by direct procedure, and the whole enterprise will be co-ordinated and will function as an organization, not as a series of independent departments.

METHOD OF PRESENTATION.—Methods by which the accountant's findings may best be presented to the client depend upon the specific engagement and may be either **analytic** or **synthetic.** The second of these methods is the one most usually followed, and consists in tracing purchase orders through to cost of sales, and sales orders to cash receipts. The flow of goods is presented with the accompanying records and accounts. The books of original entry are described, their posting to charted accounts defined, and then periodic statements are illustrated and their preparation scheduled from the accounts provided.

Supplementing the description of procedure, it is also usual to present **organization charts** comprehending the functions and duties of officers, departments, and individuals therein, together with a **program of procedure** to accomplish the results sought by the installation.

The **analytic method** reverses the order of procedure described for the synthetic method. The body of the report begins with the submission of the plan of general organization, and pursues the functions of the several economic phases of the business to their inception.

The desire of executives to place the operations of their businesses upon a **scientific budget basis** has led to increased demands upon accountants for the rendition of these reports.

CONDITIONS TO BE CONSIDERED.—Whenever accountants are engaged to install new methods for clients, it is necessary for them to conduct a campaign of education with the client. However ready the client may be to accept suggestions, the finished work and its successful operation is contingent upon the thorough mastery by the client and his employees of the new methods to be followed. Illustrations should be so explicit that they permit of no misinterpretation.

Overlapping of duties, duplication of work, lack of co-ordination, or merely general confusion in departments, are conditions often found. Frequently, these faults are a reflection of the management's own personality. Reporting upon such conditions must be tactful but their elimination nevertheless insured. Relations between clients and their accounting advisors should be upon such a professional plane that these errors in organization may be discussed during the installation and corrected at the source.

Examination of client's methods may show that **overhead expenses** are so high that the client is either making profits in spite of mismanagement or that the whole cause of losses is therein contained. It is frequently a difficult problem to convince the client that expenditures are being unnecessarily made, and quite as difficult to persuade him to spend additional money to make money, but the accountant is bound to advise in relation to both conditions.

Other **faulty conditions** frequently found are:

1. Cost system not controlled by general books, but purely statistical.
2. Interest on investment included in inventories.
3. Obsolete stock carried along in inventories.
4. Unsuitable methods of applying overhead.
5. Lost discounts on purchases.
6. Discount on sales improperly allowed.

7. Freights not charged against vendors in accordance with purchase terms.
8. Over or under purchase of materials.
9. Repairs not made, or repairs capitalized.
10. Depreciation insufficient, excessive, or written off amount of assets, etc.

CONTENT AND USE OF REPORT.—The **chief consideration** in rendering a report upon organization and management is the use to be made of it. The report may be entirely advisory and suggest results hoped for, or it may be drafted as a manual of procedure. If a report of recommendations, it will cover methods, routine accounts, management, and will outline required changes.

Where the report is to be used as a manual, it is desirable, in the case of large organizations, to split it into a series, appropriate parts of which may be placed in the hands of respective department heads, while reports in their entirety would be prepared for administrative officers. In this case procedure and contents of accounts, etc., will be presented in elaborate detail.

Instructions for routing records, entering upon books of original entry, posting to general and subsidiary ledgers, etc., should be direct, terse, and explicit. The directions should set forth the exact and entire thought it is desired to convey. For instance, in posting the sales ledger from the sales book, the directions might be: "Currently post all sales invoices to the individual customers' accounts, indexing with the sales invoice number, and noting upon the face of the account the car number of shipment." Such instructions should be didactic, positive, and authoritative.

In content, reports on organization and management should parallel economic phases of the particular business enterprise, either analytically or synthetically. The co-ordinated organization as a properly functioning unit lies at one end of the report and the inception of the various business activities at the other. Thence through the report the accountant must, by careful reasoning, clearly and consistently trace the methods, records, and accounts.

In form the report must be so presented that, in spite of the wealth of detail it may contain, it is readily understood as a whole. Aids to this clarity are a prefixed **index of contents,** appropriate center and subsidiary **side captions** for the text, and **graphics** of organization, flow of materials and records, books of original entry, and charts of accounts.

Examples of forms and statements introduced or recommended should be submitted with the text.

SECTION 9

CLASSIFICATION

CONTENTS

SECTION 9

CLASSIFICATION

DEVELOPMENT OF ACCOUNT CLASSIFICATION.—Until recently, the subject of account classification has received little attention. Prior to about 1890, business was largely local in character; margins of profit were large, and a simple set of accounts met most requirements. Use of the old-fashioned merchandise account was not abandoned by many large concerns until 10 years ago. Recently, competition has grown more keen and the business unit has increased in size and complexity, while manufacturers have begun to take an interest in **costs.** There has grown up an increasing demand for facts, particularly facts concerning quantities and values. The word **efficiency** has taken on a special significance. Under these conditions the simple system of accounts which answered requirements 25 years ago has given way to improved methods of collecting and reporting business and financial facts.

Account Classification Stimulated by Interstate Commerce Commission's Work.—In this development of better reporting methods, the work of the Interstate Commerce Commission has had a stimulating effect. The Commission published a classification of accounts for railroads which went into effect July, 1908; and while the first effort of the Commission met with criticism, its influence on private business was marked. The profession of accountancy was beginning to make its influence felt. In many instances, first audits of business organizations disclosed the need of more suitable classifications of accounts which led to engagements to install **systems** with their accompanying classifications of accounts. These systems have reduced the manual labor of future audits, and have furnished information which modern competitive conditions demand.

Influence of Trade Associations.—Still later, trade associations inaugurated the movement for **uniform systems of accounts.** To some extent the motive of price regulation prompted this movement in many quarters because undesirable competition resulted from ignorance of costs, this in turn being due to poor systems of accounts. There exist today many systems of uniform classifications of accounts developed by trade associations.

Principles and Procedure

FUNCTIONS OF CLASSIFICATIONS OF ACCOUNTS.—Classifications of accounts have two primary functions: They show the relationships of the facts of business in their proper proportion and perspective. They also provide means for testing the business organization. Many vital facts of business are disclosed by preparing a balance sheet and an income account based on a properly devised classification of accounts. Capital invested in a business, whether owned or borrowed, must be properly accounted for.

Financial genius and legal skill create conflicting interests in property; the balance sheet should disclose relationships existing between the business as an entity and outsiders. In addition, it must set forth the relationships of the interests as between themselves. Two or more legal interests may have equities at one and the same time in one piece of property. General and specific liens must be distinguished. These may be called the **external aspects** of the balance sheet.

INTERNAL ASPECTS OF BALANCE SHEETS.—On the other hand, we are also concerned with relationships which may be designated as the **internal aspects** of balance sheets. A large public utility, supplying electricity, may be required by law to show its total investment in prime movers, or transmission lines, or what not, in the aggregate; undoubtedly this is interesting and valuable information. The management is more concerned to know its total investment in any particular operating unit, so that relationships between property and net income from operation may be traced more readily. Classifications which fail to provide for all relationships do not meet the requirements. In like manner, income accounts present their own special problems no less complicated in many instances. In one sense, income accounts may be said to be gauges of efficiency of management. All factors which produce income and which affect costs must receive proper expression in the accounts, so that fair and intelligent deductions and comparisons may be made. On the other hand, some elements which influence the final result cannot be adequately or properly expressed in pecuniary terms, although unerringly reflected in the final result. These factors, usually intangible or psychological in character, render the most exacting classification of accounts of doubtful value as an index of efficiency under certain conditions.

Business is concerned with **physical** as well as **pecuniary** relationships. The dollar is a fluctuating and unreliable instrument of measurement. In periods of rapidly changing price levels, the same physical facts may be reflected by varying monetary results in different periods. Differences must often be explained by reference to other fact relationships than those shown by the classification of accounts. For example, comparative statements as to cost of direct labor may be affected by climatic conditions, general unrest, labor conditions in other industries, or the "esprit de corps" within the organization.

LIMITATIONS OF A CLASSIFICATION OF ACCOUNTS MUST BE RECOGNIZED.—Important as properly devised classifications of accounts are, one must not overlook fundamental limitations which surround the most perfect classifications. It is not enough to have proper classifications of accounts; there remains the necessity of applying other tests to the results shown before definite and reliable conclusions may be safely drawn. Many practical situations arise within a given organization which often are purely matters of policy. Where this condition of affairs exists, the classification must be devised to meet the special situation. In some cases, allocation of expenses when ascertained, is a matter of arbitrary decision on the part of the administration. Unfortunately, outside factors, such as income tax laws, have influenced practice on this point. So long as influence of outside factors is permitted to control allocation of expense items, just so long will the limitations of scientific classification be manifested.

PROCEDURE IN CLASSIFICATION WORK.—That a proper classification of accounts may be prepared, it is necessary to survey the conditions

of a given business. Broadly speaking, there are two conditions under which classifications are prepared: the first, that of an entirely new venture just commencing operations; second, that of an existing organization.

Taking up the latter condition first, one has here some basis for study. A complete analysis of operations of the undertaking is required. It may be helpful to remember that expenses may be classified in many ways, depending on the purpose for which the classification is required. One should study the form of organization and control under which the particular business operates. The **prime purpose** is to locate responsibility, and responsibility depends upon the type of control which the organization employs in conducting its affairs. Often these factors are found to be as follows: production is in charge of one official or partner or manager; distribution or sales in charge of a second; financing in charge of a third. Under this scheme of operation, the classification of accounts should be devised so as to direct the attention of the management to the group of related expenses. An analysis of past operations discloses what the expenses have been under the several functional divisions. Accounts should be provided for each element of expense which past experience reveals as relatively important from the functional point of view. In determining whether or not a special account should be provided for any special element, consideration should be given to the following facts: (1) expenses tend to increase rather than to decrease; (2) relatively insignificant factors today may be vital factors next year; and (3) volume of business directly influences the importance of any special account.

A perplexing problem faced in this work is the fact that scarcely any two businesses are exactly alike in all respects. There are differences in volume of business transacted, differences in personnel and management, differences in size and nature of operations. Manifestly, discrimination cannot be so carefully made in businesses where volume of business amounts to $50,000 as where it is ten times as great.

TENTATIVE CLASSIFICATIONS ADVISABLE.—Unless the system builder has had an unusually wide range of experience, it is probably better to attempt a tentative classification only at the outset. Experience will serve as a safe guide for future revisions. Moreover, the form of organization and control may often be changed as a result of facts disclosed by the tentative classification. Bearing in mind the pertinent local conditions, the procedure is in many cases somewhat as outlined below.

PLANT AND EQUIPMENT CLASSIFICATION.—Present value of plant equipment must be ascertained. This should be arranged to show value of equipment employed in functional processes or departments. If this is done proper allocation of depreciation charges to product passing through the department may be provided for and, in addition, the management will be able to determine whether or not the proper balance has been preserved in the investment in equipment for the several functions or processes. Repair costs naturally follow a similar classification. Any proposed expenditure for new equipment must be justified in the light of the present investment and needs of the organization or the productive process. This method of procedure provides for a definite and effective control of the investment in equipment and proposed investments in additional equipment and, if properly arranged, permits of redistribution physically or statistically as occasion requires. It leads directly to the next step, namely, preparation of an annual budget for additional equipment, for repairs and

maintenance of present equipment, and for preparation of depreciation schedules and investment schedules for insurance purposes.

MANUFACTURING EXPENSE CLASSIFICATION.—These expenses arise in production of the commodity or service offered for sale. No expenses should be included in this group which are not under direct control and influence of the production manager. While it would seem to be a simple matter to determine this, in practice many perplexing problems must be solved. In some cases, desire to obtain unit costs brings up problems in distribution of intradepartmental expenses and in allocation of indirect expense items. At least, the classification may provide for determination of those expenses which are direct in nature and about which there is no question, allowing for the separate showing of items about which some question may arise. Moreover, from year to year, as production changes, the importance of any one element may vary correspondingly.

SELLING EXPENSE CLASSIFICATION.—There is usually less difficulty in working out a suitable classification for this class of expenses than in case of production expenses. This class includes all expenses incurred in marketing and distributing the product or service offered for sale, and it should not include items not under direct supervision and control of the responsible head of this division of the business. Subclassifications by territories or products are often desirable. Few undertakings are able to show what the marketing costs of any particular product are, and probably one of the greatest fields for future effort lies in the direction of marketing research. The expense classification provided for this group may depend upon the classification provided for the sales. The introduction of mechanical devices for the purpose of building up summaries of classes of goods or service sold as well as distribution by territories is often a valuable aid to management.

FINANCIAL EXPENSE CLASSIFICATION.—In many businesses, expenses incurred in planning for the receipt and disbursement of funds, raising of money for capital purposes and other incidental elements of financing, are of large proportions. In some cases, one of the vice-presidents may have this special phase of the work in his sole charge and custody. Where there is a separate office to handle the finances, the expense classification should be devised to provide for their control.

ADMINISTRATIVE EXPENSE CLASSIFICATION.—These expenses comprise all expenses not provided for above. The detail with which these expenses should be classified depends upon a number of circumstances, but perhaps the principal element in determining whether or not a special account shall be raised for any particular element is the amount of money involved.

RELATION OF ACCOUNT CLASSIFICATION TO BUDGET-MAKING.—Use of the budget system is growing in business and a properly prepared and corrected budget is almost essential to a modern organization. Installation of a proper system of account classification is a preliminary to scientific budget-making. Hence, while the classification serves to measure efficiency of management, it also paves the way for budget-making. Budgets imply the allocation of responsibility; on this account the preliminary study of the form of organization has been emphasized in preparation of a classification of accounts.

OTHER EXPENSES.—In some instances, business organizations have expenses that do not fall within the above general classifications. They

may or may not be important; frequently these items fluctuate widely in amount and importance from year to year. The classification of accounts must provide for them, but owing to the uncertain nature of the items, no general provision can be made for them until they arise.

ASSET AND LIABILITY CLASSIFICATIONS.—Reference has already been made to many of the factors which govern the preparation of a classification of accounts for these items, exclusive of plant and property. It may be well, however, to refer again to the fact that while the plant and property classification by functions is essential, this may not furnish the necessary subdivision of the assets so as to show the various legal interests that may hold equities in the several units of property. More attention has been devoted to classification of property and equipment by functions or departments than to classification by legal interests. The latter may or may not be of vital importance, but should be noted for its possible effect upon the financial statement to be submitted to investors or creditors.

ACCOUNT CLASSIFICATION FOR NEW VENTURES.—The problem of providing suitable classifications for new businesses is more difficult. If the system builder has had experience in a similar undertaking, his experience will afford useful suggestions. If he lacks this experience, careful study of the organization and processes is necessary. The imagination must often be drawn upon and the classification of accounts at the outset must be of the most temporary character. The general outline discussed above should be followed in most cases. If the accountant can follow the transactions from month to month during the first year, the system of accounts provided at the outset may be extended as need develops. The accounts of the earlier months may be analyzed and redistributed to conform with the amended classification. At end of first year of operation, the classification of accounts should assume more definite form and scope.

FUNDAMENTAL BASIS OF CLASSIFICATION.—The fundamental basis of classification consists in enumerating all the elements of assets, expenses, liabilities, and income. These elements must be carefully considered for their possible effect and importance in the final results—the balance sheet and income account. This is the **process of analysis.** To avoid having too many accounts in the general ledger, it may be desirable to provide subsidiary ledgers in which to carry some of the detail accounts; especially if a cost system is contemplated. In the latter event, controlling expense accounts may be provided in the general ledger or in the cost ledger and detail accounts in subsidiary ledgers. Where the accounts are numerous by reason of the necessity of providing for details, expense controls are established for the purpose of grouping. This is the **process of synthesis.** As a rule, it is not possible to provide in advance for all accounts required. Some may be regrouped or abandoned, if experience shows this to be desirable. Certain accounts may have to be redistributed. Good classifications are not developed immediately. Tentative classifications must be studied and modified to suit the requirements of particular cases. This involves much study and experimentation.

Symbolization

USE OF SYMBOLS.—Two systems of account designation are commonly used—the **mnemonic** and the **numeral** systems. A third system sometimes employed is a combination of both. Under mnemonic systems, letters are

intended to remind the reader of the words for which they stand. Hence one symbol can mean but one thing at any one time.

Each of the two systems has its **advantages** and **disadvantages.** The decimal or numeral system cannot be made mnemonic and so does not aid one to remember what the symbol stands for. In the second place, there are 26 letters in the alphabet as against 10 digits in the arabic system of notation. In practice, letters I, O, Q, and Z are usually omitted, because O, I, and Z are frequently taken for the numerals 0, 1, and 2, respectively, and the letter Q is difficult to make. If **lower case** as well as **capital letters** are used, there are 44 available characters under the mnemonic system. In designating factory operations, the addition of the small letter "g" is frequently employed to indicate words ending in "ing" thus, **"Bg"** would be for **boring** and **"Dg"** for **drilling.**

On the other hand, where tabulating devices are used, the mnemonic system is not advantageous, as these machines do not lend themselves to this system. The mnemonic system frequently requires the use of 6 or 7 letters to designate a function or operation or piece of machinery, and thus the use of a key is as necessary under this method as it is under the numeral system.

NUMERICAL SYSTEM.—The general ledger accounts are divided into nine fundamental groups, as follows:

1 Asset Accounts (other than investments and prepaid items)
2 Investments
3 Prepaid Items
4 Liabilities (other than accrued items)
5 Accrued Items
6 Valuation Reserves
7 Capital and Surplus
8 Income
9 Expense Accounts

Under this plan, these groups may be further subdivided into groups of nine. For example:

1 ASSET ACCOUNTS

11 Fixed Assets
- 111 LAND
  - 1111 Plant land actually used in operations
    - 11111 Details in subsidiary ledgers
  - 1112 Other land capital
    - 11121 Details in subsidiary ledgers
- 112 LAND IMPROVEMENTS
  - 1121 Improvements on plant land
    - 11211 Details in subsidiary ledgers
  - 1122 Improvements on other land capital
    - 11221 Details in subsidiary ledgers
- 113 BUILDINGS
  (Subdivided to suit the needs of the case)
- 114 MACHINERY

11 Fixed Assets *Continued*
- 115 TOOLS
- 116, 117, 118, 119 } Open numbers for further accounts as needed.

12 Current Assets
- 121 CASH IN BANK
  - 1211 First National Bank
  - 1212 Union Trust Company
- 122 PETTY CASH
- 123 NOTES RECEIVABLE
- 124 ACCOUNTS RECEIVABLE
- 125 INVENTORIES
  - 1251 Raw materials
  - 1252 Work in process
  - 1253 Goods in process
  - 1254 Finished goods
- 126, 127, 128, 129 } Open numbers for further expansion.

The foregoing serves to illustrate the method employed in designating the asset and liability accounts. The following illustrates the plan as it relates to expense accounts. Assume that account 93 is the control account for administration expense, and that account number 94 is the control account for selling expense. The control accounts appear in the general ledger while details appear in cost ledgers:

Administration Expense Accounts

		General Ledger	Cost Ledger Subdivisions
Administration Expense	**93**		
Administration Salaries		931	
Executive salaries			9311
Clerks' salaries			9312
Stenographers' salaries			9313
Bookkeepers' salaries			9314
General Administration Expense		932	
Stationery and office supplies			9321
Telephone and telegraph expense			9322
Postage			9323
Depreciation			9324
Insurance			9325
Taxes			9326
Life insurance premiums			9327
Executives' traveling expenses			9328
Directors' fees			9329
Donations			9330
Legal expense			9331
Pensions			9332
Subscriptions and dues			9333
Welfare work			9334

Selling Expense Accounts

		General Ledger	Cost Ledger Subdivisions
Selling Expense	**94**		
Selling Departmental Salaries		941	
Sales managers' and salesmen's salaries			9411
Salesmen's commissions			9412
Clerks' salaries			9413
Stenographers' salaries			9414
Advertising		942	
Traveling Expense		943	
Samples		944	
Stable and Garage and R. R. Siding and Equipment Expense		945	
Warehouse, Finished Stock		946	
Labor			9461
Materials			9462
Light, heat, and power			9463
Maintenance and repairs			9464
Depreciation			9465
Taxes on finished stock and warehouse			9466
Insurance on finished stock and warehouse			9467
Freight on Leather		947	
Miscellaneous Sales Expense		948	
Stationery and office supplies			9481
Telephone and telegraph expense			9482
Postage			9483
Depreciation			9484
Taxes			9485

	General Ledger	Cost Ledger Subdivisions
Insurance		9486
Light, heat, and power		9487
Welfare work		9488
Refinishing Expense	949	

COMBINATION OF LETTERS AND NUMBERS.—A combination of letters and numbers may be desirable. The following classification illustrates the principle employed under this system:

1 MANUFACTURING PLANT

Condensed Accounts	Subaccounts	Further Subdivisions
A. Land	a. Land	1 Land—purchase price 2 Land—grading and improvements
B. Buildings	a. Buildings	1 Buildings 2 Buildings—grading and filling
	b. Structures	1 Structures 2 Water, drainage and sewer pipes (outside) 3 Piping and electrical conductors (outside)
	c. Sprinkler System	
	d. Heating and Ventilating, and Other Inside Piping and Wiring	1 Heating and ventilating 2 Other inside piping and wiring
C. Machinery and Tools	a. Machinery	1 Machines 2 Electrical apparatus 3 Ovens and furnaces 4 Power plant and equipment
	b. Machinery Foundations and Installations	1 Foundation for machinery and apparatus 2 Installation of machinery
	c. Semi-durable Tools and Instruments	1 Semi-durable tools 2 Electrical equipment 3 Molds, jigs, punches, dies and special tools 4 Metal flasks
D. Patterns and Drawings	a. Patterns b. Drawings	
E. Furniture, Fixtures, and Appliances	a. Ship Fixtures and Equipment b. Furniture and Appliances in Factory Office c. Fire Protective Apparatus	
F. Other Equipment	a. Other Equipment	1 Railway tracks and overhead equipment 2 Rolling stock 3 Automobile and other conveyances
G. Unfinished Plant	a. Building b. Machinery and Tools c. Furniture, Fixtures, and Appliances	

MNEMONIC SYMBOLS IN STORES ACCOUNTING.—The mnemonic system is sometimes used in stores accounting, a special symbol being assigned to each kind of stores. This reduces the amount of writing required to make out requisitions. If the stores are arranged in the stockroom according to symbols, it makes for ease in locating them. In a large storeroom where the stores are of varying sizes, or of great variety, either the varying sizes of the stores require them to be arranged in other than the order indicated by the symbols, or their variety is such that their designation loses the mnemonic quality due to the number of letters required in consequence.

Note.—For additional data on symbolization and classification consult the Index for headings of such subjects discussed elsewhere, and, in particular, the sections on "Accounting Principles" and "Inventories."

Uniform Classifications

Classifications of accounts have been devised by the following groups of industries:

American Association of Flint and Lime Glass Manufacturers
American Bakers Association
American Boiler Manufacturers Association
American Drop Forging Institute
American Face Brick Association
American Foundrymen's Association
American Malleable Castings Association
American Photo Engravers Association
American Trade Spice Association
American Washing Machine Manufacturers Association
Associated Knit Underwear Manufacturers of America
Associated Wooden Ware Manufacturers
Atlantic Coast Shipbuilders Association
Biscuit and Cracker Manufacturers Association
Box Board Manufacturers Association
Bureau of Envelope Manufacturers of America
Casket Manufacturers Association of America
Central Bureau of Dining Table Manufacturers
Conveyor Machinery Manufacturers Association
Engravographia
Folding Box Manufacturers National Association
Grinding Wheel Manufacturers Association of United States and Canada
Institute of American Meat Packers
International Association of Electrotypers
International Stamp Manufacturers Association
Laundryowners National Association
Millwork Cost Information Bureau
National Association of Box Manufacturers
National Association of Brass Manufacturers
National Association of Chair Manufacturers
National Association of Corrugated and Fibre Box Manufacturers
National Association of Employing Lithographers
National Association of Farm Equipment Manufacturers
National Association of Hosiery and Underwear Manufacturers
National Association of Ice Industries
National Association of Stove Manufactures
National Association of Upholstered Furniture Manufacturers
National Bottle Manufacturers Association
National Coffee Roasters Association
National Commercial Fixtures Manufacturers Association
National Confectioners Association of the United States
National Council Lighting Fixtures Association
National Fertilizer Association
National Lime Association
National Machine Tool Builders Association
National Paper Box Manufacturers Association
National Pickle Packers Association
National Tent and Awning Manufacturers
National Veneer and Panel Manufacturers Association
News Print Service Bureau
Optical Manufacturers Association
Paint Manufacturers Association of the United States
Portland Cement Association
Power Piping Society
Prepared Roofing Association
Railway Car Manufacturers Association
Steel Barrel Manufacturers Association
Sterling Silverware Manufacturers Association
Tanners Council of the U. S. A.
United Typothetae Manufacturers Association
West Coast Lumbermen's Association
Wirebound Box Manufacturers Association

Public Utilities Classifications[1]

INVESTIGATION OF SENATE SELECT COMMITTEE.—In 1885 a Senate Select Committee was appointed to investigate interstate commerce in order to obtain information as a basis for interstate commerce legislation. Invitations were extended to all important organizations, corporations, and railroad commissions to express themselves. Circular letters containing 15 specific questions designed to obtain full knowledge of the opinions of the parties concerned were sent out. Hearings were subsequently held in many commercial centers throughout the country. Regarding accounting of public utilities doing interstate commerce, the following question was put: "Should corporations engaged in interstate commerce be required to adopt a uniform system of accounts?" Of 30 parties interrogated, 21 favored a uniform system, 7 thought it might not be necessary, and only 2 considered it unwise and burdensome.

INTERSTATE COMMERCE ACT.—This Act, passed in 1887, provided "that the commission is hereby authorized to require annual reports from all common carriers subject to the provisions of this act, to fix the time and prescribe the manner in which such reports shall be made, and to require from such carriers specific answers to all questions upon which the commission may need information . . . . and that said commission may, within its discretion, for the purposes of this act, prescribe (if in the opinion of the commission it is practicable to prescribe such uniformity and method of keeping accounts) a period of time within which all common carriers subject to the provisions of this act shall have, as near as may be, a uniform system of accounts, and the manner in which such accounts shall be kept."

INTRODUCTION OF UNIFORM SYSTEMS OF ACCOUNTS.—Shortly after passage of the Act, circulars were issued (October, 1887) to all carriers, state commissions, and interested parties, inviting them to public sessions of the commission which were held at Washington, and experimental blanks were distributed. Much assistance was given the Commission in the way of suggestions and constructive criticism by the American Railways Accounting Officers Association and the state commissions. In 1888 the first tentative form was submitted to corporations subject to the act, to which questions they were asked to reply. This was one of the first steps in bringing about uniformity of accounts of kindred corporations, and included the following questions:

1. History of company
2. Organization
3. Officers
4. Property operated
5. Capital stock
6. Funded debt
7. Floating and current liabilities
8. Permanent improvement for year
9. Cost of road and equipment
10. Income account
11. Income account (for roads under lease only)
12. Earnings from operation
13. Bonds owned
14. Stock owned—miscellaneous income
15. Operating expenses
16. Operating expenses (continued)
17. Rentals paid
18. General balance sheet
19. Financial operations for year
20. Important changes during year
21. Contracts, agreements, etc.
22. Security for funded debt
23. Employees and salaries
24. Passenger, train, and mileage
25. Freight, traffic movement (company's material excluded)
26. Description of equipment
27. Mileage of road operations (renewals of rails and ties)
28. Consumption of fuel by locomotive
29. Characteristics of road
30. Characteristics of road (continued)
31. Oath

[1] See also section on "Public Utilities."

At the convention of the state railway commissioners on Mar. 5, 6, and 7, 1888, at Washington, co-operation with the Interstate Commerce Commission was promised and a resolution was adopted at said convention to the effect that "it is the sense of this convention that a method of collecting and publishing statistics, both as to time and matter, should be adopted." A committee, consisting of seven members, one each from five states, one interstate commerce representative, and the president of the Association of American Railways Accounting Officers, was appointed to revise forms of reports.

The second step in unifying the system of accounting was brought about through the co-operation and suggestions of the Association of American Railways Accounting Officers. A subcommittee appointed by them to revise forms reported advisable certain changes, stating "that if these changes are adopted by the commission very many roads will be induced to adapt their accounts to that of the Interstate Commerce Form."

AMENDMENT OF ACT.—The Interstate Commerce Commission, after a few years of practical application of the law, soon found that the 20th section, dealing with reports and accounts, had to be made more drastic and penalties provided for transgressions. Recommendations were repeatedly made to Congress by the Commission to amend that part of the Act in such way as to make its enforcement possible. A Bureau of Statistics and Accounts, to supervise the public utilities more closely and to bring about more easily a uniform system of accounts, was proposed.

On June 29, 1906, the "Act to Regulate Interstate Commerce" was amended to grant ample authority to prescribe a uniform system of accounts for railways and for other common carriers subject to the Act. It provided that "in case of failure or refusal on the part of any such carrier, receiver, or trustee to keep such accounts, records, and memoranda on the books and in the manner prescribed by the commission, or to submit such accounts, records, and memoranda as are kept to the inspection of the commission or any of its authorized agents or examiners, such carrier, receiver, or trustee shall forfeit to the United States the sum of five hundred dollars for each such offense and for each and every day of continuance of such offense, such forfeitures to be recoverable in the same manner as other forfeitures provided for in this act." This enabled the Commission, first, to obtain accurate knowledge of intercorporate relations of the carriers and, secondly, to revise the various classifications of the operating expenses, and operating revenues, detailed accounting rates for which were issued June 3, 1907, as well as balance sheet items, effective July 1, 1908. The amended laws, further, placed "express companies, sleeping-car companies, pipe lines, and electric lines under the jurisdiction of the Commission so far as they are interstate in character."

BUREAU OF STATISTICS AND ACCOUNTS.—On July 10, 1907, the Commission issued an order prescribing a form of monthly reports of earnings and expenses. These reports were published beginning July, 1908, and furnished a good barometer of business conditions. The Bureau of Statistics and Accounts was established, with an organization of a Board of Examiners. On June 21, 1909, by order of the Commission, a revised classification of expenditures for additions and betterments and a form of general balance sheet were published. By the Act of June 18, 1910, telegraph, telephone, and cable companies, so far as they did interstate commerce, were placed under jurisdiction of the Commission. In 1912 classifications of accounts for steam roads were included, together with classifications of oper-

ating revenues and operating expenses, expenditure for road and equipment, for additions and betterments, classification of revenues and expenses for outside operations, of locomotive-miles, car-miles and train-miles; a form of general balance sheet and statement of income and profit and loss were also in preparation.

For electric railways and express companies a uniform classification of operating revenues and operating expenses, and a classification of expenditures for road and equipment was ready, and forms of a general balance sheet and statement of income and profit and loss were under consideration. For pipe lines, sleeping-car companies, telephone, telegraph companies, and carriers by water, orders for a uniform classification were issued May 31, 1910. The Commerce Court enjoined the order temporarily on October 5, 1911. On Apr. 1, 1912, however, the Supreme Court of the United States decided that ". . . . the uniform system of accounting prescribed and the report called for are such as it is within the power of the Commission to require under section 20."

After this decision of the Supreme Court, the Interstate Commerce Commission issued the classifications for carriers by water, effective Jan. 1, 1913, and July 1, 1913; for telephone companies, Jan. 1, 1913; and for telegraph companies, January, 1914. Further revisions of accounting classifications for steam railways, electric railways, and express companies were made effective July 1, 1914, the tendency of these revisions being in the direction of development rather than change in principle. The following table[2] shows progress made in bringing about uniformity of accounting for public utilities by issuing strict regulations for classification of accounts.

Steam Roads	Effective Date
Classification of Operating Revenues and Expenses	July 1, 1914
Classification of Operating Expenses Condensed	"
Classification of Investment in Road and Equipment	"
Classification of Train-miles, Locomotive-miles, and car-miles	"
Classification of Income, Profit and Loss, and General Balance Sheet	"
Interpretations of Accounting Classifications	"
Regulations to govern the Destruction of Records	July 1, 1915
Regulations to govern the Issuing and Recording of Passes	Jan. 1, 1912
Electric Railways	
Uniform System of Accounts	July 1, 1914
Interpretations of Accounting Classifications	July 1, 1915
Regulations to Govern the Destruction of Records	May 1, 1913
Carriers by Water	
Classification of Operating Expenses	Jan. 1, 1911
Classification of Operating Revenues	"
Form of General Balance Sheet	Jan. 1, 1913
Classification of Expenditures for Real Property and Equipment	"
Classification of Income, Profit and Loss Accounts	"
Regulations to govern the Destruction of Records	"

[2] Twenty-ninth Report of the Interstate Commerce Commission, 1915, Washington, Government Printing Office, 1915, p. 42.

	Effective Date
Express Companies	
Uniform System of Accounts	July 1, 1914
Interpretations of Accounting Classifications	July 1, 1910
Regulations to govern the Destruction of Records	July 1, 1915
It is the present intention to revise the interpretations of accounting classifications and also to publish regulations to govern the issuing and recording of franks.	
Pipe-Line Companies	
Classification of Investment in Pipe Lines, Pipe-Line Operating Revenues, and Pipe-Line Operating Expenses	Jan. 1, 1915
Regulations to govern the Destruction of Records	July 1, 1915
This system of accounts to be completed by the issuance of a classification of income, profit and loss, and general balance sheet accounts.	
Sleeping-Car Companies	
Classification of Revenues and Expenses of Sleeping-Car and Other Operations	July 1, 1912
Regulations to govern the Destruction of Records	Oct. 1, 1912
Telephone Companies	
Uniform System of Accounts (Classes A and B)	Jan. 1, 1913
Uniform System of Accounts (Class C)	Jan. 1, 1915
Regulations to govern the Destruction of Records	Feb. 1, 1914
Telegraph and Cable Companies	
Uniform System of Accounts	Jan. 1, 1914
Regulations to govern the Destruction of Records	Feb. 1, 1914

Until the year 1916, the annual reports, except for telephone companies and carriers by water, covered a period ending June 30. On Nov. 24, 1916, however, the Commission ordered the period changed to Dec. 31. In 1918 transportation carriers by the act passed Mar. 21, 1918, were temporarily put under Federal control with ample enlargement of accounting staff of the Commission. Federal Control was exercised over transportation carriers until Mar. 1, 1920, whence they were returned to private ownership with a certain income guaranteed by the government for six months; on Sept. 1, 1920, they finally were again privately operated, with no guaranty but with public regulation.

STATE REGULATION OF PUBLIC UTILITIES.—The State of New York supervised public utility corporations in a general way by legislative acts as early as 1855. It was not until 1907, however, that effective supervision over public utilities was exercised. "The Public Service Commission Law was originally enacted as chapter 429 of the laws of 1907, which became a law June 6, 1907, and took effect July 1, 1907. It was made Ch. 48 of the Consolidated Laws by Ch. 480 of the laws of 1910, in effect June 14, 1910." A uniform system of accounts was established by Art. III, Sec. 52, of the Public Service Law, which prescribed that "each commission may, whenever it deems advisable, establish a system of accounts to be used by railroad and street railway corporations or other common carriers which are subject to its supervision, or may classify the said corporations and other carriers and prescribe the manner in which such accounts should

be kept. . . . . The system of accounts established by the commission and the forms of accounts, records and memoranda prescribed by it as provided above shall conform in case of railroad corporations as nearly as may be to those from time to time established and prescribed by the Interstate Commerce Commission under the provisions of the act of Congress entitled 'An Act to Regulate Commerce approved Feb. 4, 1887, and the acts amendatory thereof or supplementary thereto. . . . . Where the commission has prescribed the form of accounts, records or memoranda to be kept by such corporations it shall be unlawful for them to keep any other accounts, records or memoranda than those prescribed or those prescribed by or under authority of the United States."

Comparison of I. C. C. Regulations with Those of P. S. C. of New York.—Accounts of railroad and street railway corporations are largely modeled after those of the Interstate Commerce Commission. A uniform system of accounts for such corporations was prescribed by the Public Service Commission, Second District, on Aug. 20, 1918, to go into effect after Jan. 1, 1919. In most cases where the classification of these accounts differs from those prescribed by the Interstate Commerce Commission, the differences are merely subdivisions of the latter. Corporations in New York subject to the Interstate Commerce Commission, must nevertheless (for the Public Service Commission of New York) set up subaccounts under each of the operating expense accounts listed in the groups "Way and Structures" and "Power," to cover any charges that may be made to operating expenses for retirement of losses (realized depreciation) not covered by reserves. In the classification of the Interstate Commerce Commission such losses are charged to the proper maintenance accounts in case of retirements of way and structures, and of power plant, buildings, and equipment; other equipment retired, however, is charged to the account "Equipment Retired." The state classification requires the above charges to be charged to accounts "Way and Structures Retired" and "Power Plant, Buildings, and Equipment Retired."

All commissions, however, whether federal or state, require of public utility corporations that definite provision should be made for **depreciation of fixed assets.** The practice is generally followed to keep the plant value at original cost and to set up reserves for depreciation sufficient to offset depreciation. Intangible assets are generally not recognized, unless actual payments have been made for the same. On the other hand, one instance may be cited in which the interpretation of accounts slightly differs. The expense "Discount on Bonds" in the classification of the Wisconsin Commission appears as a portion of property cost, whereas in the classification of the New York Commission it appears as an item of "Unamortized Debt Discount Expense."

Electrical and Gas Corporations.—Electrical corporations were ordered to establish a uniform system of accounts by the Public Service Commission of New York on Oct. 21, 1908, the order stating that "on and after Jan. 1, 1909, every electrical corporation shall keep upon its books the accounts prescribed . . . . so far as the said accounts are pertinent to the facts and circumstances of said corporations." A pamphlet containing operating revenue and operating expense accounts and balance sheet accounts, with information and instructions, was issued as of Oct. 21, 1908, and copies forwarded to all such corporations.

On Dec. 16, 1908, the Public Service Commission of New York ordered all gas corporations to keep their accounts in form prescribed by the Com-

mission. The general scheme of accounts issued was similar to that of the electrical companies and pamphlets with full classification and information were sent to such gas corporations.

Telephone Companies.—The laws of the State of New York (Ch. 673, of the Laws of 1910, Sec. 95, p. 2) provide that "the commission may establish a system of accounts to be used by telegraph corporations and telephone corporations, which are subject to its jurisdiction, and are required to make annual reports to it or classify the said corporations, and prescribe a system of accounts for each class and may prescribe the manner in which such accounts shall be kept." On Nov. 13, 1911, the Public Service Commission ordered that a uniform system of accounts be adopted such as prescribed by the Commission, and that a copy of such uniform system of accounts for telephone corporations be sent to every such corporation in this state. The telephone companies were further required to keep their accounts in conformity with these orders and printed instructions not later than and after Jan. 1, 1912.

Massachusetts.—Public utility corporations in Massachusetts have been under control of that state since 1857 and specific legislation has been enacted affecting the system of accounts of certain public utility corporations.

Railroad and Street Railways.—Acts of 1876, Massachusetts (Ch. 185 Sec. 1), provided that "the board of railroad commissioners shall before the first day of September, 1876, prescribe a system upon which the books and accounts of corporations operating railroads, or street railways, shall be kept in a uniform manner." With respect to forms of annual returns and changes in such returns, the Acts of 1906 (Ch. 463, Sec. 20) provide that "the board shall prescribe the form for the annual returns to be made by railroad corporations and street railway companies may, from time to time, make changes and additions in such forms, and shall give to the corporations and companies one year's notice of any changes or additions which require an alteration in the method or form of keeping their accounts." The Acts of 1913 (Ch. 784, Sec. 12) specify that "the commission may from time to time establish and prescribe a system of forms of accounts to be used by the common carriers subject to its supervision, or may classify the said common carriers and prescribe a system of forms of accounts for each class. The accounts of all such common carriers shall be kept in accordance with the forms prescribed. The commission may also in its discretion prescribe the forms of records and memoranda to be kept by such common carriers. The forms of accounts established by the commission and the forms of records and memoranda prescribed by it shall conform as nearly as may be to the similar forms from time to time established and prescribed by the interstate commerce commission." For the above utilities the annual reports and classification of accounts are the same as prescribed by the Interstate Commerce Commission.

Gas and Electric Companies.—For gas and electric companies, acts governing accounts were passed in Massachusetts in 1886 and 1887, respectively. The Acts of 1886 (Ch. 346, Sec. 2) provide that "Commencing on the first day of July in the year 1886 every company engaged in the manufacture and sale of gas shall keep its books and accounts in a form to be prescribed by the board of gas commissioners." In 1887 (Ch. 382, Sec. 2, of the Acts of 1887) the foregoing provision for gas companies was extended to include electric light companies. By legislative measure (Ch. 164 of the General Laws, Sec. 83) it was further enacted that "gas and electric companies and manufacturing companies and persons engaged in the manufac-

ture and sale or distribution and sale of gas or electricity shall annually, on or before such date as the department fixes, make to the department, in a form prescribed by it, a return for the year ending on such date as the department may from time to time require, signed and sworn to by the president and treasurer and a majority of the directors, of the amount of their authorized capital, their indebtedness and financial condition, on the said date, their income and expenses during the preceding year, their dividends paid and declared, a list of the names of all their salaried officers and the amount of the salary paid to each, and the balance sheet of their accounts as of said date."

SECTION 10

VALUATION

CONTENTS

SECTION 10

VALUATION

PURPOSES OF VALUATIONS.—Valuation principles apply to all balance sheets, but aside from the process of interpretation of balance sheet items for routine purposes, valuations are made for the following purposes:

1. Rate regulation of public utilities.
2. Purchase and sale.
3. Adjustment of fire losses.
4. Liquidation, as in bankruptcy and voluntary dissolutions.
5. Taxation.

VALUE.—The term "value" is interpreted in many ways. The director of the Valuation Bureau of the Interstate Commerce Commission states that to arrive at "fair value" it is necessary to marshal every fact obtainable with respect to the present condition and the past history of our railways. The concept "value" is usually qualified by the addition of a descriptive term, as "fair value," "service value," "exchange value," "going value," "market value," "physical value," etc. By value economists usually mean "exchange value," but no single abstract concept can ordinarily be applied to the practical problems with which the accountant deals. In a rate case Chairman Stevens of the New York Public Service Commission, Second District, states that value in exchange is not the proper basis in a rate case because it depends upon the rate. "To base the rate upon the exchange value would be generally merely to continue the rate, and it would absolutely continue it so far as the value is dependent upon the rate. If the change in rate affects the net income, it changes the exchange value; and if there be no change in exchange value there can be no change in rate."

Kester enumerates the following kinds of value:

1. Cost value.
2. Market value.
3. Sales price value.
4. Reproduction cost value.
5. Scrap, salvage, junk, or break-up value.
6. Service value.
7. Present or depreciated value.
8. Tangible or physical value.
9. Intangible value.
10. Earning value or earnings—capitalized value.
11. Liquidation or forced-sale value.

RELATION OF VALUATION TO ACCOUNTING.—The apparently exact results secured by double-entry methods are modified to a greater or less extent by the **valuation factor.** In any valuation there is always an element of error present, that is, a valuation is merely an estimate, and actual value, in many

instances, is what the assets turn out to be worth as factors in production of salable products, which is difficult or impossible to forecast. However, as long as valuations are carried out on uniform principles, the results are not affected so far as value for comparative purposes is concerned. It is for this reason that in some cases it is desirable to avoid current market fluctuations in making valuations. E. G. Prettyman,[1] writing on farm accounting, describes these bases as follows:

> There are **two systems of valuations** either of which can legitimately be followed. The first, and, in my opinion, the wisest method is that of keeping the value of all crops and stock at a **uniform level** which would usually represent their cost or value when the farmer entered, and which would, in most cases, be what is now known as pre-war value. So long as the valuation is uniformly maintained at this level, any sales at a higher or lower figure afford an accurate comparison from which profit or loss can be deduced, either for the farmer's own information or for income tax purposes. Also any profit or loss arrived at in this way practically coincides with the actual cash profit or loss, as a result of which income tax only becomes payable when there is actual profit, and when there is an actual loss a rebate is obtained.
>
> The **other system** is equally correct and perhaps more orthodox in principle, but is not, in my opinion, so satisfactory. It is to prepare the valuation annually according to the prices ruling at the moment. A valuation so made is liable to the errors referred to above, although the first of them is reduced to a minimum; but, for the reasons given, I am of opinion that this advantage in no way compensates for the loss of uniformity. A valuation prepared on this basis brings into account for income tax purposes any increase or decrease in the value of stock and crops, including those which are not sold but remain permanently or are consumed on the farm. This tends to inflate profits at a time of rising prices and to accentuate losses when prices are falling; these profits or losses may never materialize, although they would become a reality in any accounting year during which the farmer quitted his holding, but this does not affect the argument, as the subjects valued would then be converted into actual cash and would be accounted for accordingly.

VALUE vs. COST.—Some writers see a close relation between cost and value, but in valuations for rate purposes other considerations than cost are involved. As a result, various **valuation theories** have been evolved. No court assumes that cost as shown by cost of property account in the balance sheet represents fair present value or even money actually invested. Abandonments, improvements, consolidation, and reorganizations, issue of securities at other than par value, and so on, make such an assumption untenable.

In general, the various valuation theories which have been evolved represent modifications of the original cost theory and the cost of reproduction new theory. Owing to recent price tendencies, the former is favorable to the public, the latter to the utilities. As a result, the earlier tendency to emphasize original cost has been displaced by a tendency to emphasize cost of reproduction, due weight being given to local circumstances.

VALUATION AFFECTED BY PURPOSE.—It is generally conceded that the method of treating **intangible elements** in valuations should vary with the purpose of the valuation. A valuation for rate-making or sale may be higher than one for purposes of security issue or taxation. Sometimes the cost of physical property should be excluded in making valuations for taxation, because such cost is in itself a form of tax. Paving is an illustration. **Donated property** may be included for purchase or taxation, but be excluded in fixing rates. Sometimes items are included to which a company does not possess a legal title, as where pavement and piping are altered when a railroad is constructed through a city.

Valuation of Utilities

VALUATION FOR TAXATION vs. VALUATION FOR RATES.—Commissioner Wood, of the Indiana Railroad Commission, says:

With reference to taxation values in the State of Indiana, we hold that this is not the value upon which the carriers can claim a rate. We hold that they are entitled to earn and pay to the State whatever assessment is made against them, no matter on what method the assessment may be made, and that the amount paid must be allowed to them just as the cost of operation is allowed to them, but on the other hand, the taxation value is not the value upon which to base the rate, but the rate must be based upon the amount which they have invested, and not otherwise.[2]

Some cases hold value for rate purposes and value for condemnation or purchase to be the same. In one case[3] it was said:

It is true that this was a condemnation proceeding, and the question was to determine what was just compensation for the appropriation of corporate property to a public use, while the case before this court relates to the fixing of water rates which shall be a just compensation for the appropriation of complainant's property to a public use. It is not perceived that there is any difference in the principles applicable to the two cases, and this appears to have been the view of the Supreme Court in *San Diego Water Co.* v. *San Diego*.[4]

VALUATION FOR RATES AND PURCHASE vs. VALUATION FOR CAPITALIZATION.—A close relation may exist between value for rates and for purchase on the one hand, and value for capitalization on the other. This is true when valuation for rates and purchase is based on cost. If valuation for rates or purchase is based on reproduction cost, there is little similarity between them. As nearly as possible, cost and value for purposes of capitalization should correspond.

VALUATION FOR RATES vs. VALUATION FOR PURCHASE.—In *Fuhrmann* v. *Cataract Power & Conduit Co.*,[5] it was stated that the difference between value for rates and value for purchase is that in the former case the question is how much has been put into the property; in the latter, how much can be gotten out of it.

In *Public Service Gas Co.* v. *Board of Public Utility Commissioners*,[6] Judge Swayze says:

The two bases of valuation may properly be different, since upon a sale or condemnation the probability of an assured income and a continuance of the existing rates enters into and affects the exchange value; while in the case of a valuation for the purpose of fixing a rate, the question is what valuation and rate will tempt the investment of capital, and to what extent existing rates may with justice be lowered.

VALUATION FOR RATES vs. VALUATION FOR TAXATION.—That these are not the same is the contention of the Supreme Court of the United States in the *Missouri Rate Cases*.[7] The New Hampshire Public Service Commission agrees:

. . . for the reason that, in making assessments for purposes of taxation, elements may properly be taken into consideration which are entitled to no weight in fixing a valuation for rate purposes. For example, under the decision of the Supreme Court of New Hampshire in the case of *Fitchburg R. R.* v. *Prescott*,[8] it is held that the franchise

of a corporation should be included in an assessment for the purposes of taxation. A franchise is a grant from the public, and it would seem clear that it ought not to be made the basis of charges against the public.

It has been said that "Value is meaningless unless made with reference to some particular object."

G. F. Swain, in his report to the Massachusetts joint board on validation of assets of New York, New Haven & Hartford Railroad Co., says:

The treatment of depreciation, and of abandoned property in particular, should reasonably differ according to the purpose of the appraisal . . .

If the object is to justify existing capital, or to serve as a basis for the issue of new securities, or to fix rates of service, it seems reasonably clear, however, that depreciation should not be allowed for.

There is no inherent inconsistency in using one method of valuation for tax purposes and another method for rate purposes. . . . Methods of ad valorem taxation must be worked out with an eye single to what is just and practicable in taxation, and methods of valuation for rate purposes must be worked out with an eye single to what is just and constitutional in rate-making.

The above quotations represent the **best thought** on the subject.

VALUATIONS FOR RATE-MAKING.—This is the basis of governmental regulation of utility companies. The question of rate regulation first came before the United States Supreme Court in the *Granger Cases* in 1876.[9] Acts regulating rates were upheld on ground that property was affected with a public interest, that regulation of rates was a legislative function, and that the courts were powerless to prevent abuse of this function by the legislature. This doctrine was soon modified and later abandoned. In 1886, Chief Justice Waite said:[10] "It is not inferred that this power of limitation or regulation is itself without limit. This power to regulate is not a power to destroy, and limitation is not the equivalent of confiscation." Yet in 1888, Justice Gray said:[11] "The court has no means, if it would under circumstances have the power, of determining that the rate of 3 cents a mile fixed by the legislature is unreasonable." However, in 1890 the Supreme Court held[12] that it necessarily rests within the jurisdiction of courts to determine the legality of a rate fixed by a legislature or by a commission. In 1898 it was definitely decided[13] that a "fair return" on "fair value" of property used in public service is the **chief basis** for determining reasonableness and constitutionality of rates charged.

In *Smyth* v. *Ames*, the United States Supreme Court enumerated six things[14] to be considered in determining **fair value.** Among these were: "original cost of construction," "present as compared with original cost of construction," and "sum required to meet operating expenses." It was suggested that other than the six factors enumerated might require consideration.

VALUATIONS FOR CAPITALIZATION.—Until recently, but little supervision was exercised over issuance of securities by public service corporations. As a result there have been instances of inflation and stock-watering. Investors have been at a loss to know what was the real equity behind their holdings. **Control of security issues** is an outgrowth of rate control.

Certain principles governing security issues have been developed. In general,

public utilities are not permitted to issue securities to obtain funds to construct facilities not needed or which duplicate facilities already in use. If a sale of securities is needed, the discount, if any, at which they are sold and the manner in which funds secured from their sale are to be expended are prescribed.

Valuations for capitalization and issuance of securities are closely related to the problems of depreciation and obsolescence. If public service commissions are to have adequate control over security issues, they must also have control over depreciation rates and the policy regarding obsolescence and inadequacy.

The Public Service Commission of New York, First District, ordered the New York Railways Co. to reserve 20% of its operating revenues for maintenance and to reserve for depreciation what was not required for repairs and current upkeep. Its predecessor, the Metropolitan Street Railway Co., collapsed largely because of failure to maintain property out of earnings. Renewals had been financed successively through bond issues which were so pyramided that they placed a great and disproportionate burden of fixed charges upon the company. The New York Court of Appeals reversed the decision of the lower court on grounds not of unreasonableness but because the law did not expressly grant to the Public Service Commission the control of financial policies of utilities. The natural solution of the problem is legislation which grants rate-determining power to the commissions. For a detailed discussion of valuations for capitalization, see Chs. XVIII-XX of Saliers' "Depreciation, Principles and Applications."

VALUATIONS FOR TAXATION.—Rules governing tax valuations depend upon tax laws. Fundamentally, such a valuation must be a valuation of **real estate,** a capitalization of **net earnings** which is equivalent to a going-concern valuation, or else a **franchise valuation** made to determine the amount of a franchise tax.

It is often admitted that tax values of physical property ought to be placed below capitalization values, to prevent overtaxation of tangible property. In St. Paul it was shown that tax values were about 60% of normal selling prices.

In 1900, in Michigan a valuation of railroads was made for taxation purposes. Reliance was placed upon estimates of appraisers and real estate experts. To cover special value of railroad lands, an increment was added to the results secured by the experts. Practice of applying **multiples** to railroad property has since been followed frequently. In 1911, New Jersey made a valuation of railroads for tax purposes, reliance being placed largely upon assessed values of adjoining lands. An amount of 7% was added to represent administrative cost and interest, but in making its final estimate of right-of-way values, the state board doubled the values determined by the expert.

VALUATIONS FOR PURCHASE.—A utility property may be sold to a city or to another corporation. A valuation to determine purchase price may be necessary. Sometimes utilities operate under franchises providing for sale to the municipality at expiration of a given period and under terms requiring a valuation of plant. Sometimes the franchise is an item in a valuation and in such cases its cost only is an allowable item.

Commissions and courts have tried to evolve principles governing such valuations. Thus Wisconsin Railroad Commission usually includes value of pavement over mains, although excluding it for rate purposes. The Supreme Judicial Court of Maine, in a municipal purchase case, says that "a fair rate—usually the prevailing rate—of interest upon the money invested in the plant during construction, and before completion, is as much a part of the cost of construction as is the money itself which is expended for materials and labor."

Bases of Valuation of Utilities

Certain more or less well-defined bases of valuation for rate-making, taxation, purchase, and capitalization have been established. So far as they relate to the valuation of public utilities, they may be said to have been formulated to protect property under the federal constitution.

ACTUAL COST.—This will be considered as a basis of valuations for rate-making, capitalization, taxation, and purchase.

1. **Rate-making.**—The term may mean total cost to date regardless of whether all units purchased are in existence today, or it may mean merely original cost of existing units. Its use requires correct distinction between capital and income. If accounting records were kept without error, **book value** would indicate actual cost; but usually book value is not a dependable guide. Frequently the discrepancy between cost and value is so great that actual cost does not greatly influence valuations. Until recently, in public utility valuations, the tendency has been to include in **fair value** accretions arising from natural community growth, as well as those received in form of donations. **Land** gives rise to large discrepancies between cost and value where value means present market value or replacement value. In 1900, real estate of the Illinois Central, book value $200,000, was valued at $34,000,000. In 1894, the United States Supreme Court found actual cost greater than reproduction cost, but held that this "actual investment . . . . is not to be ignored, even though such sum is far in excess of the present value."[15] **Actual cost** was strongly upheld in *San Diego Water Co.* v. *City of San Diego*.[16] The Wisconsin Railroad Commission holds no single standard, but always considers actual cost data when available. In 1910 it said: "For rate-making purposes the actual total investment in the enterprise, subject to certain qualifications, seems to be the basis for determining the reasonableness of the charges that may be exacted of the public."

The New York law requires the commission, in fixing charges on gas and electricity, to "give due regard among other things, to a reasonable average return upon capital actually expended." The Interstate Commerce Commission, in *Advances in Rates* (western) *Case*, 1911,[17] said that the nearest approximation to a fair standard is "bona fida investment." The New Hampshire Public Service Commission says that "a rule equitable alike to investors and the public would seem to be that property dedicated to the public use shall neither increase nor decrease by reason of any change in its cost of reproduction, but shall continue to earn a full return upon the amount honestly invested therein." But in the *Minnesota Rate Cases*, Justice Hughes said:[18] "It is clear that in ascertaining the present value we are not limited to the consideration of the amount of the actual investment," and, "The property is held in private ownership and it is that property, and not the original cost of it."

Depreciation reserves are almost invariably set up on a cost basis. They represent withholding of replacement funds from income before they are required to make replacements. If these are invested in extensions and betterments, **Property account** is increased, also its earning capacity.

Federal courts have decided that where properties are unable to set up reserves to amortize cost of worn out equipment, they may retain it in "fair value" until increased earnings permit writing it off. The Interstate Commerce Commission has followed this practice. Practice of state commissions is

[15] 64 Fed. 165.

[17] 20 I. C. C. R. 307.
[18] 230 U. S. 352.

not uniform. The best reasoned decisions of state commissions permit inclusion of unearned depreciation in fair value. The Wisconsin Commission usually includes unearned depreciation and other losses in determining fair value, so long as result secured does not exceed cost of reproduction of property. Since so many companies have been unable to earn depreciation, this amounts to the adoption of a standard of valuation which does not deduct depreciation to determine fair value. Since **depreciated value** of well-financed utilities is from 75% to 85% of cost of reproduction, significance of above from point of view of constitutional prohibition of confiscation of property is evident.

2. Capitalization.—Massachusetts first undertook systematic control of security issues of public service corporations. In general it has followed the policy of permitting issuance of stock of public service corporations for cash only and not below par. In connection with security issues commissions frequently find it necessary to value existing properties. The logical procedure is to determine values for capitalization, then base rates on those values. In such a plan **depreciation** must be considered, both in the original valuation when values are fixed as a starting point for future operations and as a continuing circumstance after such valuation has been made. In case of long-established companies difficulties in way of making actual cost the basis for capitalization are same as those in the way of making it a basis for rates.

Approval of a security issue is not necessarily a guaranty of fair return.

In the *Metropolitan Reorganization Case*[19] the valuation was for capitalization purposes. Folly of retaining obsolete or obsolescent property at original cost was shown. Within 20 years many miles of track had fallen into disuse. Obsolescence was illustrated in the inefficient horse-car service. Failure to provide for future replacement of existing equipment necessitated the issue of new securities for purchase of electric equipment, thus resulting in overcapitalization. The commission held that securities for property now non-existent should be amortized.

3. Taxation.—Basis of valuation for tax purposes depends on tax laws. Usually actual cost is not the basis. Franchises are usually valued by the **net earnings rule.**

4. Purchase.—Usually actual cost is not the controlling factor in a valuation for public purchase. Depreciation is usually considered, but it is deducted from cost of reproduction, not from cost. Where franchise or going concern value is considered and is determined on basis of earnings, actual cost basis is necessarily abandoned.

REPRODUCTION COST.—This is cost of reproducing a property new on basis of current prices. It is usually customary to average prices over a period, say 5 years, preceding date of valuation. The plant is usually assumed to be reconstructed from materials and equipment in every respect the same as used in construction of the actual plant. But sometimes a substitute plant of equal capacity is assumed. Either present or original conditions may be assumed. Ordinarily it is fairest to assume reproduction under conditions actually existing at time plant was constructed. Reproduction cost may be either greater or less than actual cost, depending on price tendencies and skill used in erecting existing plant. Difficulties of applying the reproduction cost method have been expressed by the United States Supreme Court as follows:[20]

Moreover, it is manifest that an attempt to estimate what would be the actual cost of acquiring the right of way if the railroad were not there is to indulge in mere speculation. The railroad has long been established; to it have been linked the activities of

[19] P. S. C. R. (1st Dist. N. Y.), Case No. 1305.
[20] 184 Fed. 765.

agriculture, industry and trade. Communities have long been dependent upon its service, and their growth and development have been conditioned upon the facilities it has provided. The uses of property in the community which it serves are to a large degree determined by it. The values of property along its line largely depend upon its existence. It is an integral part of the commercial life. The assumption of its non-existence, and at the same time that the values that rest upon it remain unchanged, is impossible and cannot be entertained.

In many cases it is impossible to secure satisfactory estimates from experienced engineers. In many instances depreciated condition of properties makes it necessary, in arriving at present or fair value, to make deductions from reproduction cost for depreciation, so that reproduction cost less depreciation is a corollary proposition. Commissioner Thelen of the California Commission says: "Cost of reproduction of a property is to be considered merely because it serves as an indication of what has been invested in the property, and not what the property is worth, as worth is generally understood."

1. Rate-making.—The field is divided into two groups of advocates: (a) those who make reproduction cost the basis of valuation, and (b) those who make reproduction cost less depreciation the basis.

Reproduction cost less depreciation has been upheld by the following:

Oklahoma Supreme Court *In Re Pioneer Telephone & Telegraph Co.* v. *Westenhaver* (Jan. 10, 1911).

New York Public Service Commission, First District, *In Re Metropolitan Street Railway Reorganization* (Feb. 27, 1912).

The Supreme Court of the United States in *Knoxville* v. *Water Co.* (212 U. S. 1).

R. H. Whitten, in "Valuation of Public Service Corporations" (1912), Vol. I, p. 359.

Special Committee of American Society of Civil Engineers in tentative report, "Valuation for Purpose of Rate-Making."

The opposite side has been defended by A. C. Humphreys in "Proceedings of American Gas Institute," Vol. VIII, Part II, p. 521.

Reproduction cost taken in connection with depreciation has been the most important single factor in valuations for rates. Earlier tendency to make it outweigh all the other factors has been toned down. It was rejected by the United States Supreme Court in the *Missouri Rate Cases*, also by the California Commission as a means of throwing light on investment in property. In the *Chicago Gas Case* (1911),[21] cost of reproduction new was approved on the ground that the "company in this case has charged operating expenses annually with an amount which is deemed sufficient to offset the depreciation." It was approved by the Wisconsin Commission in *City of Whitewater* v. *Whitewater Electric Light Co.*[22] "since although the investment may apparently be diminished by failure to provide for depreciation and by the payment of this money to owners or stockholders, in reality the investment is not diminished, because of the necessity of replacing the plant, in the absence of a depreciation fund, from the property of owners or stockholders." In *Hill* v. *Antigo Water Co.*, the Commission stated that it might under certain conditions deduct depreciation from cost of reproduction, and explained that this might be done where a company has had rates ample to cover all operating expenses, including depreciation, and to afford also a fair amount for interest and profits but where the amount collected for depreciation has been distributed to stockholders.

The rule employed in the majority of rate cases has been reproduction cost

[21] R. H. Whitten, Valuation of Public Service Corporations, Vol. I, p. 365.
[22] 6 W. R. C. R. 132, 138 (Dec. 16, 1910).

less depreciation, but it has been simply a plan of procedure subject to constant modification and, sometimes, to rejection.

Since a deduction from cost of reproduction to cover depreciation is important, it is necessary to determine what such deduction shall cover. In tentative valuation of Texas Midland Railroad by Interstate Commerce Commission, cost of reproduction was found to be $3,627,313, and depreciation deduction $854,584, or 23.5% of reproduction cost. In tentative valuation of Atlanta, Birmingham & Atlantic Railroad, cost of reproduction was found to be $26,446,-411, and depreciation deduction $13,746,188, or nearly 52% of reproduction cost. In tentative valuation of Kansas City Southern figures were: reproduction cost $47,015,814, depreciation deducted $7,148,722, or slightly over 15% of reproduction cost. In one case the New Jersey Commission deducted 6.6% for physical depreciation only. In the Texas Midland valuation, the Interstate Commerce Commission allowed 50% of replacement cost for ties. No reduction was made for engineering and grading. For most items a normal service life was assumed and they were then depreciated on basis of expired life.

2. Capitalization.—Capitalization value is usually equivalent to cost; consequently cost of reproduction is not usually regarded as a proper base to determine capitalization value. Capitalization is an accounting problem and usually refers to cost. It is a measure of proprietorship, not of value.

3. Taxation.—In 1900-1901, Professor M. E. Cooley appraised the Michigan railroads for tax purposes. Reproduction cost less depreciation was used but overhead was not depreciated, except that allowance for contingencies was reduced about 18%. Ohio, Wisconsin, South Dakota, and New Jersey have made physical valuations of railroad property, present value being determined by deducting depreciation from cost of duplication. E. M. Bassett, ex-Commissioner of Public Service Commission of New Jersey, First District, says:

"If it is decided that a public utility should be taxed on its total value as a going concern—that is, its commercial, market or sale value—then franchise and going value will be included. If, on the other hand, the public utility plant is to be taxed precisely as other real estate, the cost of reproduction less depreciation will be the basis."

A study of assessed valuation, cost of reproduction new, and par values of stocks and bonds made of Wisconsin railroads showed that in some cases cost of reproduction new was two or more times as great as assessed valuation, as determined by estimate by the State Tax Commission. In other instances the Commission's estimate of value fell below cost of reproduction new.

4. Purchase.—The reproduction cost basis has been used in modified forms in valuations for public purchase. Valuation for public purchase is in many respects analogous to valuation for rates, being based on the same **constitutional principle,** viz., that private property should not be confiscated. Whereas in valuations for rates there are two primary factors, **value** and **rate,** in valuation for purchase there is but one, **value.** Certain items may be included in a purchase valuation which should be excluded in a rate valuation. The Wisconsin Commission usually includes value of pavement over mains in purchase valuations but excludes it in rate valuations. The Wisconsin Supreme Court says that in arriving at cost of reproduction for purposes of public purchase, such cost shall be considered as "would be necessarily incurred by a reasonably prudent and careful man, using ordinary careful business methods, in reproducing a plant of equal efficiency."

Interest during construction is usually included in both rate and purchase valuations In laying down rules for an appraisal for municipal purchase, the Supreme Judicial Court of Maine included "a fair rate—usually the prevailing

rate—of interest upon the money invested in the plant during construction, and before completion" as a part of cost.

In *National Telephone Co., Ltd.*, v. *His Majesty's Postmaster-General* (1913),[23] the basis was nearly equivalent to reproduction cost of physical property less depreciation. A **fundamental cost** was agreed upon which corresponded to cost of reproduction less depreciation, except that it included casualty insurance, an item of small importance in the aggregate.

In appraisal of Gloucester Water Supply Co. (1899-1901), cost of duplication less depreciation was basis of valuation, but an allowance was made for going concern of 13% of total.

MARKET VALUE.—Market value plays an important part in tax valuations. In rate valuations it is often rejected because market value depends on rates. Market value disregards money invested. It has been recognized as a factor in valuations by the United States Supreme Court. It has been made the basis of railroad valuation by the Washington Railroad Commission.

1. **Rate-making.**—Market value is sometimes an important factor in determining reproduction cost, because reproduction costs are usually assumed to be what market values of land and materials are at time cost of reproduction is determined, or what they average over a period of years. Sometimes market value is assumed to be increased by a **multiple** because of the additional value given to it by its newly assumed use. For detailed consideration, see *Minnesota Rate Case*, 256 U. S. 352; also Saliers' "Depreciation, Principles and Applications," pp. 396–398.

The St. Louis Public Service Commission appraises land at present market value but employs actual or original cost in valuing equipment.

The Interstate Commerce Commission ascertains present value of land by multiplying number of acres of land owned or used by carrier for purposes as a common carrier by **present market value** per acre of "similar, adjacent and adjoining lands," due allowance being made for "peculiar adaptability of the land to railroad use." It rejects use of **multiples** to find "railway value," following the lead of the Supreme Court in *Minnesota Rate Cases*.

The Washington and California Commissions, reversing earlier practice, have rejected use of multiples.

In **land values** depreciation is not ordinarily a matter to be considered. Appreciation is more important. In determining it, courts and commissions tend to reject use of multiples and, in some instances, cost of reproduction as determined by valuations of adjoining lands.

In finding market value of **wasting assets** the depreciation problem is a question of facts. If depreciation has been earned and the reserve is intact, it ought to be deducted to arrive at value for rate purposes. If it has been earned and distributed to stockholders, it ought to be deducted; but if, under good management, the utility company has been unable to earn depreciation, it ought not to be deducted in ascertaining fair value.

2. **Capitalization.**—Capitalization is an accounting problem. Accounting proceeds from a cost basis. But there are departures from this general rule. Sometimes cost cannot be determined. Sometimes it is so far out of consonance with existing conditions that to adopt it is unjust.

The New Hampshire Commission says that the price obtained at a sale helps to determine fair present value for capitalization purposes.

The Michigan Commission holds that fair market value as represented by

[23] R. H. Whitten, Valuation of Public Service Corporations, Vol. II, pp. 1039–42.

initial cost plus certain developmental expenses is the proper basis of capitalization. In one case this was:

Original land cost	$ 500,000
Service in acquiring	500,000
Interest during purchase	150,000
Cost of promotion	300,000
Total	$1,450,000

In 1894 Texas made an appraisal to regulate security issues. Right of way and real estate were valued on basis of current market value of immediately adjoining territory.

When market value is made the basis of capitalization, the depreciation reserve, if earned, should be deducted from total market value. If, under good management, it has not been earned, it should not be deducted. If it has been earned but distributed, it should be deducted.

Where market value is determined, not on basis of earning power but on basis of cost, and allowance is made for depreciation, the reserve should not be deducted.

3. Taxation.—Market value has been an important factor in valuations for tax purposes. In Michigan an appraisal was made for tax purposes in 1900. **Multiples** were employed for the first time, being applied to values ascertained by experts. Percentage added varied from 100% to 300%, with an additional fixed charge of $3 to $8 per acre to cover costs of acquisition, etc. Results being unsatisfactory, another valuation was made in 1902. To determine actual costs of buying land, county records were studied and abstracts made of all transfers over a preceding period of 10 years, and average price paid per acre for various classes of land was computed. This was compared with transfers of improved and unimproved lands adjacent to railroads. The results showed that the earlier valuation undervalued real estate owned by railroads.

In 1903 the Wisconsin Commission made an appraisal for tax purposes. As added precaution the Commission applied to average transfer price per acre a percentage representing ratio of average assumed value of land in a given locality to average price paid for that land.

In Wisconsin railroads must pay true average rate of taxation on market value of property.[24] This is interpreted as being the amount that could be realized from sale of that property under normal conditions.

In 1911 New Jersey appraised railroads for tax purposes, placing reliance chiefly on market values of adjoining lands. An amount of 7% was added for incidental costs.

Sometimes market value is secured by capitalization of net earnings. In tax valuations it is more usual to base value on comparisons of sales of property located similarly to that being valued. Where **net earnings** method is followed, current depreciation is a factor because its deduction is necessary to a correct statement of profits.

4. Purchase.—Market value is not usually the chief factor in public purchase appraisals. To accept it as the basis would be to capitalize present earning capacity, which is based on rates, and may represent too great or too small a return on a fair valuation.

DEPRECIATION RESERVES IN VALUATIONS.—Most utility companies have not established depreciation reserves, going on the theory that repairs are equivalent to depreciation, or have set up inadequate reserves. A company

[24] Wisconsin Statutes, 1915, Ch. 51, 14.

should receive a fair return, not on depreciated value of original plant, but on its cost plus or minus any amount which various considerations may make equitable. A return ought not to be earned on the reserve because it offsets accrued depreciation which is not deducted in the balance sheet. The amount reserved is the property of the company returned through the rates to offset accrued depreciation on plant but which has not been deducted from cost. If accrued depreciation were deducted from plant in determining fair value, then, on the contrary, extensions financed out of depreciation reserves ought to be included in fair value.

Corollary considerations:

1. When revenues have been insufficient to afford a fair return and also establish depreciation reserves, so that no reserve has set up.
2. When revenues have been sufficient to afford a fair return and also establish depreciation reserves, but no reserve has been set up.
3. When the reserve is employed to amortize capital.

If, in (1), accrued but unearned depreciation is deducted in determining fair value, investment is depleted, because no offset to accrued depreciation exists in form of extensions, betterments, or investments, paid out of the reserve. The company has consumed capital to pay running expenses and no allowance is made for this in fixing fair value. If the depletion in capital results from mismanagement, the loss should not be capitalized; otherwise it should be included in fair value.

When, as in (2), depreciation has been earned but distributed, it should be deducted from cost in determining fair value. Not to deduct it is to permit the company to capitalize that which it has returned to its stockholders.

When, according to (3), the reserve is employed to amortize capital, depreciation should be deducted to determine fair value. The legitimate use of the reserve is to offset accrued depreciation. If used to amortize capital, equity of owners is reduced to that extent. They cannot expect to secure a return on what they originally invested, for allowance should be made for what has been returned to them.

Valuation of Commercial Plant

COST THE USUAL BASIS.—In most commercial balance sheets, values are shown as cost or as adjusted cost. The **primary evidence** of cost is the **purchase invoice,** but it is usually necessary to consider less definitely ascertainable elements also. Proper segregation of capital and revenue is a factor.

CAPITAL AND REVENUE.—Capital expenditures are those which should result in the increase of asset accounts, although they may result indirectly in the decrease of a liability. Revenue expenditures are those which should result in charges to expense accounts.

Capital receipts are funds received from sale of capital stock or fixed assets.

Capital expenses are those incurred in providing capital needs.

ORGANIZATION EXPENSES.—These are a group of capital expenditures incurred to place a concern on a going basis. As soon as enough revenue is accumulated to write them off, they should be considered as revenue expenditures. They constitute capital expenditures at time of incurrence because no other than capital funds are available.

MAINTENANCE.—After a concern begins to produce revenue, it is necessary to distinguish capital from revenue. The chief difficulty arises in connection

with repairs, renewals, replacements, and betterments. The dividing line between capital and revenue expenditures must sometimes be closely drawn. More or less arbitrary working rules are sometimes followed.

A. L. Dickinson defines repairs and renewals as follows:

Repairs.—This should include all current expenditures recurring from day to day and from month to month on the general upkeep of the existing property without the renewal of any substantial part thereof, and generally all periodic repairs which are necessarily undertaken within, say, one year.

(This caption will, of course, include certain renewals of small parts, etc., such as would be necessary to continue the useful life of any unit of building, plant, or machinery over the estimated period of its life.)

Renewals.—This should include all expenditures incurred in renewing, in whole or in part, any unit of building, plant, or machinery, which tends to extend its useful life beyond the average term. These expenditures would in general be those which would only occur at long intervals of two or three years, and whose effect would last for a number of years afterwards.

Replacement has been defined as "the act of replacing a plant unit which is going out of service, with a **substitute** which may be either identical with the unit replaced or different from it."

TREATMENT OF RENEWALS.—Adequate maintenance requires constant repairs and replacements. When a new part is substituted for an old one, the question of **betterment** arises. If the new costs more than book value of the old, a betterment results measured by the excess. **Renewal of machine parts** presents a more difficult question because the original cost of parts must be estimated, neither is its depreciated value exactly known. Certain **working rules** should be adopted. Kester suggests that only when renewal involves an expenditure of $5 or more should an attempt be made to determine the amount of betterment, every expenditure under $5 to be charged to expense. The Chicago Traction System makes $200 the minimum charge to capital or renewals, all lesser charges being made to income even though in reality capital expenditures.

Cost-cutting changes should be charged to capital or revenue, accordingly as they do or do not increase earning capacity. When such costs are capitalized they should be rapidly depreciated. The **best practice** is to handle items of this kind as **deferred charges** under suitable descriptive caption, instead of as charges to the asset account, where their nature is soon lost from view and the need of a high depreciation rate forgotten.

All assets subject to depreciation are in the nature of a deferred charge. "To meet this condition," says I. S. Eaton, "we arbitrarily designate certain expenditures whose effect infinitely outlasts the immediate earning period as 'capital,' and then in the same arbitrary way, through all subsequent vicissitudes, we hold them to their first value by maintenance, renewal, and depreciation charges which are borne by other expenses."

Separation of expenditures or basis of capital and revenue should be properly authorized, the authority taking the form of a **journal voucher.**

Construction costs sometimes properly involve capitalization of repairs, because all costs necessary to bring a plant to operating condition represent capital expenditure. Among these are: interest on borrowed money, engineering, supervision, legal expenses, taxes, and overhead.

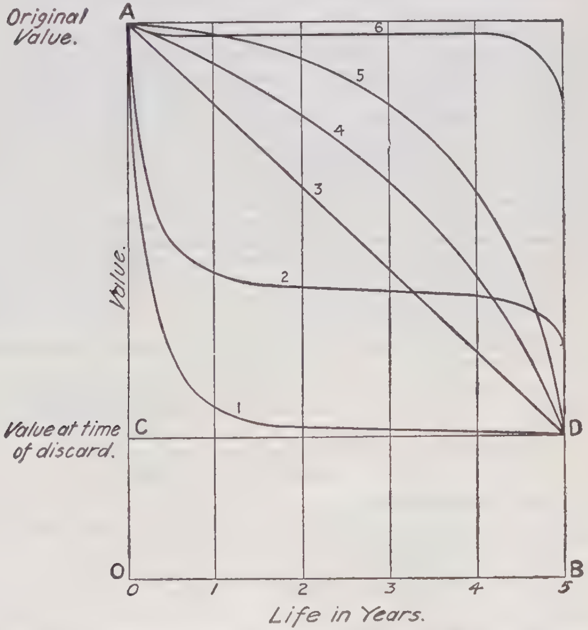
The correct application of the above principles leads to the exclusion from the asset side of the balance sheet of items which cannot be properly capitalized.

GROUPING OF ASSETS FOR VALUATION PURPOSES.—For this purpose Kester lists assets as current, deferred charges to operation, and fixed, and says, in effect:

1. **Current assets** should be valued on basis of cost or market, whichever is lower. Speedy realization of current assets by conversion into cash is the aim; cost, if lower than market, should be the valuation base.

2. In case of **deferred charges to operation**, the principle is simply the equitable proration between periods on going concern basis.

3. **Fixed assets** should ordinarily be valued on basis of cost less depreciation. Market values have no effect, because to a going concern they are worth cost less proportion thereof used up.



FORM 1. Chart Showing Actual and Theoretical Depreciation

Valuation is not an **exact science**, consequently balance sheets are to a certain extent **expressions of opinion.** In balance sheets, content is more important than form. Consequently the need of using care in applying valuation principles is great.

PROBLEM OF DEPRECIATION IN VALUATION.—The depreciation problem arises in connection with valuations through the necessity of distinguishing capital and revenue. The correctness of both income statement and balance sheet are involved. It is necessary to distinguish between depreciation principles as applied to conservation of investment and as applied to determining valuation for current purposes. Preservation of investment is secured, for practical purposes, if original cost of an asset is returned through revenues during its life, but since various schemes of charging off depreciation

require its writing off at different rates at given periods in the life of an asset, the amount reserved at a given time depends upon the method employed to ascertain the charge. In any case, the amount established by an arbitrary method is **theoretical depreciation,** whereas **actual depreciation** is that established by actual examination and consideration of all factors which have a bearing on value when considered as a question of practical expediency. Theoretical depreciation is related to the problem of financing, whereas actual depreciation is related to present usefulness. Form 1, adapted from Floy's "Value for Rate-making," illustrates possible difference between actual and theoretical depreciation.

Curves 1, 2, and 6 represent actual depreciation, 1 and 2 as viewed from standpoint of salability, and 6 as viewed from standpoint of serviceability, assuming that maintenance keeps the asset at nearly 100% efficiency during most of its lifetime. Curves 3, 4, and 5 represent theoretical depreciation, each curve illustrating a different base or method of writing down. Floy says:

The curves 3, 4, and 5 indicate several classes of "theoretical" depreciation which have been quite widely used in some cases for estimating present values, but more often for determining the yearly theoretical deterioration for purposes of establishing depreciation funds, which, however, is quite a different subject. Making a theoretical estimate of the probable future, average, annually accruing deterioration of certain property to provide an item in bookkeeping accounts of operating expense has nothing whatever to do, in making an appraisal, with fixing the definite amount of absolute, actual, or accrued depreciation which depends upon the present condition of physical property, determinable from inspection and not upon historical documents, depreciation funds, or disputed theoretical conclusions.

Sometimes the distinction is brought out by the expressions **accounting depreciation** and **fair depreciation.** Accounting depreciation refers to book depreciation and is practically equivalent to theoretical depreciation. Its chief object is to provide an adequate financial policy regarding replacements and capital preservation. Fair depreciation is the depreciation of valuations—the amount to be deducted to ascertain **fair value.** This is chiefly an engineering problem in solving which the following should be considered:

1. Accounting depreciation.
2. Managerial policy regarding repairs, maintenance, and renewals.
3. Past and expected future performance of the asset.
4. Current operating expenses.
5. Monopoly of business possessed by company.
6. Going concern value.
7. Earnings of past periods.
8. Fitness of plant to meet present and future requirements.
9. Present efficiency of plant.
10. Length of time required to construct the plant *de novo.*
11. Appreciation due to natural causes.
12. Present and probably future earnings.
13. Franchises and other privileges owned.
14. Replacement cost.
15. Quality of service rendered.
16. Good-will.

CASH.—Cash includes money and whatever serves as money, as, legal tender, bank notes, checks, bankers' drafts, postal and express money orders, and, sometimes, postage stamps and I O U's. In the balance sheet, under current asset "cash" should appear only items really current. If the **imprest** system is in use the petty cash fund should be replenished before the books are closed.

Bank account and cash book should be reconciled and the amount should agree with cash in the balance sheet. All properly authorized **claims against cash** in bank should be treated as cash disbursed if regularly issued, whether or not presented for redemption at bank. **Checks** written but not mailed are not usually regarded as disbursements. **Items** left at bank for **collection and deposit** may be regarded as cash on hand. **Dishonored items,** if in large amounts, should be included among receivables. The occasional practice of including in cash **items collected after date of balance sheet** should not be tolerated.

If a concern receives payment for commodities in postage stamps and uses these in its own correspondence, such stamps on hand at end of an accounting period should be included in inventory of office supplies. Transfer from cash to supplies can be accomplished in either of two ways without interfering with the checking of cash against bank records. The **usual plan** is to record receipt of stamps in the cash book, then transfer them to the stamp drawer for office use. Since all other cash items are deposited, cash receipts do not agree with deposits, as per bank. To secure agreement make out a check payable to "Cash" or "Postage" and pass it through bank periodically as a deposit. The check appears in the cash book as a cash disbursement and makes a proper charge to the proper expense account—Postage, or Supplies. It also causes the concern's records to agree with those of the bank. **Another plan** is to employ a **postage journal** to record receipts and disbursements of postage.

Adequate cash control necessitates depositing all cash receipts and making all cash payments by check and the imprest system.

For managerial purposes it is necessary to separate cash into:

1. In safe or drawer.
2. In various working funds.
3. In petty cash fund.
4. In bank:
    (a) On current account.
    (b) Restricted.

The amount in bank on current account may be further subdivided into that to be used for immediate checking purposes and that upon which interest is earned. Amounts subject to interest are available on short notice, usually with sacrifice of interest earnings to date.

Cash held in foreign branches, if exchange rates vary little, may be incorporated in head office results at an arbitrary conversion figure, and substantially correct results will be secured. The most accurate results are secured by employing the rate of exchange prevailing at time of closing books. This should be used when exchange is not fairly stable. Sometimes it is advisable to set up a **Reserve for Fluctuations in Exchange,** to absorb too great a charge or credit to current Profit and Loss in case a very favorable or a very unfavorable rate prevails at date of conversion.

ACCOUNTS RECEIVABLE.—In the balance sheet only current items should be included under this title. Sometimes other receivables than those owing from trade creditors are included under this title, as accrued income from rents, etc., earned but not due; also:[25]

1. Cash deposited to cover breakage or damage to equipment in use, to guarantee the payment of prospective expense, or to guarantee good faith in performance of contract.

[25] R. B. Kester, Accounting, Theory and Practice, Vol. II, pp. 215–216.

2. Moneys advanced to subsidiaries, salesmen, and other employees on account of expenses and salaries.
3. Claims against creditors for returned or damaged goods, against railroads for lost or damaged goods, and against governments for rebates, drawbacks, and the like.
4. Prepayments on purchase or expense contracts, as payments made to bind a bargain or before delivery of goods; and expenses paid in advance, such as royalties, rents, interest, etc.
5. Unpaid calls or instalments on stock subscription contracts.
6. Claims against absconding officers for property appropriated or trusts violated.

A more definite term is "trade debtors." By using it the uncertainty attaching to more general expressions is avoided.

Estimating bad debts is the chief problem in the valuation of accounts receivable. A reasonable allowance for bad debts is recognized as a legitimate business expense. What is a reasonable allowance depends on circumstances. Such an estimate is necessary to charge the current period with its fair proportion of expense. If it is not made, the loss is not deducted until the individual accounts in question are proved bad. The amount of bad debts losses depends largely on the concern's credit policy, losses usually being large where the sales force is granted liberal credit-giving powers. An efficient **credit department** can do much to reduce such losses.

Percentage of loss varies for different lines of business and for different concerns in the same line. Each line has its **normal credit period** and the length of this has some effect on losses.

Experience within the business must be the guide in estimating bad debts losses. The accounts should be analyzed as to length of time they are past due, as, those overdue not over 30 days, less than 60 and more than 30, less than 90 and more than 60, those 90 days to 6 months overdue, those 6 months to one year overdue, and those more than a year overdue. Subtracting total overdue from total accounts receivable gives amount not overdue. This analysis, although not always necessary, is of value:

1. When, as in case of a new concern, there is no past experience upon which to base an estimate.
2. When an outside professional auditor is required to make the estimate.
3. When, periodically, it is desired to check up the work of the credit department.

Three bases of estimating bad debts, in each of which the amount is expressed as a percentage, are:

1. Amount of outstanding trade debts at date of balance sheet.
2. Amount of sales on credit made during present fiscal period.
3. Total sales for period.

Use of **trade debts** as a base is based on correct principles when the balance sheet is made up at the same date each year so that conditions as to periodicity of sales are the same year after year. If it is necessary to make the estimate more frequently than once a year, this situation does not hold because sales and collections vary with seasons. In this case one of other methods should be used.

Total sales, gross or net, serves as a good basis so long as the ratio of cash to credit sales remains fairly constant. If this ratio does not remain fairly constant, **credit sales** should be made the basis, or the changing ratio should be taken into consideration when making the estimate.

Collection costs take the form of discounts granted to encourage prompt payment and other expenses of collections. The weight of authority favors treating these as financial management items and consequently bearing no direct relation to sales. Some, however, regard them as deductions from sales revenue and make provision for them when valuing trade debtors. This is accomplished by estimating cost of collecting outstanding debts and also loss from discounts taken by customers and deducting a reserve therefor in the balance sheet.

In case of **receivables other than trade debts,** the same principles apply, in general, as in case of trade debts receivable. Some of these items are not current, as in case of the remote instalments where sales are made on the **instalment basis.** Suitable reserves should be set up and shown as deductions from the face amount on the balance sheet.

NOTES RECEIVABLE.—Notes are more formal than open accounts receivable, and in case the maker defaults, the loss of credit suffered is correspondingly greater. In general, however, notes are not more collectible than open accounts. Sometimes they are taken in settlement of slow accounts, and sometimes they are permitted to become past due without great effort being made at collection. Where not paid when due, new notes should ordinarily be demanded in their place.

Interest must be considered in valuing notes receivable. Most trade notes do not bear interest, so that they are not worth face value until due. If such non-interest bearing notes are of considerable amount, they should be shown at discounted value in the balance sheet. Interest-bearing notes are worth their face value.

"Notes receivable" should include only notes received from trade creditors. All others, such as those received from officers, should be placed in a special account. In general, such notes are not regarded favorably because there is no normal process of liquidation for them.

MERCHANDISE INVENTORIES.—This subject is treated in section on "Inventories." Merchandise inventories comprise all assets purchased for purpose of resale in the same or modified form. In case of manufacturers the division is threefold—raw material, goods in process, finished goods. Realizable value may be more or less than cost. This **realizable value** must be differentiated from **retail selling value,** because to value inventories on the latter basis would be to anticipate profits. The general rule of inventory valuation is cost or market, whichever is lower, and the prices used should be purchase or wholesale market. Since balance sheets are used as a basis for credit-granting, insufficient credit may be secured when inventories are stated at cost, whereas market prices have risen rapidly since date of acquisition. Under these circumstances a footnote in the balance sheet may be used to set forth current market value. Kester says:[26]

"The valuation formula of cost or market, whichever is the lower, while based on conservatism, may unnecessarily and improperly burden the current income account. Valuation at cost, on the other hand, while placing the profit or the loss in the period when realized, may cause the balance sheet to present an entirely inadequate and even misleading story as the basis for credit. To remedy this, three courses are open, viz.:

1. Carry the market valuation, whether more or less than cost, in a footnote to the balance sheet.

[26] Accounting, Theory and Practice, Vol. II, pp. 228–229.

2. In case market value is less than cost, set up a reserve out of profits equal in amount to the difference.
3. Carry in an inner column in the body of the balance sheet the present market value."

Depreciation of inventories results from changes in styles, overstocking, shelf wear, display, broken lots, etc. Where such depreciation exists, valuation at cost results in inflation. The proper basis of valuation is what goods of similar kind and quality could be bought for. This properly brings the deterioration in as a loss for the current period.

Cost of goods includes not merely invoice price, but any additional costs incurred in preparing the goods for sale, such as freight, drayage, warehousing costs, seasoning, etc. The method of distributing these additional costs over goods is a matter of policy to be determined by circumstances. Usually a percentage sufficient to cover all these items is spread evenly over all units comprising inventory. Where stock is of few types or varieties, a more accurate proration may be attempted, but this is not usually necessary.

Inventory-pricing usually requires the adoption of certain more or less arbitrary rules. One such rule is that the purchase price as per last invoice of an article shall be used as the inventory price. Difficulty arises if several purchases of a given article have been made during the past period, for then the last price governs under this rule. It may then be policy to use an **average price.** Kester says:

> The **weighted average,** whereby each purchase price is weighted with the volume or quantities purchased, is fairer, though more complicated than the straight average. Thus 10 units bought at $100 per unit, 15 at $90, and 3 at $110, would give a straight average of $100 but a weighted average of $95.71, $(1,000 + 1,350 + 330) \div (10 + 15 + 3)$. In manufacturing establishments where the fiscal period is short, say one month, and it is desirable to keep the raw material cost as nearly uniform as possible, the method of the weighted average is to be recommended.

INVENTORIES OF MANUFACTURERS.—Valuation at cost applies to **finished goods.** Under a detailed cost system this figure is the goal of the records. Where no such system is operated, the valuation is an estimate. **Raw materials** should be valued on same basis as goods bought for resale. **Goods in process** are of two classes, viz., (1) those manufactured for **stock,** and (2) those manufactured on **special order.** The first should be valued on a strictly cost basis, the problem being to determine what elements of cost have been absorbed therein to date. This can be done accurately only if a detailed cost system is operated. Goods manufactured under contract or special order may be valued somewhat differently. The sale has already occurred. A careful estimate should be made of cost to date. The estimated profit applicable to this may be taken into the current period. Periodic payments on such contracts usually make this plan practicable from the point of view of dividend requirements.

TEMPORARY INVESTMENTS.—These tie up funds only temporarily, whereas investments made to secure control of other companies or privileges necessary to the most efficient operation of business are **permanent** investments. A. L. Dickinson says that temporary investments "have no relation whatever to the business and can be disposed of without in any way interfering with its earning capacity, other than the loss of the dividends thereon." There are certain seasons when funds lie unemployed and it is desirable that these otherwise idle funds be invested temporarily. **Short-time notes** usually provide safety and freedom from fluctuations, whereas investments in stocks are more hazardous but at the same time may be the source of speculative profits.

Cost or market, whichever is lower, is the usual rule for valuing temporary

investments. If it is not desired to state this item at other than cost in the accounts, a footnote may be used in the balance sheet to express market value as of date of balance sheet. Another plan is to employ a "Reserve for Investment Fluctuations." Thus if at close of a fiscal period market is lower than cost, Surplus should be charged and the reserve credited for the difference. On the balance sheet this reserve should be regarded as offsetting the Investment account, the latter being stated at cost. By making the charge to Surplus, current Profit and Loss remains unaffected by investment fluctuations. If market value is greater than cost, charge the difference to the Investment account and credit the reserve. When the securities comprising the temporary investment account are sold, reverse the entry by which the reserve was created, so that the difference between cost and selling price will be shown as actual profit or loss. Surplus is affected only temporarily.

Stock rights sometimes apply to investments held temporarily. Should the balance sheet date fall between the time of their issuance and that of their disappearance, it may be desirable to book stock and rights separately. For method of valuing stock rights, see Index.

Investments carried on margin should be charged to Investment account and a liability account should be credited to show the amount loaned by the broker. It is customary to charge the interest on loans from the broker to the Investment account, and to credit this account with interest and dividends received. The equity is found by deducting the amount owed the broker from the asset account. The Investment account is credited when the securities are sold, the balance showing net profit or loss on the entire transaction. Sometimes, however, it is desirable to keep in separate accounts charges and credits occurring after the original purchase is made, in order to secure separate accounting for income and expense.

Amortization of bonds purchased at a premium or discount and held for temporary investment purposes is not customary.

Brokerage firms hold stocks and bonds as stock-in-trade and the same general principles of valuation should apply as with merchandise.

Unissued stock is sometimes included among temporary investments, there being a correspondingly equal inflation of capital stock. Such unissued stock is not a real asset. Preferably, it should be eliminated by being deducted from amount of stock authorized on the balance sheet.

Treasury stock is sometimes treated as a temporary investment. Preferably it should be treated as an offset to capital stock. If treasury stock is acquired by open market purchase, it should be valued at cost, and, in the balance sheet, preferably be shown as a deduction from capital stock.

ACCRUED ASSETS.—At any balance sheet date many items of income earned during preceding period have not yet been received in cash. These accrued assets are in form of accounts receivable, interest, rentals, royalties, dividends declared but not paid, etc. The inadequacy of a **cash basis** of accounting is now generally recognized, because the period in which cash is received is not necessarily the one which should receive credit for it. Accounting on an **accrual basis** requires that earnings of a given period be shown as such, even though not realized in cash in a later period. This requires setting up as assets in the balance sheet items of income accrued but not yet received. The setting up of such accrued items does not mean that they are legally collectible as at date of the balance sheet, but that they represent items of value which will in future become legally collectible.

These accrued items are usually **current assets** because the terms of settlement require liquidation within a comparatively short period. Many of these

tems represent income referable to particular assets, as, interest on notes, dividends on stocks, rentals on real estate, etc. Sometimes the policy is pursued of adding the accruals to the particular assets to which they are thus related, but it is usually preferable to show them separately.

In the **valuation of accruing items,** they should be prorated between the two periods on basis of time. The amount applicable to the period preceding the date of the balance sheet is the amount to be entered therein as an asset, but not necessarily at its face value. This should be discounted if there is doubt as to the collectibility of the entire amount when it falls due.

For discussion elsewhere of **accounting procedure** for accruals, see Index. The following illustration is adapted from Kester's "Accounting, Theory and Practice":[27]

At time of adjusting and before closing books, for every item of accrued income a separate asset account is set up. Thus, for royalties an account, Accrued Royalties Receivable, records the claim on account of royalties at same time the accrued income from royalties is being recorded in a suitable income account.

From this point **two methods** are in use to handle subsequent recording of the item. Under the **first method,** income when actually received or legally due is recorded in the regular income account. This shows an inflated figure because not offset by the portion credited to the previous period, the asset account covering this remaining unchanged throughout the current period. At its close, proper adjustment is made by adding to, or subtracting from, the amount held over from the close of the previous period, such an amount as will make its new balance show the correct amount of accrued income as at the close of the current period. The contra credit or debit to the above entry is, of course, to the particular income account, causing it to reflect true income for the current period.

Under the **second method,** the first entries for the new year consist in transferring all accrued income asset balances to their respective income accounts, where they automatically adjust the full receipt of income, a portion of which was credited in the previous period, to the amount properly belonging to the current period. At close of period, any adjustment on account of accrued income is handled by debiting the asset account and crediting the income account as before.

PREPAID ASSETS.—These are sometimes known as **deferred charges to operations.** They are usually given a separate balance sheet caption although analogous in some respects to current assets. They differ, however, in that they are not to be turned into cash shortly, but are to be used to save expenditures during the next period. When a subdivision known as "working assets" is shown, these may be included therein. Items listed as prepaid assets are: postage, stationery, printing, unexpired insurance, advertising and rent paid in advance, and, sometimes, organization expense. Valuation of all prepaid assets should be made on a **going concern basis,** the amount as at any given date being determined by a pro rata distribution of values based on life of the supply and part unused. Sometimes this class of items is roughly estimated and frequently overvalued. The only remedy for this is a periodic clean-up and consequent elimination of obsolete or unusable supplies.

LEASING ON ROYALTY BASIS.—The following is quoted from Kester's "Accounting, Theory and Practice":[28]

---

[27] Vol. II, pp. 251–253.
[28] Vol. II, pp. 255–256.

In some mining industries, notably coal and precious metals, leasing is done on a royalty basis with a minimum amount to be paid each period based on a minimum production of ore to be mined. If less than the minimum is mined, a frequent provision in the terms of the lease makes possible the application of any royalties overpaid one period against a future production of more than the required minimum. That is, no increased royalties are charged for a production over the minimum until all accumulated royalties from periods of underproduction are used up. In any period of underproduction, such royalties may properly be treated as **deferred charges** only on condition that there is reasonable expectation that future production will increase to the point where it will consume the overpaid royalties of earlier periods. At times a company finds itself bound to such a contract, based on a minimum production, without any hope of relief because the prospect has not developed as anticipated. Under such conditions the entire periodical royalty charge is a charge against operation and must be absorbed entirely by the operations of each fiscal period.

PERMANENT INVESTMENTS.—Permanent investments are those which are insome way useful in the continued operation of a business. If disposition of investments in no way affects its efficiency or its privileges and obligations, the investments are temporary; otherwise they are permanent. Mere ease of conversion into cash is not a test.

Permanent investments made to aid operations usually consist in the ownership of stock of other corporations. Sometimes the owning company is merely a holding company, sometimes it also engages in operations. Sometimes permanent investments take the form of **advances** to other concerns, sometimes of an interest, active or silent, in a partnership. The **evidence** may be either **formal securities** or **open book accounts.** Sometimes the chief purpose is to secure control of a series of successive operations or stages in productive processes; sometimes it is to secure control of conpeting enterprises of the same type. Such control is secured by **full ownership** of the subsidiary or competing enterprise, by a **controlling interest,** through interlocking directorates, through large advances made to assist the company controlled, etc.

In case of a **holding company** and subsidiary enterprises, it is now customary to set up a **consolidated balance sheet** which shows the true status better than a balance sheet of the controlling company which merely lists investments in subsidiaries. (See section on "Consolidations.")

Valuation of Permanent Investments.—Since this form of investment is a fixed asset, market fluctuations should be ignored. **Cost** is the controlling factor, but there may be reason to modify it because of the fact that stock of another company owned changes in intrinsic value with the changing fortunes of the issuing company. In this way securities differ from physical assets. It is necessary to make a valuation of the subsidiary concern to secure an approximately accurate valuation of its stock. If **advances** are made to a controlled enterprise, these must be valued separately from stocks of subsidiary owned. If a consolidated balance sheet is set up, these intercompany items are eliminated. Advances may be temporary or permanent and their exact status is sometimes difficult to establish; consequently, care should be used to see that they represent real asset value, not mere losses resulting from the loaning of funds to unprofitable subsidiaries. Each case must be settled on its merits after investigation. **Temporary loans** which have every prospect of repayment should be listed at face value. If repayment is to be made in securities of the subsidiary and it is prosperous, the advance should be carried at par as a fixed asset. If the securities have been received, they should be valued as any other permanent investment. If there is no prospect of repayment of advances, they should be regarded as expenses.

If the investment does not give control to the concern making it, they

should ordinarily be carried at cost, although it is sometimes desirable to show their market value in a footnote.

INVESTMENTS IN BONDS.—Bonds are usually bought at a premium or discount which necessitates the application of the principles of amortization. (See section on "Mathematics.")

Recording Bond Investments.—The following is adapted from Kester's "Accounting, Theory and Practice":[29]

When bonds are purchased, the record may be made in two ways. Accounts may be kept with the bonds at par, separate valuation accounts being carried for the discount or premium. An account with Bond Interest is also opened and sometimes one with Prepaid Interest on Bonds, where, as is usually the case, the bonds are bought with accrued interest to date of purchase. The accrued interest, however, is more conveniently recorded as a charge in the Bond Interest account, thus automatically adjusting the income from the bonds when the first coupon after date of purchase is redeemed. The **second method** is to record purchases at cost in the Bonds account, carrying there full information as to premium or discount, no separate accounts with these being opened. When bond interest falls due, the Bonds account itself is written up or down for the amount of the discount or premium accrued during the current period. The contra entry is in the Bond Interest account just as above. This method is not to be recommended when the only record kept of bonds is that mentioned above. If the investments are so numerous as to require a subsidiary ledger for their record, where with each kind of bond, accounts would be kept with its par, discount or premium, and interest, there is no objection to handling the controlling account on the general ledger by making the discount or premium adjustment directly to the Bonds account. Fuller information is given and the record is less involved, however, when handled by the first method.

For **formulas** for determining present worth at compound interest of sums of money due at given future dates, for finding amounts and present worths of annuities, and for finding valuation of bonds, see section on "Mathematics."

SINKING FUNDS.—If the securities in the fund are the **company's own bonds,** they should ordinarily be valued at cost, the discount or premium being amortized over their remaining life. If the bonds are purchased and canceled, they should be deducted from bonds outstanding. If not canceled, they should be held as assets.

If **securities of other companies** are bought for sinking fund purposes, they should be valued as long-term investments, premium or discount being amortized on a scientific basis. The credit of the issuing company should be considered, and if liquidation in full at maturity is doubtful, reserves should be established to offset the expected shrinkage.

EQUIPMENT.—Here are considered machinery, tools, furniture and fixtures, and other forms of equipment. Status of the enterprise as a going concern is important because items bring a small percentage of going concern value if subjected to forced sale. Market value is not a factor. The **basis of valuation** should be cost less depreciation.

The **legal distinction** between most items of equipment and land and buildings is that the former is **personal property,** whereas the latter is **real property.** Sometimes this distinction is important, as when it is desired to ascertain what items are included as security for a bond issue secured by a real estate mortgage.

Machinery and tools comprise a broad class of assets. The method of valuation depends upon the accounting records kept. The principle to be fol-

[29] Vol. II, pp. 267–268.

lowed is cost less depreciation. Since different kinds of machinery depreciate with varying degrees of rapidity, it is desirable for accounting purposes that these assets be classified with these differences in mind. It is especially important that in the accounting records machines and tools be distinguished, because of the more fixed nature of the former. **Machine tools** should be distinguished from **hand tools.** The former should be regarded as part of the machine even though replaced more frequently than the machine. Where the amount of machinery is large, a **machinery ledger** should be kept. This corresponds to the **plant ledger** described in section on "Depreciation."

Cost of machinery includes invoice cost, freight, insurance during transit, drayage, and installation. **Cost of power attachments** are usually regarded as a **power equipment cost.**

Periodic revision of depreciation rates on machinery are desirable, the frequency of such revisions depending on nature of the machinery and the amount of experience data available when the original estimate is made. In some instances enough experience data is available to permit the construction of **curves** showing life expectancy. See discussion in Saliers' "Depreciation, Principles and Applications," pp. 427–432.

Overtime is a factor to be considered in the valuation of machinery. See section on "Depreciation."

Tools are frequently carried in a Materials and Supplies account and, when issued, are charged as expense. Another plan is to charge all tools purchased for two or three years to an asset account, thereafter to expense, a revision being made periodically. Usually **loss** of tools is a considerable item and must not be neglected in any comprehensive investigation.

In case of tools and machinery made in the factory in which used, the **basis of valuation** is cost of manufacture less depreciation.

Cost of rearranging machinery if it increases earning power or prevents it from being diminished may properly be capitalized, but it is best to keep a separate account for such items. Frequently it is safe to write such costs off over a comparatively short period.

Furniture and fixtures should be valued on a cost less depreciation basis. Scrap or salvage value is usually negligible. In some cases the **inventory method** of valuation is preferable to the **appraisal method,** based on cost less depreciation.

Delivery equipment should be valued on a cost less depreciation basis, unless the circumstances make the **inventory method** preferable. **Horses** depreciate rapidly, but at rates which vary greatly under varying conditions. Sometimes purchases of horses are capitalized over the period of a few years and thereafter are charged to expense, a revision being required in case the number used changes materially.

Wagons and automobiles should be frequently checked up by physical inventory. Cost less depreciation is the basis of valuation. If numerous, a **delivery equipment register** or **ledger** should be kept showing the history of each unit.

Carriers and containers include bottles, baskets, boxes, kegs, barrels, etc. In some lines the customer is charged at cost for containers sent him and when he returns them they are redeemed. This requires the keeping of a **redemption fund.** In other lines the only feasible plan is a high depreciation rate, varying usually from 15% to 25% per annum.

Patterns, molds, etc., should be charged, preferably, to the particular job for which made. Where products are standardized, this plan may be departed from, but in any event such items should be rapidly depreciated.

BUILDINGS.—The basis of valuation is cost less depreciation. If buildings are bought for cash, purchase price plus any expenditures incident to title acquisition is the cost. If purchased by issuance of securities, it is customary to regard the par value of the securities issued as the value of the building, and in the absence of fraud such values usually stand the test of inspection by courts. The **real value** of the securities issued in payment is involved, and this involves a valuation of all assets, including the ones purchased by such issue of securities, and consideration of all liabilities, as well as earning power. When buildings are constructed by the company which owns and uses them, cost includes not merely labor, material, and overhead, but also any other expenses incurred to further construction—architect's fees, licenses, permits, interest on borrowed money during the construction period, costs incurred in connection with accidents, damages, strikes, etc. Costs of preparing the site, such as wrecking of old structures, are properly capitalized. Where a building comes into use in sections as prepared for occupancy, expenses incurred in connection with occupied sections become revenue charges, whereas those applicable to sections not ready for occupancy should be capitalized. In case of completed buildings, changes in interior arrangement or equipment should be capitalized only in case they result in greater earning power. A **subsidiary record** of buildings showing details of costs is essential for adjustment of fire losses, as well as for the routine of charging off of depreciation. See tables of depreciation rates in section on "Depreciation."

LAND.—Land is not a wasting asset. It is or is not desirable to keep separate accounts for separate parcels of land, according as they do or do not require different treatment. Sufficiently detailed explanation should accompany the account to enable one at any time to ascertain the **component parts** of cost. Among these are purchase price, purchasing agent's commission, title search and guaranty (if borne by purchaser), notarial and recording fees, taxes accrued at date of purchase, and assessments for local improvements.

Cost is ordinarily the basis of land valuation; therein being included, in addition to above items, cost of improvement, such as draining, filling, grading, and leveling. Sometimes the cost of constructing dams, dikes, embankments, and slide is added. In case of **mining land,** cost of stripping and tunneling in preparation for removal of ores may properly be added to cost of land.

So long as land is used for the purpose for which purchased, it should neither be depreciated nor appreciated. If desired to indicate market value, this can be done in a footnote.

Land normally appreciates owing to scarcity, location, and adaptability. This appreciation is sometimes called the **unearned increment.**

Issue of bonds secured on land is sometimes regarded as justification for bringing appraised value of land upon the books in excess of cost, because otherwise the full value of security does not appear. When this is done, the increased valuation should be offset on the credit side of the books by a **Reserve for Appreciated Land Value.**

When **depreciation** of land is clearly evident, provision should be made to cover it, so that the loss will not fall entirely in one period.

Land purchased to meet future requirements is an **investment.** In the accounts it should be segregated from land used for operating purposes. It should ordinarily be carried at cost. **Carrying costs** are additions to the investment and should be capitalized up to date such use begins. A **reserve** should be set up for the amount of such carrying charges, to become an addition to surplus when such land is put to its intended use.

Land donated should ordinarily be brought on the books at a **fair appraised**

value, and the credit made to Donated Surplus. Sometimes, however, a **nominal valuation** is used. If the gift is conditional and subject to reversion if conditions are not fulfilled satisfactorily, it should not be shown as an asset.

Realtors deal in land as stock-in-trade, in which case it is a current asset. Costs of preparing such land for marketing should be added to it. Portions of the land may be appropriated for streets, alleys, parks, etc. The cost of such land should be prorated over that which is to be sold as plots. Ordinarily all costs should be kept by plots to permit determination of profit or loss on each transaction. After the stage of sale is reached, all costs should be regarded as operating costs to be charged against revenue. It is permissible to charge them as costs, however, if suitable valuation reserves of equal amount are set up.

WASTING ASSETS.—These are assets subject to depletion, such as **mineral deposits** and **timber lands.** The supply of this kind of assets is diminished by being used up or disposed of. Because of the peculiar character of such assets, it is recognized as proper to return a part of capital in dividend payments.

Valuation of Wasting Assets.—The valuation of wasting assets is necessary for a correct accounting for invested capital and the consequent determination of income for income tax purposes. In *Stratton's Independence, Ltd.* v. *Howbert*,[30] it was decided that ores before mined do not possess any latent or occult values but should be valued on practical market considerations. The income tax law of 1913 recognized an allowance for depletion "not to exceed 5 per cent of the gross value at the mine of the output for the year for which the computation is made." Nothing was said in the law as to what was the proper basis for determining **total value** to be written off for depletion. The law of 1916 provided that the depletion allowances should not exceed "market value in the mine of the product thereof which has been mined and sold during the year for which the return and computations are made," but the total thus allowable was not to exceed original investment, or, if the deposit was purchased before Mar. 1, 1913, fair market value as of that date. The 1918 law provided for a "reasonable allowance for depletion . . . according to the peculiar conditions in each case, based upon cost including cost of development not otherwise deducted." In case of properties acquired before Mar. 1, 1913, the **fair market value** as of that date is the basis. Further provision was made for discovery of natural resources on or after Mar. 1, 1913, where fair market value is "materially disproportionate to cost," in which case **fair market value** as at discovery date or within 30 days after discovery is the basis.

Two bases for depletion charges are thus introduced, viz., **cost** and **fair value.**

Until the advent of the income tax, the most authoritative interpretations of depletion theory were that the depletion allowance should be based strictly on **original cost,** the only effect of new discoveries being to lessen amount of depletion per unit of output. The present theory and its application are thus stated by Wm. B. Gower:[31]

Theory:

1. That gradual exhaustion of the ore body is an element of expense which should be taken up in each and every fiscal period during which minerals continue to be won from the mine, at a more or less constant rate per ton.

2. That the total expense of this character to be absorbed in the operating accounts is the intrinsic value of the mine content (in place, en bloc) which existed from the beginning, although much of it may have been latent and determined only by "extension in depth."

3. That by the term "intrinsic value of the mine content" as used above is meant the product of two factors:

[30] 231 U. S. 399 (decided Dec. 1, 1913).
[31] *Journal of Accountancy*, Aug. 1918, pp. 85–86.

(a) The tonnage of mine content as finally ascertained.

(b) A unit price per ton representing the bedrock value of the average grade of ore, in place, en bloc, including proved ore, probable ore, and prospective ore, estimated at the commencement of business. In bedrock value the price of metals in estimated mine content is calculated at some figure between "basic" and "normal," cost of production and selling is calculated at maximum probability; the rate of mining and the life of the property must be estimated; from these factors a discounted or present value at true rate of interest is obtained; and this capital value is then reduced by a substantial value due to the element of risk.

Application of theory:

1. The depletion expense of each and every fiscal period during which mining operations occur is the tonnage of ores extracted multiplied by the more or less constant rate per ton established by original estimate of value in place.

2. The rate per ton of ore extracted, for purposes of the depletion expense computation, would change only in the event of subsequent discovery of relatively large bodies of ore of a grade differing widely from the original estimates.

3. In the case of "extension in depth" developing new values, it may be necessary from time to time to adjust the book value of the mining property, in order to harmonize with intrinsic value.

As stated by Gower, the theory of depletion requires occasional adjustment of book values of natural resources to keep them in agreement with progressive development resulting from new discoveries. In case of valuations made as of Mar. 1, 1913, to bring books into agreement with fair valuation as of that date, a **special surplus** account should be credited for the amount of the increase.

Treasury regulations governing methods of making valuations were last revised as of Dec. 19, 1920. Owing to frequent modifications, detailed requirements cannot be discussed here. Main requirements are that the valuation as of a specified date must be made "in the light of conditions and circumstances known at that date, regardless of later discoveries or developments in the property or subsequent improvements in methods of extraction and treatment of the mineral product."

The value should be such as would be established as the result of a bona fide transfer between a willing buyer and a willing seller as at the date in question.

Where cost serves as a basis for determination of depletion charges, the Treasury requires that the basis shall be the fair market valuation as of a "basic date," i.e., Mar. 1, 1913, in case of property acquired before that date, the date of acquisition in case of property acquired on or after Mar. 1, 1913, or the date of discovery, or within 30 days thereafter in case of property discovered after Mar. 1, 1913.

Fair Market value is the amount which "would induce a willing seller to sell and a willing buyer to purchase."

Treasury regulations provide that where fair market value as of a given date is to serve as the depreciation base, such valuation must be determined "in the light of conditions and circumstances known at that date, regardless of later discoveries or developments."

The Treasury has adopted the **present value method** of valuation, but considers any and all factors throwing light on what market value is. Among these are: cost, actual sales and transfers of similar properties, market value of stocks or shares, royalties and rentals, value fixed by owner for purposes of capital stock tax, valuation for local or state taxation, partnership accountings, records of litigation in which the property was in question, the amount at which the property may have been inventoried in probate court, and disinterested appraisals by approved methods.

Present Value Method.—The following principles have been laid down by the Natural Resources Division of the Income Tax Unit of the Treasury Department:

1. Increase in mine values is not unearned increment since the work of development merely develops what already existed in the ground; it does not add to values in the sense that the value of real estate is enhanced by community development, improved methods of transportation, and so on.
2. That exhaustible capital values must be recognized.
3. That an allowance must be made not only for the return of cost but also for the replacement of exhausted mineral.
4. That mining must be regarded as a continuing industry, because organizations built up to engage in the successful exploitation of mines are of too great value to be permitted to be discontinued by the exhaustion of any one property.

The present value method has been approved by the United States Supreme Court, the American Institute of Mining and Metallurgical Engineers, and other competent authorities.

To determine fair market value by this method, the following factors must be determined for each deposit:[32]

1. The total quantity of mineral in terms of the principal or customary unit (or units) paid for in the product marketed.
2. The average quality or grade of the mineral reserves.
3. The expected percentage of extraction or recovery in each process or operation necessary for the preparation of the crude mineral for market.
4. The probable operating life of the deposit in years.
5. The unit operating cost, i.e., cost of production exclusive of depreciation and depletion.
6. The rate of interest commensurate with the risk for the particular deposit.

In case of **well-developed properties,** much of this information can be derived from past operating experience. Allowance should be made for probable future variations in rate of exhaustion, quality of mineral, percentage of recovery and costs of producing and selling. If past operating experience is lacking, the information may be deduced from concurrent evidence. The Treasury requires that deposits of different grades, locations, and probable dates of extraction be valued separately.

Utilizing the required information, present value is found by—

1. Finding the total expected operating profit, secured by multiplying the number of units of mineral recoverable in marketable form by the difference between selling price and operating cost per unit.
2. Reducing the total expected operating profit for each mineral deposit to a present value as of the basic date (Mar. 1, 1913, or a later date) at the rate of interest commensurate with the risk involved. This value should be further reduced by the value, as of the basic date, of the depreciable assets and prospective capital additions essential in the process of realizing said profits.

Segregation of Minerals.—Minerals which cannot be mined before a definite future period in time should be classed separately. The Mines Taxation Committee of the American Institute of Mining and Metallurgical Engineers

[32] Reg. 62, Art. 256.

suggests that no mine be valued on an estimated operating life of more than 45 years. R. V. Norris says:[33]

> . . . a proper time limit for available mineral shall be such that its present value on an annuity basis would be 90% of the present value of an infinite amount, i.e., a perpetual annuity. At 6% discount rate this time limit would be 40 years' life, and at 8%, 30 years, which may properly be considered as a maximum.

Of minerals which cannot be extracted within, say, 40 years, there are two kinds: (1) known reserves, and (2) unknown deposits subject to future discovery. For known minerals which cannot be worked within 40 years little is paid, because the discounted value of a dollar due in 40 years is a small amount. Depletion per unit of output should be based on the amount which can be extracted, say, within 40 years. If additional quantities are included, depletion per unit is too small.

Minerals not to be extracted within a reasonable time should be segregated as an investment not subject to depletion. When such reserves are ultimately worked, there will be no depletion allowance because total investment will have been returned before the reserves are exploited.

Value at Given Date.—Value at a given date for depletion purposes is:

The amount secured by discounting, at compound interest, to that date, total net profits year by year, less
The discounted value, at basic date, of the depreciable assets and capital additions thereto necessary to realize the profits.

The amount thus secured, when applied to the estimated available tonnage, for depletion purposes, will return the value of the property when the estimated tonnage is exhausted.

The Engineers' Committee of the National Coal Association suggests that the basis for determining the amount to be allowed during any one accounting period be based on earnings instead of on amount of ores extracted, so that the burden is more equitably distributed, prosperous years bearing a heavier burden and lean years a lighter one than if depletion is applied on a tonnage basis.

Rate of Interest.—Determination of rate of interest involves consideration of risk involved, changing rates of interest over periods of many years' duration, and so on. Norris considers 6% proper in most cases, because it has the authority of being a standard legal rate. He says a higher rate may be used where there is question as to extent or continuity of the deposit.

The Mines Taxation Committee of the American Institute of Mining and Metallurgical Engineers suggests a rate of 4%, compound interest. The Treasury uses 6% for anthracite mines, and 8% for bituminous mines. C. E. Grunsky says the rate should vary with the risk.[34] Hoover lists the risks of mining as follows:

1. Risk of continuity in metal contents beyond sample faces.
2. Risk of continuity in volume through blocks estimated.
3. Risk of successful metallurgical treatment.
4. Risk of metal prices, in all but gold.
5. Risk of properly estimated costs.
6. Risk of extension of ore beyond exposures.
7. Risk of management.

Hoskold's Table.—The following table is used by the Treasury in valuations made by discounting prospective earnings.

---

[33] Columbia Income Tax Lectures, 1921, p. 230.
[34] Valuation, Depreciation and the Rate Base, p. 241.

Present Worth of Each Dollar of Operating Profit

Accumulated during life of n years, assuming annual rate of production and operating profits per unit to be uniform and providing for interest on present worth at r' per cent annually and a payment into a sinking fund which at 4 per cent, interest compounded annually, will amount to the present worth, i.e., provide for return of capital, at the end of life.

Factors in Above Table

$$\frac{P_n}{n} = \cfrac{1}{\cfrac{nr}{R^n - 1} + nr'}$$

Derived from Hoskold's Formula

$$\left.\begin{array}{l}\text{Present value of \$1 per annum in } n \\ \text{years, interest on capital being at} \\ \text{one rate, } r'\text{, and for redemption an-} \\ \text{other rate, } r\text{, per cent.}\end{array}\right\} = P_1$$

$$P_n = \cfrac{1}{\cfrac{r}{R^n - 1} + r'} \quad \text{where } R^n = (1+r)^n$$

Wasting Assets Illustrated.—Copy of memorandum prepared by Metals Valuation Section of the Income Tax Bureau in determining valuation of a mine at Mar. 1, 1913.

Ore reserves Mar. 1, 1913	875,000 tons
Gross value Mar. 1, 1913 (875,000 × \$12.78)	\$11,182,500
Selling price of metal in ore reserves—actual or anticipated.	
Gross cost Mar. 1, 1913 (875,000 × \$7.1537)	6,259,487
Cost of mining and extracting metal in ore reserves—actual or anticipated and exclusive of depletion and of depreciation of plant.	
Art. 206 of Reg. 62, defines such "cost" as comprising all current expenses of producing, preparing and marketing the mineral product sold, exclusive of federal income and profits taxes, allowable capital additions as defined in Art. 222 of Reg. 62, and deductions for depreciation and depletion, but including cost of repairs and replacements necessary to maintain the plant and equipment at its rated capacity and efficiency.	
Net returns (actual or anticipated)	\$ 4,923,013
Present worth (discounting at 15% and 4%, using 8-year life).	
Present worth is inclusive cost of plant and is based on earnings on capital or purchase price at the rate of 15% per annum and making payments into a sinking fund which at 4% compounded annually will provide for the return of capital at end of 8-year life.	
The above table is calculated for the investment of a sinking fund at 4%, the variables being the rate of discount on capital and the years of life. From the table we find that the present value of each dollar of operating profit accumulated during the life is .483507.	
Present worth therefore is \$4,923,013 × .483507 =	\$ 2,380,311
Deduct cost of plant (actual or prospective)	1,000,000
The Treasury deducts the full cost (actual or prospective) of the plant from the Mar. 1, 1913, present value of the mine on the assumption that the plant must be constructed and the full investment therefor made at the beginning of the period during which the ore is to be removed. If the plant had been constructed prior to Mar. 1, 1913, its value at that date would be deducted.	
Market value of ore en bloc Mar. 1, 1913	\$ 1,380,311
Unit of depletion per ton (\$1,380,311 ÷ 875,000 tons)	\$ 1.5775

LEASEHOLDS.—A lease may be paid for in annual sums or in a bonus and annual sums. The bonus is a deferred charge to be spread as an additional item of rent over the period of the lease.

Ordinarily leases run for periods up to 99 years. In New York State, 63 and 84 years are favorite terms.

When an original lessee sells a lease outright for a fixed sum sufficient to cover the remaining period of the lease, this sum is figured as the present worth of an annuity equal to a fair yearly rental.

When a lease is bought outright or a bonus is paid, it appears on the books at a valuation. In case the balance sheet is to be used for credit purposes and, owing to great appreciation in property values, the lease is worth much more than its book value, it is proper to indicate this in a footnote, or else to incorporate it in the balance sheet with an offsetting reserve.

The amount at which the lease is carried on the books must be amortized over the period of the lease, the periodic charge being to **Rent.**

If title to the building constructed on the leased land is to pass to the owner of the land upon expiration of the lease, the cost of the building must be written off over the life of the lease.

Theoretically any excess of depreciation over normal resulting from this situation is **rent,** but is not usually segregated.

INTANGIBLE ASSETS.—These should always be listed separately to permit verification.

The chief types are good-will, patents, copyrights, trade-marks, franchises, going concern value, and organization expense.

Patents are grants by a government giving to an inventor exclusive right to make and sell his invention for a term of years.* Patents should be capitalized at cost. When paid for in stock, the determination of cost is less simple than when paid in cash. There can be no objection to basing value upon **par** of stock, in absence of fraud or deceit. Overvaluation arising in this manner means higher amortization charges and consequently higher costs of production.

Where an experimental laboratory is conducted, expenditures directly unproductive of results are properly regarded as indirect costs of such patents as are developed from time to time.

Costs of defending rights to patents may properly be capitalized.

Ordinarily patents should be written down on the basis of **expiring time,** the distribution being made over the life of the patents. In many instances, supersession or obsolescence may shorten a patent's useful life. When this occurs, the patent should be written off more rapidly.

Some authorities advocate rapid writing down of patents during the early years when their earning capacity is greatest.

Sometimes the life of basic patents is extended by securing auxiliary patents on improvements made on the old invention. When this policy is pursued, a feasible plan is to write off 1/17 of total value to date at end of each year.

In writing down patents the charge is to expense and the credit to a reserve for depreciation. The incidence of this depreciation expense is to **manufacturing cost** or to **selling cost,** according to circumstances.

Copyrights are issued for a term of 28 years, with renewal privilege for a like period if application therefor is made within one year prior to expiration of the original copyright. They should be capitalized at cost, which, in case of the original holder, usually consists only of fees. Appraisals should be made frequently and these will usually justify a very rapid writing down.

Trade-marks should be valued at cost, whether cost of development or cost of purchase. The principles of valuation are analogous to those applicable to good-will.

Franchises are frequently listed in the balance sheets of public utilities. They are privileges granted to a company to use public property. They may be perpetual, limited, or determinate. Franchises should be booked at cost of acquisition, including:

1. Lump sum payments, to the state or some division thereof, applicable to life of franchise.
2. Purchase price paid for assignment of rights and privileges by another company.
3. Legal and other fees paid to secure the grant.
4. All other legitimate expenses.

Depreciation of franchises depends on the terms of the grant. If the franchise is perpetual, there is no depreciation. If for a definite term of years, it should be prorated accordingly. If indeterminate, a liberal depreciation policy should be followed.

ORGANIZATION EXPENSES.—These should be written off rapidly. R. H. Montgomery suggests writing them off over the first 2 years' operation. They consist of attorney's fees, incorporation fees, cost of prospectuses, cost of soliciting stock subscriptions, promoters' and organizers' fees, cost of printing and issuing stock certificates, etc.

GOOD-WILL.—See section on "Good-Will."

Methods of Depreciation

Depreciation and the Income Tax

Depreciation Rates for Specific Assets

(For list of forms, see complete table of contents.)

SECTION 11

DEPRECIATION

General Principles

CAUSE OF DEPRECIATION.—Cause of depreciation may be generalized under three heads: **wear and tear, obsolescence,** and **inadequacy.** The specific causes are very numerous, and there are many factors affecting its rapidity and extent. Among these are: quality of construction, adequacy to meet future demands, method of operation, repairs and renewals, climate, etc. In case of such intangibles as patents, copyrights, and leaseholds, progress of depreciation may usually be assumed to be in direct proportion to expired time. Matheson[1] gives the following **causes of depreciation:**

1. Wear and tear.
2. Tenure of holding.
3. Permanency or steadiness of industry.
4. Exhaustion of raw materials.
5. Obsolescence due to new inventions, new product, or better ways to make the same product.
6. Vicissitudes and catastrophes not insurable.
7. Fluctuations in trade.
8. Inadequacy.

DEFINITION.—No satisfactory general definition can be given, since the term is usually employed in a limited sense. Sometimes it includes repairs, sometimes not. H. V. Hayes says depreciation is "loss in value which has occurred arising from the period during which the property of the undertaking has been in service." The Interstate Commerce Commission defines depreciation as "exhaustion of capacity for service," "lessening in cost value," and "lessening in worth of physical property." P. D. Leake defines it as "expired capital outlay." Sometimes attempts are made to express progress of depreciation between dates.

CLASSIFICATION OF DEPRECIATION.—**Unit depreciation** refers to a unit of plant. **Composite depreciation** refers to plant as a whole; it is the sum of depreciation of the units. Unit depreciation progresses until it causes displacement of the unit. Composite depreciation reduces a plant or system to a status of normal depreciation, after which further depreciation is prevented by replacements. Composite depreciation usually reduces investment in plant by about 20% or 30% of the original. If amount of outstanding stock is not diminished, composite depreciation results in overcapitalization,

[1] Depreciation of Factories, pp. 36–41.

because a part of the investment has disappeared. This may be prevented by reducing total capital through retirement of stock in an amount equal to composite depreciation, charging cost of retirement to revenue, or by creating a **replacement reserve** to offset depreciation. If not required for replacements, this reserve may be used to make extensions. Since no specific replacement is made in this case, it is impossible to charge reserve with cost of any particular unit of plant. It is charged only when some unit is discharged and regardless of time when new assets are installed.

Functional depreciation results from **obsolescence** or **inadequacy** of a plant or unit of plant. Its amount is determined by the extent to which service could be cheapened, in case of obsolescence, or bettered, in case of inadequacy. When written-down value of an old unit can be added to cost of a new one and still permit production to be carried on at a lower capital cost, the old unit is wholly obsolete or wholly inadequate. Inadequacy results from changes in financial policy, engineering progress, and unexpected developments. Preceding the time when inadequacy becomes effective, the margin of value is usually diminished more or less rapidly by the effects of invention or of increasing demand. Obsolescence resembles inadequacy, but it is a question rather of type and quality, than of size and power. An illustration is substitution of electric transmission for older forms of power conveyance.

DETERMINATION OF INADEQUACY.—Inadequacy may be determined on basis of capitalized cost of production of a unit of output, or by same method as is used to find obsolescence. Former method is better if more than one old unit of plant is required to do some work that one new unit will do. It is illustrated thus:

If total cost of producing a unit of output with an old machine is $20, and with new machine is $18, saving per unit is $2. If number of units of output produced with old machine is 100, total saving is $200. 200 ÷ .05 = 4,000, which is functional depreciation of old plant and amount over and above depreciated value of old plant which the company can afford to pay for a new machine, providing old one can be disposed of at depreciated value. Since amount that old property would bring at sale is probably small, it may be economical to retain it for some time after a more efficient type comes on the market.

OBSOLESCENCE.—Obsolescence becomes effective only when production can be carried on more cheaply by replacing a given unit the undepreciated or unrecovered cost of which is considered as a part of replacement cost. It is measured by the amount by which cost less salvage exceeds amount of depreciation already written off.

Determination of Obsolescence.—Following is an illustration of method of determining obsolescence:

Assume case of a machine which cost $10,000, possesses an estimated life of 10 years, and a scrap value of $1,000. Also assume that 5 years of useful life have expired and that at close of each year a depreciation reserve has been credited with 1/10 of ($10,000 − $1,000), or $900, so that there exists a reserve of $4,500. There is an additional $4,500 to be accounted for, either in form of future charges to depreciation or as obsolescence and inadequacy. Assume that at end of 5th year a new machine which costs $8,000 comes on market which will perform equivalent service at smaller total cost per unit of output. The two elements entering into cost of production are: (1) uncovered investment in machine, (2) necessary current expenses, as labor and power. Assume that an investigation shows these for old and new machines to be, respectively:

Old Machine		New Machine	
Unrecovered cost, i.e., cost less depreciation earned	$5,500	Unrecovered cost, i.e., cost less depreciation earned	$8,000
Current operating expense	600	Current operating expense	400

If money is worth 6%, capitalized cost of operating old machine is $600 ÷ .06, or $10,000, that is, it is equivalent to a capital investment of $10,000; whereas capitalized cost of operating new machine is $400 ÷ .06, or $6,666.67. Adding these to original costs of respective machines, we have:

For old machine:	
Original cost less earned depreciation	$ 5,500.00
Capitalized operating cost	10,000.00
Total capitalized cost	$15,500.00
For new machine:	
Original cost	$ 8,000.00
Capitalized operating cost	6,666.67
Total capitalized cost	$14,666.67

As compared with a new machine of equal capacity, the old machine is worth $4,666.67. This is obtained by deducting excess in total capitalized cost of old machine over that of new machine ($833.33) from the unrecovered investment in old machine ($5,500). As salvage value is only $1,000, to scrap it would mean a loss of $4,666.67 − $1,000, or $3,666.67, and no saving in total capitalized cost of production, because when old machine is valued at $4,666.67, it produces as cheaply as does the new machine. True total capitalized cost of production if old machine were scrapped would be:

Original cost of new machine	$ 8,000.00
Unrecovered cost of old machine (less salvage)	4,500.00
Capitalized operating cost	6,666.67
	$19,166.67

On the other hand, capitalized cost of operating old machine is only $15,000. If new machine could be bought for $8,000 − $4,166.67, or $3,833.34, new and old machines would be on a par and it would be immaterial whether replacement were made or not. Same would be true if capitalized operating cost of operating new machine could be reduced to $6,666.67 − $4,166.67, or $2,500 (which is an operating expense of $150 capitalized at 6%), for then we should have:

Original cost of new machine	$ 8,000.00
Unrecovered cost of old machine (less salvage)	4,500.00
Capitalized operating cost	2,500.00
	$15,000.00

Before a machine can be said to be obsolete, it must be shown that production can be carried on more cheaply with a new machine to whose cost has been added the unrecovered cost (less salvage) of the old one. Unless a machine is rendered entirely obsolete by a new invention, it is not affected, because it continues to be cheaper to operate the old machine than to scrap it and buy the new one.

DEPRECIATION BETWEEN DATES.—Lifetime of an asset is time which expires between date of installation and date of abandonment. If it costs

$100, and has a scrap or salvage value of $10, depreciation totals $90, repairs excluded. If life is 9 years, average annual depreciation is $10. It is usually assumed that depreciation is thus evenly spread over the lifetime of the assets. The Interstate Commerce Commission makes this assumption in its railroad valuations. The regulations of the Bureau of Internal Revenue assume equal amounts of depreciation in equal periods of time, but permit use of other bases.

FINANCIAL NATURE OF DEPRECIATION.—Depreciation is the financial effect of deterioration, wear and tear, obsolescence and inadequacy. In a broad sense it includes also depletion of mines. Invested capital has two aspects, cost and value. Accounting, and therefore depreciation, deals with cost rather than value. Replacement allowances should be made on the basis of cost of the unit to be replaced, not on basis of exchange value or replacement cost. Sometimes it is proper, in case of newly organized concerns, to capitalize depreciation as a developmental cost. Depreciation is an expense, and has been repeatedly so held by courts and commissions. It is a cost of production and should be allocated to cost of output or service. It approximates to a fixed charge. It was definitely recognized as a cost of service by the U. S. Supreme Court in *Smyth* v. *Ames*.[2]

DEPRECIATION vs. REPAIRS.—Ordinarily, repairs and depreciation require different treatment, but they are closely related problems. If the reserve is credited with enough to provide only for original cost of the asset in question, repair costs should be charged to income. The problem is to draw the line between repairs and minor replacements chargeable to the reserve. If a **detailed plant ledger** is kept the problem solves itself; otherwise there is some difficulty in making the division. Also the depreciation rate is dependent to some extent on policy pursued in making repairs. The depreciation reserve equalizes cost of renewal of parts so extensive that to charge them to income would result in excessive deductions in some periods. The distinction has been drawn in numerous instances, but no definite rule can be formulated. If depreciation is figured by straight-line method, inclusion of renewals and replacements in repairs chargeable direct to Profit and Loss tends to make the depreciation reserve excessive. Care should be used to keep cost of all items whose renewal is charged to current operations out of the amount on which the reserve is reckoned.

DEPRECIATION vs. MAINTENANCE.—Maintenance secures daily efficiency but does not scientifically prevent impairment of total investment. This is accomplished by means of depreciation allowances based on a comprehensive plan. Maintenance cost ordinarily increases with advancing age of assets. It does not prevent a condition of overcapitalization resulting from a condition of normal depreciation. In *Pioneer Telegraph Co.* v. *Westenhaver*,[3] the Supreme Court of Oklahoma stated that current maintenance "represents only the cost of those units that had become so badly depreciated that they had to be replaced during that year," and found that 7% of "reproductive value" of physical property would be a proper annual allowance for depreciation.

DEPRECIATION ESTIMATED IN GROSS.—When it is decided to include repairs in depreciation, cost of repairs is deducted from total gross allowance each accounting period to determine the amount to be set up as a reserve. If, on a predetermined basis, gross depreciation for a given period

[2] 169 U. S. 466.
[3] 118 Pac. 354 (Jan. 10, 1911).

is fixed at $20,000, and during that month $11,000 is expended for repairs, $9,000 will be credited to the reserve. Entries are as follows:

Repairs	$11,000	
Cash		$11,000
For repairs made during month.		
Depreciation Expense	$ 9,000	
Reserve for Depreciation		$ 9,000

This plan possesses the advantage of providing an equal charge from month to month, but makes the amount reserved for depreciation dependent upon the amount expended currently for repairs, which is illogical. Consequently, there is no guaranty that cost will be amortized during lifetime of a given unit.

NORMAL DEPRECIATION.—If the depreciation reserves are properly set up, they express approximately the amount of normal depreciation existing at a given time.

SALVAGE AND SCRAP.—Salvage is the value an article possesses for some use other than that to which it has been devoted. When so used it possesses an additional **cycle of life.** Scrap value is what an article is worth if broken up.

SUPERSESSION.—Supersession consists in the replacement of an asset by one better adapted to perform its work.

EARNED DEPRECIATION.—Earned depreciation is depreciation for which compensation has been received through revenue. It may be retained in form of a fund or otherwise employed.

AMORTIZATION.—This word is used in several senses. It sometimes refers to the liquidation of a debt, especially by establishment of a sinking fund. It sometimes refers to the amount chargeable to expense due to expiration of leaseholds, amount so chargeable being proportionate to life expired during a given period. It sometimes refers to writing down of book figures to make them reflect actual conditions. It is sometimes used synonymously with depreciation.

CASUALTIES.—Casualties are industrial accidents, time of occurrence and cost being uncertain. Casualties result from floods, storms, explosions, and other fortuitous events. The Bureau of Internal Revenue includes casualties among its deductions allowable under the law for "losses sustained during the taxable year and not compensated by insurance or otherwise, if incurred in trade or business."

CYCLES OF LIFE.—A cycle of life is comprehended in the whole period of usefulness of an article in a given position. Second cycle of life determines salvage at end of first cycle.

DEFERRED MAINTENANCE.—Deferred maintenance is the measure of the neglect to make all ordinary repairs such as are necessary to keep a plant in good running condition. Ordinarily it is not reflected in the accounts, but it should be accounted for in the same way as other expenses. "Accrued repairs" may be given due consideration by charging current maintenance and crediting a deferred maintenance reserve. When repairs are made later on, they are charged to this reserve.

UNEARNED DEPRECIATION.—Unearned depreciation is similar in some respects to deferred maintenance. It is that depreciation which has been

incurred in giving service and for which no return through revenue has been received. From a purely accounting point of view it is equivalent to a deficit.

UNCOVERED DEPRECIATION.—Uncovered depreciation is like unearned depreciation, in that it is not reimbursed through revenue, but unlike it, in that it should not be so reimbursed, because it occurs in property not presently useful in serving the public. It arises only in connection with public utilities, and is the result of unwarranted investments.

AVERAGE LIFE.—Average life is time in years during which the depreciation of all parts amounts to original cost less salvage value. Assume case of a plant consisting of five units with original cost, estimated lives, and salvage values as follows:

Units	Original Cost	Estimated Life in Years	Salvage Value	Cost less Salvage
Unit 1...............	$ 1,000	5	$ 100	$ 900
" 2...............	5,000	10	1,000	4,000
" 3...............	20,000	15	2,000	18,000
" 4...............	30,000	20	5,000	25,000
" 5...............	50,000	23	4,000	46,000

The cost of depreciation each year for the several units is as follows:

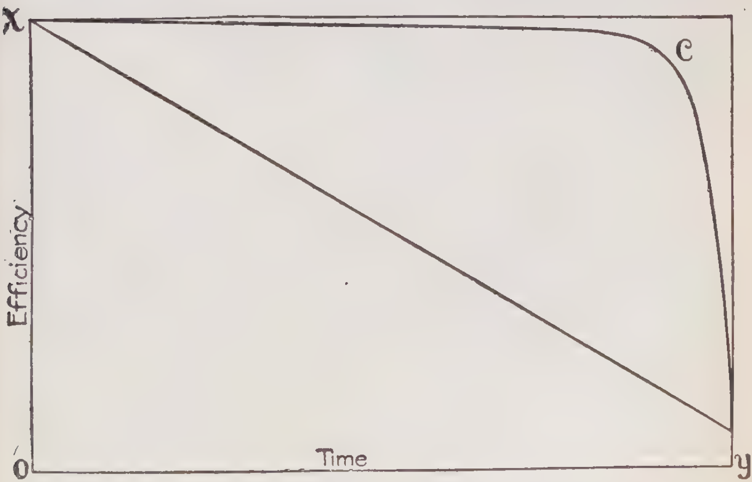
Units	Cost less Salvage		Estimated Life in Years		Cost per Year
Unit 1..............	$ 900	÷	5	=	$ 180
" 2..............	4,000	÷	10	=	400
" 3..............	18,000	÷	15	=	1,200
" 4..............	25,000	÷	20	=	1,250
" 5..............	46,000	÷	23	=	2,000
	$93,900	÷			$5,030=1866. yr.

Cost less salvage expires in 18.66 years, which is average life of the plant. This should not be confused with the average of the lives of the various units, which is 14.6 years, a figure of no special significance.

DEPRECIATION BASE.—By the "depreciation base" is meant the amount upon which the rate is computed. **For private industry** the base should ordinarily be the cost of the asset in question, because this is the amount to be returned through revenues. **In manufacturing industries** the depreciation base has a direct bearing upon price-making and competition. Its selection should be made with a view to its effect on costs. **In publicly regulated industry** its selection should be made with reference to interests of investors and the public. **Various bases** have received the support of courts and commissions, among these being cost, reproduction cost, and depreciable property. Some companies retain a percentage of gross revenue to cover depreciation or a larger percentage to cover both depreciation and maintenance. The objection to this method is that the amount retained bears no

relation to actual depreciation. The following table taken from Floy[4] shows the policy of companies:

Name of Company	Per Cent of Gross Revenue Expended or Appropriated for: Maintenance	Depreciation
Milwaukee companies:		
Railway departments	11.30	9.90
Gas, electric light, and steam heat departments	6.15	8.12
United Railways Co. of St. Louis	13.67	10.00
Union Electric Light & Power Co., St. Louis	4.95	16.00
Suburban Electric Light & Power Co.	7.10	10.85
Detroit Edison Co. and subsidiaries	6.45	10.23
Omaha & Council Bluffs Street Railway Co.	7.00	10.00
Chicago Street Railways	6.00	8.00
Philadelphia Rapid Transit Co.	Undivided	15.00



FORM 1. Curves Showing Progress of Uniform Depreciation and of Diminishing Efficiency

The New York Edison Co. bases its depreciation charge on kilowatt-hours output. Some street-car companies charge a certain amount for depreciation for each car-mile run. In Cleveland 5 cents per car-mile has been allowed to cover both maintenance and depreciation. In Brooklyn the subsidiaries of the Brooklyn Rapid Transit system have allowed a rate varying from 2.7 to 4.4 cents per car-mile for equipment of surface roads, and from 1.4 to 2

[4] Valuation of Public Utilities, p. 199.

cents per car-mile for equipment of elevated or partly elevated railways. In *Buffalo Gas Co.* v. *City of Buffalo*,[5] 5.3 cents were allowed on each 1,000 cubic feet of gas sold, on an assumed sale of 633,000 M. cubic feet.

DEPRECIATION AND EFFICIENCY.—Plant must be kept at a certain degree of efficiency sufficient to give satisfactory service. **Loss of efficiency** in plant as a whole is not proportionate to depreciation. Composite depreciation may be accompanied by little or no loss of efficiency. Buildings, etc., remain in unimpaired efficiency for years. **Efficiency** is the practical test of present effectiveness. It is only one factor in value, however. **Value** depends not only on present usefulness, but also upon the time during which such usefulness will continue. Form 1 represents the character of depreciation figured on a straight-line basis, also of efficiency, both curves applying to same asset. If distance from O to X represents efficiency of a new machine, or 100%, and distance from O to Y represents life of same machine, then line XY represents progress of theoretical straight-line depreciation, and curved line XCY represents decline in efficiency.

ACCOUNTING PRINCIPLES.—The same general principles apply to depreciation accounting as to other phases of accounting. Assume that the following balance sheet represents the condition of Company A, newly organized:

Balance Sheet of Company A, as at......

Factory Building	$100,000	Capital Stock	$160,000
Machinery	25,000		
Other Assets	35,000		
	$160,000		$160,000

The assets subject to depreciation are factory building and machinery. Assume the factory building will require replacement at end of 50 years, and machinery at end of 25 years. Annual depreciation is $2,000 for the building, and $1,000 for machinery. Management neglects to make allowance for depreciation, profit for 1st year is shown as $15,000, and this is distributed as dividends. Process is continued 25 years, when machinery requires replacing. Assuming that no essential changes have occurred in the balance sheet, that new machinery can be bought at same cost as the old cost, and ignoring salvage, management is faced with problem of securing $25,000 with which to buy machinery. "Other assets," amounting to $35,000, cannot be converted into cash because they are needed in present status. $25,000 is borrowed at 5% to make the replacement, after which the balance sheet appears thus:

Balance Sheet of Company A, as at......

Factory Building	$100,000	Capital Stock	$160,000
Machinery	25,000	Notes Payable	25,000
Other Assets	35,000		
Deficit	25,000		
	$185,000		$185,000

[5] 3 P. S. C., 2d D. N. Y., 553.

Failure to allow for depreciation of machinery has caused a deficit of $25,000; also a fixed charge of 5% on $25,000, or $1,250. A further deficit of $50,000 is hidden in the "Factory Building" account. After another 25 years, both building and machinery require replacement at a cost of $125,000. No reserves having been set up, the balance sheet appears as follows after this is done:

Balance Sheet of Company A, as at......

Factory Building	$100,000	Capital Stock	$160,000
Machinery	25,000	Notes Payable	150,000
Other Assets	35,000		
Deficit	150,000		
	$310,000		$310,000

There is now a deficit of $150,000, and a fixed charge of 5% on $150,000, or $7,500. Equity remaining is $10,000—all that is left of original investment of $160,000.

The correct depreciation policy will now be illustrated. In above illustration, at end of 1st year following entry is made in the journal:

Profit and Loss	$3,000	
Reserve for Depreciation of Building		$2,000
Reserve for Depreciation of Machinery		1,000
To charge Profit and Loss with the year's depreciation expense.		

These are termed "valuation reserves" because of their relation to the assets whose depreciation they measure. The charge is to a nominal account, while the credits are to real accounts. The purpose of these reserve accounts is to record accrued depreciation and make it possible to retain the assets at cost in the ledger. Under this policy, at the end of 25 years the balance sheet appears as follows:

Balance Sheet of Company A, as at......

Factory Building	$100,000	Capital Stock	$160,000
Machinery	25,000	Res. for Depr. of Bldg.	50,000
Other Assets	110,000	Res. for Depr. of Mach.	25,000
	$235,000		$235,000

The building has passed one-half its life and has depreciated $50,000. Machinery requires replacement. Either cash or other assets have been retained in sufficient amounts to make the replacement. Even if found desirable to borrow, the financial status will not be weakened. If $25,000 is borrowed the transactions are:

Cash	$25,000	
Notes Payable		$25,000
For loan to make replacement.		
Reserve for Depreciation of Machinery	$25,000	
Machinery		$25,000
To write off old machinery.		
Machinery	$25,000	
Cash		$25,000
For purchase of new machinery.		

The balance sheet now stands thus:

Balance Sheet of Company A, as at......

Factory Building	$100,000	Capital Stock	$160,000
Machinery	25,000	Res. for Depr. of Bldg.	50,000
Other Assets	110,000	Res. for Depr. of Mach.	00
		Notes Payable	25,000
	$235,000		$235,000

Note that loan is secured without causing a deficit. This is because old machinery was written off against its corresponding valuation reserve, whereas in the preceding illustration there was no reserve and it was necessary to write off old machinery against Capital account. Whether preferable to borrow or to retain sufficient cash to avoid borrowing, is a question of policy to be determined by circumstances. Preferably, the depreciation reserve is shown as a deduction from corresponding asset in the balance sheet, as follows:

Balance Sheet of Company A, as at......

Factory Building	$100,000		Capital Stock	$160,000
Less: Res. for Depr.	50,000	$50,000	Notes Payable	25,000
Machinery		25,000		
Other Assets		110,000		
		$185,000		$185,000

RESERVES vs. FUNDS.—The difference between reserves and funds is illustrated below:

Company *X* owns a factory building which cost $50,000 and possesses an estimated useful life of 30 years. Each year depreciation reserve is credited and depreciation expense charged with $1,000. At end of 1st year the balance sheet appears thus:

Balance Sheet of Company X, as at......

Factory Building	$ 50,000		Capital	$100,000
Less: Res. for Depr.	1,000	$ 49,000	Dividends Payable	2,000
Other Assets		53,000		
		$102,000		$102,000

Capital is preserved by this procedure, for had no depreciation charge been made the balance sheet would be:

BALANCE SHEET OF COMPANY X, AS AT......

Factory Building	$ 50,000	Capital	$100,000
Other Assets	53,000	Dividends Payable	3,000
	$103,000		$103,000

and after payment of dividends:

BALANCE SHEET OF COMPANY X, AS AT......

Factory Building	$ 50,000	Capital	$100,000
Other Assets	50,000		
	$100,000		$100,000

which makes no allowance for the depreciation which has accrued.

The essential step is the retention of sufficient funds by means of the depreciation charge. If these remain a part of the general funds, they are reinvested and perhaps give rise to no further consideration.

Depreciation funds may be created in accordance with the same formulas as are sinking funds. If equal instalments are allowed to accumulate at compound interest, the formula is as follows: v representing the amount to which the fund is to accumulate, r the rate of interest plus 1 and n the number of years to run:

(1)
$$x = \frac{v\ (r-1)}{r^n - 1}$$

Logarithms can be used to solve the formula if term of years is large, because of difficulty of raising r to the nth power by multiplication.

If interest is not added to principal, the amount of each instalment is determined thus:

(2)
$$x = \frac{v}{n}$$

In this formula, v is the sum accumulated after n years by paying equal instalments, x, into the fund.

Taking the simpler case first, if Company Y wishes to establish a replacement fund for a building costing $25,000, with an estimated life of 25 years, by application of formula (2) we find, ignoring salvage, the amount of each instalment to be $1,000, thus:

$$x = \frac{25{,}000}{25} = \$1{,}000$$

Assuming each year's depreciation amounts to $1,000, this is brought into books by this entry:

Profit and Loss (or Depreciation)	$1,000	
Reserve for Depreciation of Building		$1,000
For depreciation accrued.		

Having decided to establish a depreciation fund for replacement of the building, and having found a suitable manner in which to invest the $1,000, the following entry is made:

Depreciation Fund for Building	$1,000	
Cash		$1,000
For investment of cash in a depreciation fund.		

The balance sheet then appears:

Balance Sheet of Company Y, as at......

Buildings	$25,000	Capital	$50,000
Other Assets	25,000	Res. for Depr. of Bldg.	1,000
Depr. Fund for Bldg.	1,000		
	$51,000		$51,000

or, better still:

Balance Sheet of Company Y, as at......

Building	$25,000	Capital	$50,000
Less: Depr. Res.	1,000		
	$24,000		
Other Assets	25,000		
Depr. Fund for Bldg.	1,000		
	$50,000		$50,000

If no depreciation fund is established, the balance sheet stands thus:

Balance Sheet of Company Y, as at......

Building	$25,000	Capital	$50,000
Less: Res. for Depr.	1,000		
	$24,000		
Other Assets	26,000		
	$50,000		$50,000

When a depreciation fund is carried, at expiration of 25 years the depreciation reserve has grown in amount equal to original cost of the building, and replacement is shown by following entries:

Cash	$25,000	
Depreciation Fund for Building		$25,000
For sale of depreciation fund investments.		
Building	$25,000	
Cash		$25,000
For construction of new building.		

Although an equal degree of simplicity is not possible in practice, the principles apply subject to adjustments for salvage, variations from anticipated life of assets, etc.

INTEREST AS A FACTOR.—If interest is added to principal in computing the fund, the computation is more complicated. Suppose Company Y possesses a building the cost of which is $100,000, and estimated life 10 years. A replacement fund is to be established to accumulate at compound interest, 4% being the assumed rate. Applying formula (1), the annual instalment is found thus:

$$x = \$100{,}000 \times \frac{1.04 - 1}{1.04^{10} - 1} = \$8{,}329.09$$

which is carried to the depreciation fund by the same procedure as in preceding illustration. As interest is received on investments in the depreciation fund, it is suitably invested, following entries being necessary to bring the transaction into the books:

Cash	\$......	
Reserve for Depreciation		\$........
Being interest received on depreciation reserve investments.		
Depreciation Fund for Machine	\$......	
Cash		\$........
To record transfer of cash to the special depreciation fund for machine.		

TERMINOLOGY.—Terminology may be altered from that used in the foregoing explanation without changing the principle involved. Thus, in railroad accounting the depreciation reserve is technically known as "Reserve for Accrued Depreciation," and in the balance sheet it is deducted from "Road and Equipment." Under the Uniform System of Accounts for Telephone Companies presented by the Interstate Commerce Commission, "Depreciation of Plant and Equipment" is charged and "Reserve for Accrued Depreciation" credited for amount of depreciation accruing on tangible fixed capital, while in the accounts prescribed by the Interstate Commerce Commission for gas and electric corporations in the District of Columbia, "General Amortization" is charged and "Accrued Amortization of Capital" is the reserve or credit account.

ADVISABILITY OF CREATING FUNDS.—It may not be desirable to accumulate depreciation funds. As a general rule, specific funds are not necessary. The Interstate Commerce Commission rejects the use of depreciation funds for railroad accounting, although it considers them useful under some conditions. Character of plant determines method of financing renewals and replacements. Sometimes, in making extensions to property there is no objection to borrowing money temporarily from the depreciation fund. This should, of course, be returned to the fund when money intended for the extensions is secured.

A STUDY OF BALANCE SHEETS.—Balance sheets in recent reports of large American corporations show great lack of uniformity in management of reserves and funds. A fair proportion show reserves either as liabilities or as deductions from assets. Few indicate special funds, except sinking funds for redemption of bonded indebtedness. U. S. Steel Corp. balance sheet has an account on the asset side entitled "Sinking and Reserve Fund Assets." Philadelphia Rapid Transit Co. balance sheet shows "Reserve Fund for Renewals" on asset side, and on liability side, of equal amount, "Renewal Reserve." Balance sheet of Third Avenue Railway Co. has an account on asset side entitled "Deposit for Depreciation, Renewals, and Contingencies," and on liability side, "Reserve for Depreciation, Renewals, and Contingencies." Pittsburgh Brewing Co. has a "Plant Sinking Fund" among the assets.

Sinking funds receive equally diversified names. International Paper Co.

has "Sinking Fund Accounts"; United Gas Improvement Co., "Sinking Fund Securities"; Interborough Rapid Transit Co., "Sinking Fund on 5 Per Cent, 45-Year Gold Mortgage Bonds"; Bethlehem Steel Corp., "Special Funds in Hands of Trustees for Redemption of Mortgages."

The following companies indicate the depreciation reserve on right-hand side: Philadelphia Rapid Transit Co., Third Avenue Railway Co., Interborough Rapid Transit Co., and Bethlehem Steel Corp.

Sears, Roebuck & Co. and Lehigh Valley Railroad Co. show the reserve as a deduction from assets. Report of Wells, Fargo & Co. as of June 30, 1912, indicates "Reserve for Accrued Depreciation" deducted from property and equipment account, whereas the report for the preceding year lists it on the liability side.

Utah Copper Co. balance sheet shows an account on liability side entitled "Appropriated Surplus—Sinking Fund." Balance sheets of William Cramp & Sons, Baldwin Locomotive Works, International Harvester Co., General Electric Co., and American Tobacco Co., indicate neither reserves nor funds of any kind.

THE PLANT LEDGER.—The setting up of a plant ledger should be preceded by an **analysis of plant** into significant **units.** A unit may be a building, 20 locomotives of the same type, a steamboat, etc. Question is always one of expediency determined upon actual conditions. Following **rules** may be of assistance:

1. A unit of plant cannot be made up of unlike things, or things having different functions.
2. For the sake of the saving in calculations, a unit should include as many items as possible capable of being handled together.
3. A number of things may be handled together as a unit if they have the same general physical makeup, are employed for the same purpose, and, what would be ordinarily inferred from the foregoing, have approximately the same lifetime.

Analysis of plant is illustrated as follows:[6]

Table A. Subdivision of Cost of Industrial Plant

		Proportional Cost %
I. Plant:		
(a) Riparian rights for dam and flowage basin, real estate expenses, organization expenses, preliminary legal expenses, cost of financing, removal of railroads, highways, bridges, and all expenses preliminary to actual construction of work......		20
(b) Permanent construction, dam, power-house, and waterways, etc.		30
(c) Transmission system:		
(1) Right of way..........................	4.5	
(2) Copper..............................	1.5	
(3) All else..............................	7.0	13

[6] The data on hydroelectric plant used in this section are taken from the discussions of Calvert Townley and Dr. Cary T. Hutchinson, before the American Institute of Electrical Engineers, Dec. 1909.

II. Equipment:	
(a) Equipment of power-house	14
III. Capitalized General Expenditures:	
(a) General expense, engineering administration, legal, etc.	11
(b) Interest during construction	12
	100

Of these items, only I(b), I(c), and II(a), comprising 57% of entire cost of the plant, are subject to depreciation; and of item I(b), a large part does not depreciate to any appreciable degree from physical causes, since it covers rock excavation and concrete.

Table A indicates **proportional cost** of the main subdivisions of the plant. Thus, cost of equipment is 14%, and of transmission system 13%, of total cost of plant. Tables B and C indicate what percentage cost of different units of equipment and transmission system is of total cost of equipment and transmission system, respectively.

Analysis of Transmission System.—For illustrative purposes attention will be confined to items I(c) and II(a), since they serve to indicate effects of both functional and physical depreciation. The following table classifies units of transmission system—I(c)—indicating proportional cost of units and lifetime in years. In this connection, by "unit" is meant one, or more than one, item of plant, as already explained.

Table B. Cost and Lifetime of Transmission System

1. Transmission Line

		Proportional Cost %	Life in Years
I-c-1	Right of way	45.0	..
I-c-2	Towers	18.4	15
I-c-3	Special structures	5.1	10
I-c-4	Insulators	2.1	10
I-c-5	Copper	23.7	25
I-c-6	Installation	5.7	..
		100.0	

2. Substations

		Proportional Cost %	Life in Years
I-c-7	Land	6	..
I-c-8	Buildings	30	25
I-c-9	Transformers	40	20
I-c-10	Switches, etc.	16	10
I-c-11	Installation	8	..
		100	

Analysis of Power-House Equipment.—The equipment of power-house is classified in the following table:

Table C. Cost and Lifetime of Power-House Equipment

		Proportional Cost %	Life in Years
II-a-1	Stop logs, gates, and other wood exposed to air and water	0.80	5
II-a-2	Flooring, roofing, hardware, and miscellaneous fixtures	9.80	15
II-a-3	Tile wainscoting, sewage, plumbing system, metal window-frames, etc.	2.45	15
II-a-4	Electric light and telephone	0.80	10
II-a-5	Switchboard equipment	4.35	10
II-a-6	Cables and heavy wiring	3.90	10
II-a-7	Cranes	1.25	15
II-a-8	Water-wheels	33.75	25
II-a-9	Water-wheel governors	2.90	10
II-a-10	Generators and transformers	40.00	25
		100.00	

If cost of entire plant is known, cost of any unit can be derived by finding what percentage the chief subdivision of which the unit forms a part, is of cost of plant, and taking this percentage of entire cost of plant. When value of chief subdivision is thus found, the value of the unit may be determined by finding what percentage the unit is of the chief subdivision.

To illustrate, if cost of entire plant is $100,000, then cost of power-house equipment is 14% of that amount, or $14,000, and cost of any of units composing power-house may be found by multiplying $14,000 by the percentage of cost of equipment represented by it. Thus, cost of water-wheels is .3375 of $14,000, or $4,725. These percentages must, of course, be based upon actual cost of the properties.

Character and Use of Plant Ledger.—The plant ledger should be made an essential part of the double-entry books, and be controlled by a Plant account in the general ledger, with which it must be in agreement. The form and arrangement of the plant ledger should be such as to combine brevity, accuracy, and compactness with necessary detail. It should afford a complete record of the life of each unit or class of units of the plant.[7]

The plant or property ledger must show not only original investment in a unit of plant, but also in all additional units of a like character afterwards purchased. It must show losses sustained each year on all wasting assets and their resultant diminished value. If desirable, the month may be made the time basis for figuring depreciation, but in most cases the yearly basis is sufficiently accurate. The plant ledger should be so arranged that all needed adjustments, either to show effect of functional depreciation, or of unanticipated shortening or lengthening of a unit's life, can be made.

---

[7] The Bureau of Internal Revenue prescribes that in charging off depreciation: "The allowances should be computed and charged off with express reference to specific items, units, or groups of property, each item or unit being considered separately or specifically included in a group with others to which the same factors apply. The taxpayer should keep such records as to each item or unit of depreciable property as will permit the ready verification of the factors used in computing the allowance for each year for each item, unit, or group." (Reg. 62, Art. 169.)

A **loose-leaf book** is most suitable for the plant ledger, because it is unnecessary to carry in it more sheets than needed for current work. Form 2 represents a page of the plant ledger. An explanation of the data entered in this form is given below.

In the plant ledger the pages or sheets used for the record of any unit or class of units should be numbered consecutively. Name of the unit appears in upper left-hand corner. Year of installation of a new unit, or of adjustment of an old one, appears in the first column. In case of an old plant it indicates year plant ledger was installed. In next column is entered the estimated life (or remaining life) of unit; and in third column its value at time of installation. In remaining columns annual depreciation allowances are distributed, their total equaling cost or adjusted value of the unit, as given in column three; the element of scrap value not being taken into consideration.

The first distribution column of any particular unit should correspond in date with the year of installation of the property. Approximate accuracy will be secured if for 1st year the distribution allowance be calculated as one-half that of a full year, since installations will be fairly well scattered through it, some going into operation early, others late, in the year.

If a number of items of a class are installed at different times during the year, or if there is uncertainty as to whether installations for the year in any particular class are completed, an auxiliary blank should be used from which at the close of the year a recapitulation can be made and total installation entered in plant ledger. In this way one line serves for each year's installations of any class, and work of computing annual allowances and possible future adjustments is reduced to a minimum.

To illustrate **working of the plant ledger,** take the hydroelectric plant analyzed in the preceding pages, assuming its total investment value to be $100,000, and selecting one of its units. For example, take item 9 of powerhouse equipment, "water-wheel governors," having an estimated life of 10 years, and comprising 2.9% of value of the equipment, or $406. Assuming installation to have been made in 1912, entry for it in the plant ledger is shown in Form 2. As but one-half of a full year's depreciation occurs in year of installation, distribution of depreciation will extend over 11 columns in the ledger, a similar half-year's charge being made in the 11th column, or for 1922.

If no additional installations are made, if functional depreciation does not diminish value more rapidly than physical depreciation, and if our estimate of the unit's lifetime has been correct, or nearly correct, no adjustments will be required except annual deduction of depreciation allowance from balance brought forward from previous year. In such a case the record of this unit, when it has become worn out, appears in Form 2.

Adjustments may be required at times, during lifetime of the unit for either of two reasons: first, obsolescence or inadequacy may so impair functional value of the unit that its investment value drops below what the plant ledger indicates; secondly, with passage of time, it may be found that lifetime of the unit was incorrectly estimated, necessitating distribution of its remaining value on a new basis.

Property Ledger Advocated by U. S. Chamber of Commerce.—Following is an abstract on the use of the property or plant ledger, as advocated by the Fabricated Production Department of the U. S. Chamber of Commerce:

A **proper record of depreciation** requires that specific items and units of property be enumerated and classified by kind, group or department, and that their original cost be ascertained, as well as accumulated depreciation and remaining useful life.

PLANT LEDGER

Sheet No. ______

Unit Name or Number Water wheel Governors.

FORM 2. Plant Ledger showing Distribution of Depreciation

To do this is not easy for an established concern accustomed to taking depreciation on a general grouping of property, such as Buildings or Machinery. For such a concern "the splitting up and allocation of the old capital outlay must be approximate." Such allocation will be greatly assisted by a competently made appraisal.

A **complete record and history of depreciation** as well as of plant and equipment can be secured through the property ledger. This aims to do for plant and equipment what the perpetual inventory record does for stock on hand.

Such a property ledger ties up with the general books of account and supplies detail for total cost of property; depreciation written off in any year; additions, renewals, and disposition of property; amount in depreciation reserves; estimated scrap value; and net remaining sound value of property.

In addition, the property ledger will contain a brief description of all property; where located, plant identification; name of manufacturer and manufacturer's number; from whom and when purchased; total cost, including freight and installation charges; estimated useful life of equipment and rate of depreciation; and it may likewise have a record of repairs, replacement values, and a tabulation of monthly depreciation.

The property ledger can be compiled in **card** or **loose-leaf form.** Each card or sheet ought to last from 20 to 30 years. Practically the same form can be used for departmental and final summaries of plant and depreciation. The complete financial, plant, and performance history of each item of property secured in this way guides future outlays upon plant, helps the accurate determination of loss or gain on specific assets, is of some importance in credit applications, simplifies compiling and checking of tax and annual statements, and is invaluable in event of fire loss. The surprising thing is that there is still a comparatively large number of concerns operating without such a property ledger.

Arrangement of the form of property ledgér as well as its size, etc., depends on ingenuity of the executive or cost accountant designing it, as well as on his sense of what is important information for his particular requirements, industry or plant. It may be desired to compress all the information on a small card, using both sides, or it may be considered wise to keep track of monthly depreciation, the cost of repairs or replacement values. These are details to be adjusted to and by individual needs.

To illustrate (Form 3) the use of the property ledger, it is supposed that a 50 h.p. steam engine is purchased from Evans & Clark for use in the trimming department. SE-T1798 is its plant number, SE—symbol for steam engine, T for trimming department. This plant number appears on name plate of machine where it can be easily seen. If the asset is frequently moved about the plant, it will be given a location number. The manufacturer is the Brighton Engine Co., the manufacturer's number B-93217. Its useful life has been determined at 15 years. Invoice for the engine comes to $2,500, freight charges $15, installation $185, a total cost as of Jan. 1, 1921, of $2,700. Scrap value is computed at $150, leaving a wearing value of $2,550, and an annual depreciation of $170 arrived at by dividing wearing value by useful life of 15 years.

The record of the engine is as follows:

1921. Normal depreciation of $170, no additions, no renewals. At end of year there will be $170 in depreciation reserve and a net remaining value of $2,380. (Wearing value $2,550 less depreciation reserve $170.)

1922. Normal depreciation of $170, no additions, no renewals. At end of year there will be $340 in depreciation reserve and a net remaining value of $2,210.

1923. Normal depreciation of $170, no renewals, an addition in the way of a lubricator, installed Oct. 8, at cost of $150. At end of year there will be $510 in depreciation reserve and a remaining value of $2,190. (Former wearing value of $2,550 has been increased $150 to $2,700, by cost of lubricator; $2,700 less $510 in depreciation reserve, leaves a net wearing value of $2,190.)

1924. Normal depreciation has been increased to $182.50. This is arrived at by dividing new remaining value $2,190 by remaining useful life of 12 years. No additions, no renewals. There is accordingly at end of year $692.50 in depreciation reserve, and a net remaining value of $2,007.50.

1925. Normal depreciation of $182.50. Other things being equal, there would accordingly be $875 in depreciation reserve at end of year, and a net remaining value of $1,825, but on July 12 old piston has been replaced by a new one costing $300. This $300 is charged against accumulated depreciation, reducing that to $575, and increasing remaining value by just that much to $2,125.

ITEM Engine	MANUFACTURER Brighton Engine Co	USEFUL LIFE ~~15 Years~~

1927 Jan.	10	Engine sold - $2000. loss $97.92							

FORM 3. Form of Plant Ledger suggested by U S Chamber of Commerce

1926. At Jan. 1, 1926, the asset has been in use 5 years. Its remaining useful life will accordingly be 10 years, but the replaced piston, etc., it is assumed, prolongs useful life 2 years, and remaining useful life of asset is correspondingly changed to 12. This remaining useful life, 12 years, divided into remaining value, $2,125, gives a new annual depreciation charge of $177.08. At close of year, depreciation in reserve will amount to $752.08, and remaining value $1,947.92.

1927. On Jan. 10 the machine sold for $2,000. On proper page of journal an entry corresponding to the following will appear:

Cash	$2,000.00	
Reserve for Depreciation	752.08	
Profit and Loss	97.92	
Buildings (or Engine)		$2,850

Sales price, $2,000, plus accumulated depreciation, $752.08, $2,752.08, deducted from total cost $2,850 indicates loss of $97.92 on transaction.

A notation can be written in red ink across face of property ledger page, or items of cost, scrap and wearing value, depreciation reserve and remaining value closed out. At all events, the page will be taken out and filed in rear of ledger.

This hypothetical history is given to show how the property ledger operates and by what manner of contingencies it is affected.

RELATION OF DEPRECIATION TO COST ACCOUNTING.—Substitution of machinery for labor makes depreciation an increasing item of cost of manufacture. Depreciation is an element of overhead or burden, which is consequently increased. The **elements of cost** are:

1. Raw Materials
2. Expense of Manufacture:
   (a) Direct Labor
   (b) Overhead or Burden

The problem is to allocate depreciation to cost of output. When it is neglected it leads to serious consequences, because it is sometimes as much as 10% per annum of entire cost of buildings, machinery, and equipment. All well-organized factories are divided into departments whose functions are determined by a study of the manufacturing process. The department serves as a basis for the allocation of overhead. In so far as possible, all elements of overhead must be compiled on a departmental basis. **Productive departments** work directly on the product manufactured. **Non-productive departments** aid the productive process indirectly by supplying to productive departments materials and services required for their work. Costs which cannot be carried directly to productive departments must be allocated to them on some equitable basis. The following are **suggested bases**:

Account	Basis of Distribution
Insurance—Building	Floor space
Insurance—Merchandise	Value of property
Repairs on Building	Floor space
Depreciation of Building	Floor space
Taxes on Building	Floor space
Light	Candle-power required
Heat	Cubic feet of space
Salaries of General Officers	Net sales
General Administrative Expense	Net sales
Bad Debts	Net sales

Extent to which depreciation charges can be allocated directly depends on extent to which equipment is itemized for depreciation purposes. If depreciation charge for entire plant is calculated on total valuation of plant and equipment, the depreciation burden for departments must be allocated similarly to other general factory costs. It is desirable to segregate machinery and equipment by departments as a first step towards scientific calculation of depreciation costs and their allocation to cost of output. As much as possible of depreciation should be made a **direct departmental expense.** Nicholson suggests application of depreciation charges to departments on basis of total valuation of equipment in cash; but it is necessary to distinguish between property which is strictly departmental and property intended to promote welfare of plant as a whole. **Total overhead** for each productive department consists of: (1) direct departmental overhead, and (2) indirect departmental overhead—which latter consists of: (a) general factory overhead secured when general operating expenses are allocated to all departments productive and non-productive, and (b) costs of operating non-productive departments, which are allocated to productive departments after general operating expenses have been distributed to all departments, as in (a).

OVERTIME AND IDLE TIME.—Overtime causes some increase in the depreciation rate. Idle time may likewise tend to decrease the rate. During the war the Bureau of Aircraft Production prescribed the following yearly rates as a basis for monthly payments on a cost-plus basis to contractors operating two or more shifts per day:

	1 Shift %	2 Shifts %	3 Shifts %
Main buildings, brick and concrete	2½	3	4
Substantial wooden buildings	5	6	7
Factory equipment	10	12½	15
Electric equipment	12½	15	18
Heating and melting furnaces	6	8	9
Machinery	7½	10	12
Furniture and fixtures	10	12½	15

Rates in first column are for an 8-hour day. Rates for overtime were based on abnormal war conditions. Overtime affords less opportunity than usual for repairs and replacement. When there are two or more shifts, machines operate under different individuals. Each leaves minor matters of adjustment to his successor. Night-work is harder on machines than day-work. Taking on new labor dilutes labor efficiency. A constantly driven machine is affected by "mechanical fatigue."

The following table expresses the view of the auditor of a large American steel company. It is based on a normal day of 8 hours.

8	hours	—normal depreciation	
9	"	5%	of normal depreciation, additional
10	"	10%	" " " "
11	"	15%	" " " "
12	"	20%	" " " "
13	"	25%	" " " "
14	"	30%	" " " "
15	"	40%	" " " "
16	"	50%	" " " "
17	"	60%	" " " "

18 hours	70%	of normal	depreciation,	additional
19 "	80%	"	"	"	"
20 "	90%	"	"	"	"
21 "	100%	"	"	"	"
22 "	115%	"	"	"	"
23 "	130%	"	"	"	"
24 "	150%	"	"	"	"

The following **qualifying remarks** are made by the advocate of the above rates:

We feel that in fairness to all, after a normal rate of depreciation has been established the allowance for overtime depreciation should exclude the element of obsolescence. This would mean that the allowance for overtime depreciation *up to a certain point* would not increase in the same ratio as the number of hours. In other words, we consider that the factor of obsolescence would be constant, and the only varying element would be the actual depreciation due to wear and tear. The "certain point" referred to above should be 16 hours. After this point, we consider depreciation takes place very rapidly and we feel that in the above table the conditions are truly presented.

We think, furthermore, that it would be an injustice not to consider that the auxiliary departments of a plant should be subject to overtime depreciation. By this is meant such departments as steam, power, water, transportation, etc. Obviously, a "speed-up" program is felt in every department in the plant. It is conceded that these departments do ordinarily work 24 hours a day, but it is only in a measure. Under normal conditions they are working at full capacity only a fractional part of a day, and it was on this basis that normal depreciation was figured. If, however, it is required that these plants be run at full capacity for a greater than their normal time, it cannot be denied that there is additional depreciation.

We feel that the application of overtime depreciation will necessitate the determination of normal depreciation for each department in the plant. Furthermore, the determination of the number of hours a department is working overtime, unless treated in a broad way, might resolve itself into a complicated problem. Not knowing the attitude that will be taken in this respect, we hesitate in offering any suggestions.

Nicholson suggests the following rates:

11 hours—add	5%	of	the	normal	rate
12 " "	10%	"	"	"	"
13 " "	15%	"	"	"	"
14 " "	20%	"	"	"	"
15 " "	25%	"	"	"	"
16 " "	30%	"	"	"	"
17 " "	35%	"	"	"	"
18 " "	40%	"	"	"	"
19 " "	45%	"	"	"	"
20 " "	50%	"	"	"	"
21 " "	57½%	"	"	"	"
22 " "	67½%	"	"	"	"
23 " "	80%	"	"	"	"
24 " "	95%	"	"	"	"

ALLOCATION OF DEPRECIATION ILLUSTRATED.—Assume that a factory consists of four departments, A, B, C, and D. General plant depreciation applicable to the manufacturing process is $2,000 monthly. In addition, depreciation costs which can be determined on a departmental basis are as follows per month:

Department A	$500
Department B	800
Department C	350
Department D	600

These figures are found by proper computations based on data presented in the plant ledger.

It is necessary to fix upon some plan of allocating general factory depreciation to departments. If allocation is to be made on basis of floor space, we may assume that the floor space for the departments is:

	Sq. ft.
Department A	20,000
Department B	40,000
Department C	15,000
Department D	25,000
	100,000

The amounts chargeable to departments are as follows:

Department A, 20% of $2,000, or	$ 400
Department B, 40% of 2,000, or	800
Department C, 15% of 2,000, or	300
Department D, 25% of 2,000, or	500
	$2,000

The total depreciation cost per month for each department is, therefore as follows:

	Departmental		General	Total
Department A	$ 500	plus	$ 400	$ 900
Department B	800	"	800	1,600
Department C	350	"	300	650
Department D	600	"	500	1,100
	$2,250		$2,000	$4,250

Each manufacturing department is thus charged with its total depreciation burden and must make the proper distribution to its orders in process during the given month. In the financial records this depreciation expense represents a charge to Manufacturing and a credit to the Depreciation Reserve account, as follows:

Manufacturing	$4,250	
Reserve for Depreciation		$4,250
To represent the month's depreciation cost chargeable to goods manufactured as one of the costs of manufacture.		

The Manufacturing account controls the cost ledger, so that the same amount is distributed over the order numbers whose records are shown in the cost ledger. It may be that the depreciation cost will not appear as a separate item on the cost sheets because it may be merged with other items of indirect cost, the total being shown in the form of a machine rate, or as a percentage of prime cost.

The manner in which each department makes the distribution of its quota of depreciation expense to jobs or order numbers depends upon the method of allocation of burden or overhead employed. If the **machine rate method** is in use the depreciation expense is combined with other indirect applicable to the department and the total indirect is allocated to machines or production centers and serves as the basis for the determination of a machine-hour rate which will be sufficient to exhaust the total month's overhead applicable to such machine or production center in a month's time.

To illustrate, assume that the total number of machine hours for a given machine, running full time, is 360 for a given month, and that the total indirect applicable to that machine is estimated to be \$720 for that month. Its rate per hour is, therefore, \$720 ÷ 360, or \$2. But if idle time for the month for this machine amounts to 60 hours, the unapplied portion of the estimated burden will amount to \$2 × 60, or \$120. Further, let us assume that in due time the actual indirect for this month is ascertained to be \$780, or \$60 in excess of the estimated indirect. To simplify matters for illustrative purposes, assume further that the machine's time during the month has been occupied exclusively upon four order numbers. Below is shown the appearance of the account for indirect and also the cost ledger accounts for the four orders, after the indirect has been distributed, first by the direct rate, secondly, by the first supplementary rate, and, thirdly, by the second supplementary rate:

General Ledger

Indirect, Dept. A

Actual Indirect	\$780	Direct Rate	\$600
		1st Supplementary	120
		2nd Supplementary	60
	\$780		\$780

Cost Ledger

Order No. 230 (70 hrs.)

Direct Rate	\$140		
1st Supplementary	28		
2nd Supplementary	14		

Order No. 231 (100 hrs.)

Direct Rate	\$200		
1st Supplementary	40		
2nd Supplementary	20		

ORDER NO. 232 (70 HRS.)

Direct Rate	$140
1st Supplementary	28
2nd Supplementary	14

ORDER NO. 233 (60 HRS.)

Direct Rate	$120
1st Supplementary	24
2nd Supplementary	12

The hours indicated within the parentheses are the actual number of hours spent by the machine on the different orders. The "direct rate" charge is made on the supposition that the machine operates full time. The "1st supplementary" charge distributes the balance of estimated indirect resulting from idle time. The "2nd supplementary" charge distributes the excess of the actual over the estimated indirect. The "1st supplementary" rate is secured by dividing the unapplied burden resulting from idle time, $120, by the number of operating machine hours for the month, 300, which gives, as the first supplementary rate per hour, $0.40. The "2nd supplementary" rate is secured by dividing the excess of the actual indirect over the estimated indirect, $60, by the number of operating machine hours for the month, 300, which gives as the second supplementary rate per hour, $0.20. The various distributions are shown in the above accounts.

The amounts credited to the accounts for departmental indirect, in the general ledger, are in turn charged to Manufacturing account, which may also be a departmental account in the general ledger.

Methods of Depreciation

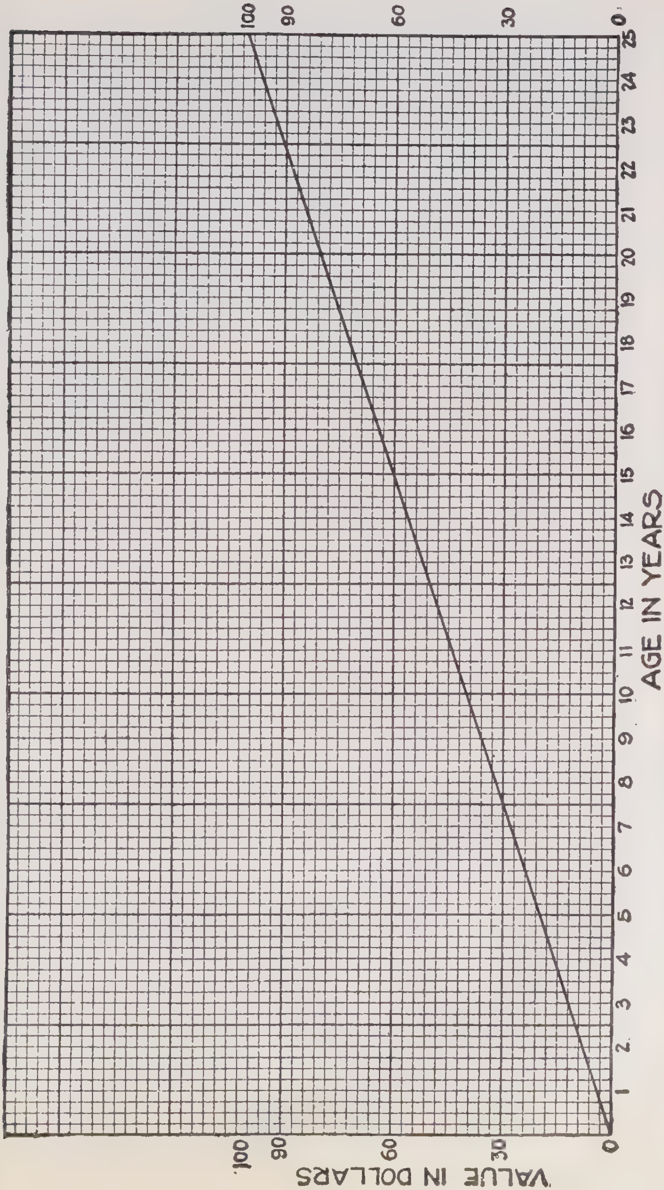
STRAIGHT-LINE METHOD.—This is the simplest and most widely employed. It does not require any complicated mathematical computations. If V represents the investment, n lifetime in periods, and V' salvage value, then x the periodic charge is:

$$x = \frac{V - V'}{n}$$

Assume case of a plant costing $100 with a life of 25 years and a salvage value of zero.

$$x = \frac{\$100}{25} = \$4$$

Table 1 shows the accumulations of the charges made on this basis; also reduced theoretical value of remaining investment at end of each year. These results are shown plotted on Form 4.



Form 4. Graphic Illustration of Depreciation—Straight-Line Method
(Plotted from data in Table 1.)

Table 1. Straight-Line Method

TABLE OF COMPUTATIONS

Age in Years	Value at End of Each Year	Depreciation During Year	Total Accrued Depreciation at End of Each Year
0	$100		
1	96	$4	$ 4
2	92	4	8
3	88	4	12
4	84	4	16
5	80	4	20
6	76	4	24
7	72	4	28
8	68	4	32
9	64	4	36
10	60	4	40
11	56	4	44
12	52	4	48
13	48	4	52
14	44	4	56
15	40	4	60
16	36	4	64
17	32	4	68
18	28	4	72
19	24	4	76
20	20	4	80
21	16	4	84
22	12	4	88
23	8	4	92
24	4	4	96
25	0	4	100
		$100	

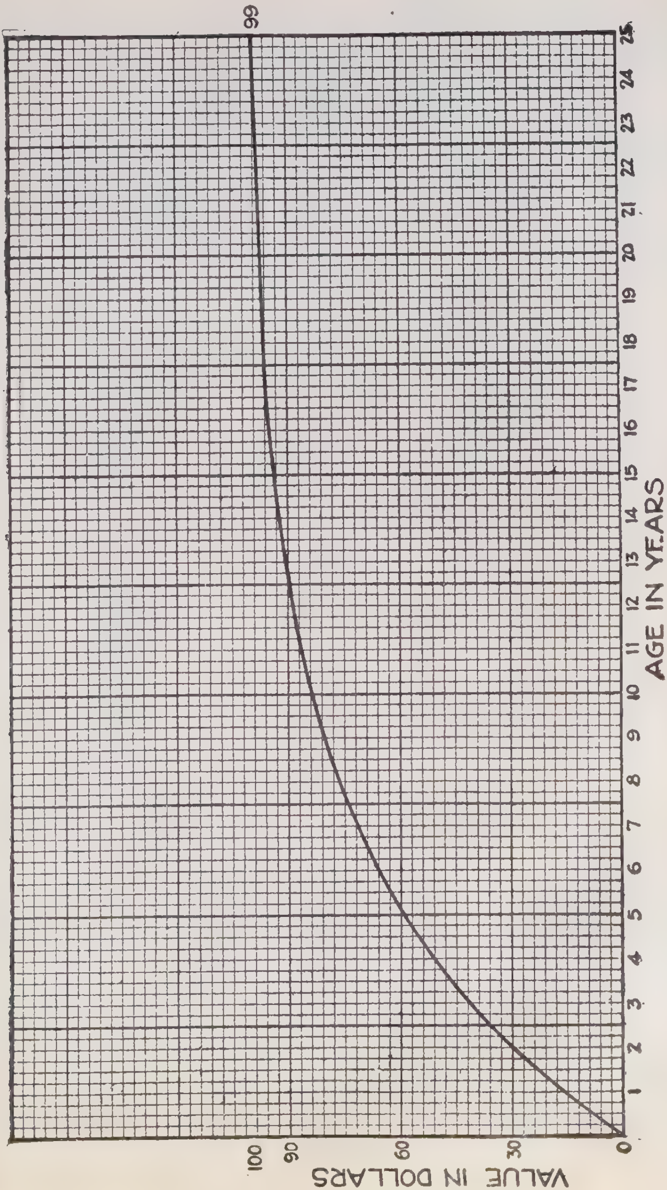
REDUCING BALANCE METHOD.—This method requires heavy charges during early years of a unit's lifetime, which continually decrease in amount from year to year. Since repairs and renewals cost least during early years, they offset to some extent this inequality and tend to make total cost of upkeep and depreciation somewhat uniform.

A **constant percentage** on the decreasing balance is charged off, beginning with the original investment and reducing it to zero. If V' represents salvage, V original investment, n the number of periods, and x the constant percentage of the balance necessary to reduce it to the required minimum or salvage in the given time, then:

$$x = 1 - \sqrt[n]{\frac{V'}{V}}$$

An asset costs $100 and depreciates in 25 years to $1. Applying the formula,

$$x = 1 - \sqrt[25]{\frac{1}{100}} = .168236$$



FORM 5. Reducing Balance Curve
(Plotted from data in first and last columns of Table 2.)

The balance must be reduced each year 16.8236%. Table 2 shows the tabulation of items over the 25-year period. These results are shown plotted in Form 5.

Table 2. Reducing Balance Method

TABLE OF COMPUTATIONS

Age in Years	The Reduced Balance	Depreciation for Each Year	Amount of Depreciation from Beginning to End of Each Year
0	$100.0000	$16.8236	$16.8236

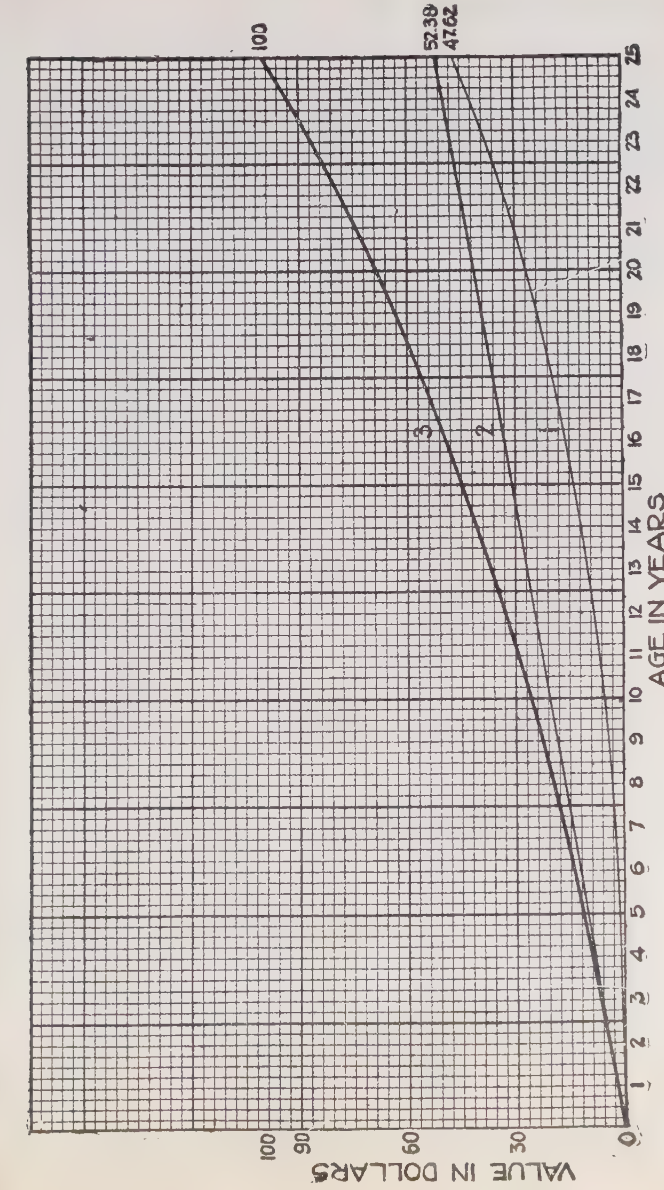
SINKING FUND METHOD.—This method employs the principles ordinarily used in establishment of sinking funds. The rate of depreciation is made a **function of an interest rate** and is purely theoretical. A fixed sum of money is set aside each period to accumulate at compound interest. Amounts thus set aside plus interest accumulations should equal the desired amount at end of life of asset in question. Although annual charges remain constant, actual burden increases each period, because in addition to equal amounts placed in fund periodically, there are constantly increasing interest accumulations. These represent the earning capacity of the fund and are not received through the usual channels of revenue as would happen were they reinvested in the business. If V equals fund to be accumulated in n



FORM 6. Sinking Fund Curves
(Plotted from data in Table 3.)

periods by investing x dollars, in a fund to accumulate at r rate of interest, then:

$$x = \frac{V(r-1)}{r^n - 1}$$

Assume case of a plant valued at \$100, life 25 years, salvage zero. A sum of money is to be set aside each year so that in 25 years the fund will accumulate to \$100 at 5%, compounded annually.

$$x = \frac{\$100(1.05 - 1)}{1.05^{25} - 1} = \$2.0952+$$

Table 3 shows these results tabulated. The data are plotted in Form 6.

Form 7. Annuity Curves
(Plotted from data in Table 4.)

ANNUITY METHOD.—Under this method an allowance is made for interest on the investment remaining at the beginning of each period. It proceeds on the assumption that interest on the remaining investment should be allowed for in the revenues; also that annual allowances should be equal. The **equal annual charge** is determined without assumption of a depreciation rate, by finding such a sum as, when deducted each year from sum of remaining investment and interest thereon at a given rate, will write down the investment to salvage, or zero, and also return full amount of interest on investment as it stands from beginning to end of the plant's life. Interest for first year is on original investment; for second year, on original investment reduced by the amount that total annual allowance for interest and depreciation is in excess of interest on investment for first year. That part of the allowance covering item of interest gradually diminishes. That part covering depreciation correspondingly increases. The two combined are always the same. The **controlling factor** is the rate of interest on the investment. As the rate is lowered, this method approaches the straight-line method, being identical with it when interest is zero.

		$77.3800	$100.0000	$177.3800

Let V be original value, V' salvage value, n life of plant, and r rate of interest plus 1; then x, the equal annual allowance necessary to afford a return of the given per cent and reduce the investment to zero at end of n years, is:

$$x=\frac{(Vr^n-V')(r-1)}{r^n-1}$$

Assume a unit costing \$100, life 25 years, also that investment at beginning of each year should have a return of 5% thereon.

$$x=\frac{(100\times 1.05^{25})(1.05-1)}{1.05^{25}-1}=\$7.095245+$$

The details for the full 25 years period are tabulated in Table 4. This data is plotted in Form 7.

EQUAL ANNUAL PAYMENT METHOD.—This method, suggested by the Special Committee on Valuation of the American Society of Civil Engineers, was devised to secure an **equalized depreciation charge** and thus a **uniform investment cost.** By investment cost is meant that part of the cost of output which arises from investment in plant. It depends on amount of capital invested and rapidity of its exhaustion. If at end of each year a portion of investment is returned, as it should be under a proper system of charging for depreciation of capital outlay, interest charge on remaining investment decreases each year in proportion to amount of investment so amortized.

Assume a property costing \$100, life 25 years. Money invested in it is borrowed at 5%. What is to be determined is the equal annual investment cost, and therefore depreciation charges to cover such cost, so that out of such charges investment can be amortized and interest at 5% paid on the reducing investment. The sum which must be placed in a sinking fund each year so that the annual payments plus accumulations at 5% compound interest will amount to \$100 in 25 years is, according to the sinking fund formula, \$2.0952+. By the equal annual payment method, instead of establishing a sinking fund, each annual depreciation charge is made equal to what the annual payment to a sinking fund plus the interest accumulations for that year would have amounted to had such a fund been established. In the third column of Table 5, depreciation for each year is assumed to be equal to annual increase of a sinking fund into which annual payments of \$2.0952+ are made and allowed to accumulate at 5%, thus amounting to \$100 at end of 25 years. These amounts, when deducted from amount invested as at beginning of each year, give remaining investment upon which interest for next year is computed. Return on remaining investment as at beginning of each year is shown in fourth column at 5%, and in fifth column at 7%. Sixth and seventh columns show depreciation and interest on remaining investment combined.

The data given in Table 5 are plotted in Form 8.

		$100.0000	$77.3800	$108.3300	$177.3800	$208.3300

PRODUCTION METHOD.—Varying productivity in recent years has given rise to a demand for a method of charging depreciation to operations which will increase it with increased production, and decrease it with decreased production. The Treasury recognizes the propriety of a depreciation charge made to fluctuate in harmony with fluctuations in production. Certain difficulties stand in the way of practical application of the plan. The **rate** cannot be determined on a **strictly mathematical basis.** An additional element of uncertainty is introduced; yet it reduces somewhat the burden during periods of business depression. Also, some forms of depreciation accrue at a rate which is little affected by production. It is probably correct to say that depreciation costs decrease and increase as production decreases and increases, but not in the same ratio. In other words, percentage of fluctuation of true depreciation cost from normal is not as great as are fluctuations of production from normal or average production. Hence, **periods of subnormal production** should be burdened with a depreciation charge smaller in total but larger

per unit of output than that charged in periods of normal production; while reverse is true for **periods of excessive production.**

The production method is better adapted to certain classes of assets than to others. Automobile trucks, delivery wagons, etc., can be depreciated on a per mile-run basis. One company calculates depreciation on Ford automobiles used by salemen at 2 cents per mile. It has found that for 30 cars depreciation has averaged 1.9 cents per mile per car.

Certain assets do not depreciate in harmony with amount of output. Thus it appears that good-will depreciates more rapidly in periods of depression, and vice versa. Certain kinds of furnaces depreciate less rapidly if kept heated constantly than if allowed to cool each day.

Depreciation and the Income Tax

INCOME DEFINED.—Weston defines income as "increase in wealth in addition to that which is already possessed." This is the **net profits concept** of income. In *People* v. *Niagara County Surveyors*,[8] the court said that, although "profit" and "income" are sometimes employed synonymously, strictly speaking income is "that which comes in or is received from any business or investment of capital without reference to the outgoing expenditures," but that profit is "gain which is made upon any business or investment when both receipts and payments are taken into account."

CAPITAL INCREMENT AS INCOME.—The question as to whether capital increment is income came before the U. S. Supreme Court in *Gray* v. *Darlington*,[9] which case arose under the income tax law of 1867, which levied a tax on "gains, profits, and income" of persons as well as of businesses, trades, and professions. The Supreme Court said: "Mere advance in value in no sense constitutes the gains, profits, or income specified by the statute. It constitutes and can be treated merely as increase of capital." **Specific question at issue** was whether advance in value of bonds, during 4 years, over cost was, when realized by sale, income as intended in the law and therefore subject to taxation as profits of the year in which sold. The court said: "The answer which should be given to this question does not, in our judgment, admit of any doubt. The advance in the value of property during a series of years can, in no just sense, be considered the gains, profits, or income of any one particular year of the series, although the entire amount of the advance be at one time turned into money by a sale of the property. The statute looks, with some exceptions, for subjects of taxation only to annual gains, profits and income."

The **Sixteenth Amendment** gave Congress power to "lay and collect taxes on 'incomes.'" It is probable that the word "income" was meant to bear the interpretation given it in *Gray* v. *Darlington*. This interpretation has the support of many cases dealing with interests of life-tenant and remainderman, in which it has become customary to regard increments derived from sale of capital assets held in trust not as income but as principal, which passes to the remainderman. In *Brewster* v. *Walsh*, the District Court of the U. S., District of Connecticut, held the same view, saying that "there is no income from the sale of investments." On Mar. 28, 1921, the U. S. Supreme Court reversed its decision in *Gray* v. *Darlington*, asserting that any increase in value of capital assets, when realized, is income, and as such taxable under

[8] 4 Hill (N. Y.) 20.]
[9] 15 Wall. 63.

the income tax law. The test case involved the estate of Arthur Ryerson, who left, as a part of his estate, capital stock in firm of J. T. Ryerson & Son, valued at $560,000 as of Mar. 1, 1913. In 1917 this stock was sold for $1,280,000, cash received becoming a part of the estate. A tax of $311,000 was collected on this increase and suit was brought for recovery. The Supreme Court declared this to be income, and relied for authority chiefly on its recent decisions: in *Stratton's Independence* v. *Howbert*, in which income was defined as "gain derived from capital, from labor, or from both combined"; in *Eisner* v. *Macomber*, in which income was defined as "gain derived from capital, from labor, or from both combined" provided it be understood to include profit gained through sale or conversion of capital assets; and in *Hays* v. *Gauley Mountain Coal Co.*, in which the court drew an important distinction between the wording of the act of 1867 and that of 1909.

INCOME CONCEPT IN LEGISLATION.—By act of Aug. 5, 1861, Congress provided for a 3% tax on excess over $800 of the "annual income of every person residing in the United States or elsewhere or from any source whatever." This law was never put into effect. **In 1862** a tax of 3% was levied on "annual gains, profit or incomes of any person residing in the United States, whether derived from any kind of property, rents, interest, dividends, salaries or from any profession, trade, employment or vocation carried on in the United States or elsewhere, or from any source whatever," to the extent that the income exceeded $600. If the income exceeded $10,000, the rate was 5%.

The **income tax law of 1894,** intended to become effective Jan. 1, 1895, was levied on "gains, profits and income derived from any kind of property, rents, interest, dividends, or salaries, or from any profession, trade, employment or vocation." According to the section of the law explaining income, necessary expenses actually incurred in carrying on an occupation were deductible, also interest on indebtedness, losses actually sustained, and worthless debts. The law provided that profits derived from sale of real estate were to be considered income only in case real estate had been purchased within 2 years previously. The **law of 1862** taxed such profits irrespective of time of purchase. The **law of 1864** made them income only when the real estate had been bought in same year as sold, but this was placed at 2 years in 1867. This was a crude attempt to distinguish between capital profits and trading profits.

The **income tax law of 1913** provides that net income shall include "gains, profits, and incomes derived from salaries, wages, or compensation for personal services of whatever kind, and in whatever form paid; or from professions, vocations, businesses, trade, commerce, or sales or dealings in property, whether real or personal, growing out of the ownership or use of or interest in real or personal property; also from interest, rents, dividends, securities, or the transaction of any lawful business carried on for gain or profit, or gains or profits and income derived from any source whatever, including the income from, but not the value of property acquired by gift, bequest, devise, or descent."

This law adopts the concept of income as being a **regular periodic return** because it specifically excludes windfall accretions to surplus. It was the intention of Congress that the unearned increment should not be regarded as income but as accretion to capital. The law provided for deducting "necessary business expenses, interest on personal indebtedness, losses actually sustained during the year, including worthless debts charged off, and a reasonable allowance for exhaustion, wear and tear of the property arising

out of its use in the business (not exceeding in the case of mines 5 per cent of the gross value of the year's output at the mines)."

The **law of 1916,** in defining net income, employed nearly the same words as are found in the 1913 law quoted above, merely changing the phrase "any lawful business" to "any business," but whereas the 1913 law exempted acquisitions of property acquired by gift, bequest, devise, or descent, this exemption is not mentioned in the 1916 law, while specific provision is made in latter for inclusion of income from stock dividends.

The **law of 1918** defined net income by first listing the items composing gross income and listing those composing the allowable deductions, gross income less deductions being net income. Gross income was made sufficiently comprehensive to include all possible sources of revenue, while specific items were excluded as not constituting income and consequently were non-taxable. Among these were proceeds of life insurance companies, the value of property acquired by gift or devise, and income from certain tax-exempt securities. In case of non-resident aliens, gross income was made to include only gross income derived from sources within the United States.[10] The definitions of gross income in case of individuals and in case of corporations did not differ in essentials, the definition of gross income for individuals being made to apply to corporations with certain specified exceptions applicable to life insurance companies and mutual marine insurance companies but which are of no interest in so far as general principles are concerned.

To arrive at net income, the following **deductions** from the amount of gross income as limited by the law, were allowed:

1. All ordinary and necessary expenses **paid or incurred** during the taxable year in carrying on any trade or business, including a reasonable allowance for salaries and rentals.
2. Interest **paid or accrued** within the taxable year on indebtedness incurred in the purchase of certain securities the interest upon which is exempt from taxation under the law.
3. Taxes **paid or accrued** within the taxable year.
4. Losses **sustained** during the taxable year and not compensated for by insurance or otherwise, if incurred in trade or business, or if **incurred** in any transaction entered into for profit, although not connected with his trade or business.
5. Losses **sustained** during the taxable year on property not connected with the trade or business if arising from fires, storms, shipwreck, or other casualty, or from theft, when not compensated by insurance or otherwise.
6. Debts **ascertained to be worthless and charged off** within the taxable year.
7. A reasonable allowance for the exhaustion, wear and tear of property used in the trade or business, including a reasonable allowance for obsolescence.
8. A reasonable deduction for the **amortization** of the cost of buildings and other facilities constructed, erected, installed, or acquired, on or after Apr. 6, 1917, for the production of articles contributing to the war, and for the **amortization** of the cost of vessels constructed or acquired on or after Apr. 6, 1917, for the transportation of articles or men contributing to the prosecution of the war.
9. In case of mines, oil and gas wells, other natural deposits, and

[10] Section 213 for individuals; Section 233 for corporations.

timber, a **reasonable allowance for depletion and for depreciation of improvements.**

10. Contributions or gifts made for charitable, religious, scientific, and educational purposes, not in excess of 15% of the taxpayer's net income when computed without the benefit of this deduction.

11. Provision was made for filing claims in abatement based on substantial losses, incident to the year 1918, "resulting from any **material reduction** (not due to temporary fluctuations) **of the value of the inventory** for such taxable year, or from the actual payment after the close of such taxable year of rebates in pursuance of contracts entered into during such year upon sales made during such year." The law further provided that in case no such claim was filed but it could be shown that during the taxable year 1919 a substantial loss of this character had been sustained the amount of such loss could be deducted from the net income for the taxable year 1918, thus necessitating a redetermination of the taxes for that year.

The **law of 1921** continues the policy previously developed. It also provides that a reasonable addition to a reserve for bad debts shall be a deductible item.

In England income was and is used, with reference to income taxation, in the sense of "annual income."

DEPRECIATION POLICY OF TREASURY.—As interpreted by the Treasury Department for income tax purposes, **depreciation** excludes the idea of reduction in market value due to changing commercial conditions. Moreover, the amount allowable on the grounds of exhaustion, wear and tear, or obsolescence should be determined in accordance with some consistent plan whereby amounts thus allowed as deductions over useful life of property plus any salvage value remaining will be equivalent to its cost, or to its value as at Mar. 1, 1913, if purchased before that date.

The Treasury adheres to the theory that the depreciation allowance should be just sufficient to afford replacement at original cost of investment and not at some greater or lesser cost which may have been necessitated by changing prices. This is termed the "investment theory" of depreciation as distinguished from the "utility theory," which is based on the assumption that the replacement to be provided by depreciation reserves is one which is not of equal cost, necessarily, but one which is of equal utility. During periods such as that from 1910–1920, variations in prices would create discrepancies in amounts which would be reserved, respectively, according to the two methods. The **majority of practitioners** adhere to the theory followed by the Treasury.

The **Treasury's theory of depreciation** is grounded on the fact that most kinds of property approach a point where their usefulness is exhausted. It is to property of this sort that the allowance is limited. The theory of depreciation does not apply to inventories and to stocks held for trading purposes, nor to land when considered apart from improvements or developments added to it. Neither does it apply to the exhaustion of mineral deposits for which other provision is made. For the Treasury's purposes the deduction is restricted to property used in the business of the taxpayer and does not apply to expenses in the form of depreciation of his dwelling or of automobiles used chiefly for pleasure.

DETERMINING ALLOWANCE FOR DEPRECIATION.—Art. 165 of Reg. 62 provides: "The capital sum to be replaced should be charged off

over the useful life of the property either in equal annual installments or in accordance with any other recognized trade practice, such as an apportionment of the capital sum over units of production. Whatever plan or method of apportionment is adopted must be reasonable and must have due regard to operating conditions during the taxable period."

This gives the taxpayer latitude in determining the exact method to follow in ascertaining his allowance. The expression "any other recognized trade practice" gives almost unlimited scope to the taxpayer, the only limitation being that his plan must have met with recognition in the trade. In England the **reducing balance method** is popular. The Inland Revenue, in prescribing rates, usually expresses them as percentages such as should be used according to that plan. In the United States the **straight-line method,** which requires that an equal percentage be written off original cost each year, is most popular. No plan has received the official sanction of the Treasury Department, probably because it has not attempted to prescribe any rates.

VALUE TO BE DEPRECIATED.—The value to be depreciated is either: (1) the value of the asset as at Feb. 28, 1913, or (2) its cost if acquired subsequent to that date. The former is an arbitrary valuation adopted because it was unconstitutional for Congress to tax income until after the adoption of the Sixteenth Amendment to the Constitution. As a general rule the value as of Mar. 1, 1913, was the original cost less depreciation as of that date. If there had occurred appreciation previously to Mar. 1, this may be taken into consideration in determining value as of Mar. 1, 1913, for depreciation purposes. Conversely, if value was actually less than cost less depreciation, that value should be used as the base. Ordinarily no revaluation on the basis of such appreciation or depreciation in excess of that written off is made; but sometimes, especially in case of patents, the fair market value as of Mar. 1, 1913, is shown to be much in excess of cost.

Cost is the amount paid for property plus additional expenditures for betterments and improvements. The amount subject to depreciation may be reduced by losses, damages, or sales. The greatest difficulty in determining cost for purposes of depreciation arises when a single purchase is made of a plant which consists of both depreciating and non-depreciating assets, as when land and buildings are purchased. In such instances some plan must be devised of determining the values assignable to the depreciating and non-depreciating assets, respectively.

When **consideration given in payment** is in some other form than cash, as for instance when stock or bonds are the consideration, cost is the fair value of such securities. This is determined by the market value of the securities, if they have a market value; otherwise the fair cash value of the property as at time of sale must be determined. When property is acquired by gift or devise, bequest, or descent, value as at time of such transfer is basis for determining depreciation. The estimated salvage or scrap value must be taken into consideration in determining the annual allowance.

ERRORS IN ESTIMATING DEPRECIATION.—If an error is made in estimating proper rate to be used owing to impossibility of forecasting with accuracy the useful life of an asset, when the property is abandoned or scrapped the sum written off plus salvage value may not equal original cost. **If too little has been written off,** the difference should be taken as a loss in the year in which the property is scrapped and should be deducted in that year for income tax purposes. **If too much has been written off,** the excess should be reported as income in the year in which the residual value of the property

is realized. This is equivalent to the realization of a larger salvage value than was anticipated. If the error has been so large as to indicate negligence or fraud, the Commissioner of Internal Revenue may require that the returns for past years be amended and the allowances for depreciation corrected.

This is of importance over a period of years in which tax rates vary extensively, whereas if tax rates remain stationary over long periods it is a matter of relatively small importance. At any time when a taxpayer becomes convinced that his estimates are in error he can alter them, subject to approval of the Commissioner of Internal Revenue.

WHEN DEPRECIATION COMMENCES.—Sometimes **construction** extends over a considerable period of time before operations begin. It is satisfactory to the Treasury if depreciation is first deducted in the year in which the property is put into operation and for the period of time extending from the date of the inception of the property's use to the close of the period for which the return is made. Any depreciation which occurs before property is put into actual use should remain capitalized and thus become a charge to be distributed over the property's useful life.

ADJUSTMENT OF DEPRECIATION RATES.—Since it is impossible to estimate with accuracy the future life of a property, even under favorable circumstances, and since many unforeseen emergencies arise to modify existing estimates, revision of these should be permitted when conditions warrant. Not only is taxpayer allowed to take depreciation due to wear and tear into consideration in making his estimate of his property's future useful life, but also is permitted "to allow for such future (not past) obsolescence as may be expected from experience to result from the normal progress of the art." **Changes in market value** should in no way modify the plan followed since these are not related to useful life of property. Changes which affect market values should be considered only in so far as they actually affect property's estimated useful life.

VARYING RATES FOR SAME PROPERTY.—Among the factors which may make it necessary to use different rates for two items of the same physical construction are: climate, repairs, hours of operation, speed, and so on. It is poor policy to accept **published rates** blindly and without making due allowance for special circumstances which may invalidate rates which are quite proper when applied under different and perhaps more normal circumstances.

RATES TO BE USED.—Contrary to practice of English Inland Revenue, the Treasury Department has found it inadvisable to prescribe any definite rates for specific classes of assets. It lies within the power of the Commissioner to reject any rate he may think excessive. **Care and hours of operation** are but two of many other factors entering into the question of rates. **Repairs** is a factor. **Intent to defraud** will not be presumed unless taxpayer takes a stand which is very clearly unreasonable.

PATENTS AND COPYRIGHTS.—Amount to be allowed as a deduction for patents and copyrights is **cost** or **fair market value** as at Mar. 1, 1913, if acquired before that date. The Treasury has held that **cost of a copyright** to the author consists of his actual cash outlay in securing it, including actual cost of producing the work, but does not include any amount for his time and labor. This amount should be apportioned over life of patent or copyright, from time of grant, or of acquisition, or since Mar. 1, 1913, according to circumstances. In case of a patent or copyright acquired from the government, cost consists of fees, cost of drawings, models and so on, which were

actually paid. **If a patent is purchased with stock,** fair market value of stock paid determines value. **If a patent becomes obsolete** before it expires, the deduction which may be made, with the Commissioner's permission, is such part of amount subject to a depreciation deduction as is proportional to remaining years of patent's life as compared with period which may intervene between date of acquisition of patent and date of its legal expiration.

Patents are similar to good-will, in that their value is directly measured by earning power. Although patents have a definite legal life, their value is frequently more or less permanently capitalized, because wherever possible their value is made permanent through continuous improvements, also because, even when legal title has passed, use and control of the article may be so completely monopolized and exploited that competitors cannot successfully take it up. In such case its value becomes a part of a concern's good-will. Deductions based on a normal life of 17 years are optional with the taxpayer. Where value of a patent tends to become a more or less permanent part of capital through the process described above, the taxpayer is favored. The assignment of patents under an agreement giving assignor 40% interest in profits therefrom, entitles assignor to deduct 40% of depreciation deductible.

DRAWINGS AND MODELS.—The tax-payer is given option of charging off cost of drawings, patterns, models, etc., designed to improve facilities or output, against current revenues, or of treating them as assets. In latter event if their useful lives can be estimated with a reasonable degree of accuracy, they may be written down by the usual method of caring for depreciation.

DISCONTINUED PROPERTY.—Use of property may be discontinued for sundry reasons. If this is done but no sale or other disposition of property is made, taxpayer should make a determination of loss or gain resulting from such abandonment. The loss or gain must be disclosed in taxpayer's return for year in which such loss or gain is ascertained, and a full disclosure of facts relative thereto made. If such discontinued property is sold or otherwise disposed of, amount realized thereon should be compared with estimated salvage value employed in determining loss or gain as explained above. Difference is to be considered as loss or gain of year in which sale or disposition of property is made.

To illustrate, assume that Company A permanently discontinues use of a building which cost $25,000 and against which there exists an offsetting depreciation reserve of $15,000. It is estimated that salvage value of building is $5,000, although it is not sold or otherwise disposed of. Under these circumstances Company A should return a loss of $5,000 along with all available data substantiating that figure. Such loss should be deducted in the return for the year in which its determination is made. If, during next fiscal year, the building is disposed of for $6,000, this amount, compared with estimated salvage value, $5,000, indicates a gain of $1,000, which should be returned as taxable income in the year in which such sale is made.

DEPRECIATION OF FARM PROPERTY.—Farmers are permitted an allowance on all buildings except the dwelling house which they occupy. Farm machinery and other physical property, such as livestock purchased for draft, dairy, or breeding purposes, is subject to a suitable depreciation allowance. No allowance is permissible on livestock raised or purchased for resale. Cost and estimated life are principal factors to be taken into consideration in determining livestock depreciation.

Farmers may determine their net income by the **inventory method.** This requires that an inventory be taken at the close of each year, and that gross income be determined by adding to sales the gain or deducting therefrom the loss for the year due to increase or decrease in value of inventory. This method may be illustrated as follows:

Sales of livestock and farm products for year		$9,000
Inventory of livestock and products, beginning of year	$3,000	
Cost of livestock bought during year	2,000	
	$5,000	
Deduct inventory of livestock and products, end of year	4,000	
Deduct decrease in inventory value at end of year as compared with inventory at beginning of year		1,000
Gross income for year		$8,000

If inventory method is not used, gains, profits, and income derived from sale of products should be included in income whether such products are produced on the farm or are purchased. Sometimes farmers find it desirable to sell property originally purchased for use instead of for resale, such, for example, as farm machinery and draft horses. In such cases amount to be reported as income is excess of sale price over cost reduced by any sums previously deducted for depreciation. If sale price is less than cost less depreciation previously deducted, difference is to be reported as a loss.

One who operates a farm for profit is entitled to deduct all amounts "actually expended" as necessary expenses in carrying on such business. He may consider **cost of ordinary tools** of short life or of small cost as expenses to be deducted directly, but **cost of machinery and farm buildings** should be considered as a capital investment and charged off over period of their useful lives by means of formal allowances for depreciation. Amounts expended in developing farms, orchards, and ranches up to time when they become productive should be capitalized. Usually such capitalized sums will admit of depreciation allowances from time when their productivity commences, because orchards deteriorate as do likewise physical improvements of most kinds. **Purchase of work animals and livestock,** whether for resale or otherwise, is to be regarded as an investment, not as an expense, which will be either amortized by adequate depreciation allowances or removed through resale. **Automobiles** purchased exclusively for farm business are an investment subject to adequate depreciation allowances. **Repairs and upkeep** on them are deductible as expenses, but when they are so deducted the depreciation allowance should not be larger than is sufficient to cover wear and tear not made good through such repairs and upkeep. If an automobile is used partly for farm business and partly for pleasure, only such depreciation cost and cost of repairs and upkeep are deductible as are attributable to farm business. The remainder is a personal expense and as such is not an allowable deduction.

When farmers hold products for more favorable markets, no deduction is permissible on account of **shrinkage in weight or value** or because of **physical deterioration.** Neither is **total loss of a prospective crop** or of **one not yet sold,** a deductible loss. If a farmer is engaged in raising and selling livestock, he is not permitted to make any deduction for value of those which perish. If, however, livestock has been purchased for any purpose and afterwards dies or is killed by order of the authorities of a state or the United States.

actual purchase price reduced by any depreciation previously allowed thereon, and also any insurance received, is a deductible expense. Same general rule applies to other property destroyed by order of state or United States authorities. **When inventory method is followed** in determining gross income, no deductions can be made for livestock or products lost, since such losses are reflected in inventory at the year's end.

REMOVAL OF BUILDINGS AND EQUIPMENT.—When old buildings are removed or destroyed and when old machinery is scrapped to make replacement possible, such sum may be deducted as a loss as is represented by difference between cost of scrapped property and "the amount of depreciation sustained with respect to the property prior to its demolition or scrapping, and allowable as a deduction in computing net income." If a taxpayer purchases real estate and demolishes a building standing thereon to make place for a new building, he is not permitted to make any deduction on account of razed building or for cost incurred in demolishing it. The presumption is that the land, exclusive of value of old building, is equal to purchase price of property plus cost of removal of old building.

SECURITIES AND STOCKS.—Fluctuations in market value of stocks and bonds give no occasion for deductions from gross income on account of shrinkage in value of such securities. Such loss can be claimed only in case it results from actual disposition of properties while in possession of lessee. Therefore no allowance for depreciation can be granted. Allowance may be had for repairs and upkeep cost incurred by lessee, however.

ACCOUNTING PROCEDURE.—Under the **corporation excise tax law of 1909,** the Commissioner required that depreciation, to be an allowable deduction, must be credited directly to property account affected. This was contrary to best accounting practice. On May 9, 1912, use of reserve accounts for reception of such credits was recognized as correct procedure. Since then it has had the approval of the Internal Revenue Bureau, although if taxpayer prefers, he may still follow procedure of crediting allowance directly to property account.

The requirement that depreciation allowances be computed with "express reference to specific items, units or groups of property" is one which, if adhered to, would do much towards placing procedure with reference to depreciation on a scientific basis. It is required that each item or unit be considered separately or else "specifically included in a group with others to which the same factors apply." The expression, "the same factors," refers to the conditions which determine rate and nature of depreciation. Many concerns still follow **antiquated procedure** of writing off a round sum on entire cost of depreciating assets. Frequently its amount depends on current earnings, being increased in prosperous years and decreased in lean years.

MANAGEMENT OF RESERVES.—The Bureau of Internal Revenue, in its earlier rulings, held that the reserves could not be used for any other purpose than making good loss sustained through depreciation, and that "the investment of depreciation reserve funds in the concern's own plant in the way of additions and extensions would appear to be such a diversion." This was based on theory that such investing of depreciation funds would indicate that excessive amounts were being set aside to cover depreciation and that a corporation doing this would be adding to value of its capital assets.

In a letter to Willard H. Lawton, replying to his letter taking issue with this stand, Bureau of Internal Revenue said that although investment of depreciation funds in additions and betterments appeared to be a diversion

of such funds to purposes other than making good depreciation already sustained, it may be allowed "if the property account is charged with the amount of the fund thus used, in which case the depreciation account remains a liability and renewals and replacements when made are charged against it rather than against current income."

On Apr. 10, 1917, the Bureau ruled that the reserves need not be held intact or remain idle until needed to replace specific assets for which reservations were made, or until needed to restore capital invested in depleted assets. Providing reserves are not excessive and are properly entered on books so as to constitute a liability against their respective complementary assets, conversion of such reserves into tangible assets would not be regarded as constituting a diversion of funds such as would make the deduction for depreciation an improper one.

DIVERSION OF RESERVES.—Depreciation reserves are set up to avoid overstatements of profits. They do not form a part of surplus, except in so far as they are excessive. For this reason **dividend payments** are not properly chargeable against them, and should not in any case be so charged as long as there exists any distributable surplus. In 1917 the Bureau held that a dividend so charged would be regarded not as a distribution of profits but as a distribution of capital, and therefore not subject to tax in the hands of the taxpayer. Dividends ought not to be charged against depreciation reserves in any case, because if there is a surplus it should be charged, while if there is no surplus such a dividend payment is equivalent to a reduction of capital and should be regarded as such rather than as a distribution of reserves. In Oct. 1917 the Bureau revoked the ruling made in the preceding July, in the following manner: "All such dividends received by stockholders declared out of such reserves accumulated subsequent to Mar. 1, 1913, constitute income to the stockholder under the act of Sept. 8, 1916, and must be accounted for in returns of net income."

Present attitude of the Treasury regarding **distribution of reserves** may be summarized briefly. Depreciation reserves are not surplus, and therefore ordinary dividends cannot be paid from them. If dividends are so paid they are to be regarded as liquidating dividends and are taxable as income to recipient only to extent that amount so paid is in excess of cost or fair market value of his shares of stock as of Mar. 1, 1913. Before such a distribution from a depletion or depreciation reserve will be deemed to have been made, surplus and undivided profits must first have been exhausted. When dividends are paid out of such reserves, stockholders must be notified that such dividends are a return of capital and not a distribution of profits.

A **somewhat different problem** arises when a corporation proceeds to distribute its so-called net income among its stockholders without having first made provision for depreciation. Under earlier regulations such corporation was estopped from any deduction on account of such depreciation, unless conclusively shown that property account had been reduced by amount claimed for depreciation, or unless it had been credited to a depreciation reserve account and was shown to be of reasonable amount.

This has been modified to the extent that a corporation which has thus paid dividends without first having set up depreciation reserves may reopen its books in order to make proper reservations. It must then file an amended return for period in question. This privilege is not granted if preparation of the original return was fraudulent or grossly negligent. When proper adjustment is made and reserve set up, corporation is in position of having paid dividends out of its depreciation reserves to extent that it has exceeded

its actual net income. The stockholders have received dividends consisting partly of a distribution of capital. So they should make **amended returns** showing amount received from profits and from capital, i.e., from the depreciation reserve, so that tax can be adjusted.

SUDDEN OBSOLESCENCE, ETC.—Various emergencies may cause sudden termination of usefulness of capital assets. **Machinery** may become obsolete as result of new inventions. An increase in cost of or change in **method of manufacture** may make it necessary to abandon it altogether, in which case machinery specially constructed to facilitate its processes may be abandoned. **Legislation** sometimes directly or indirectly makes impossible continued profitable use of property. Such cases of loss are not supposed to be cared for by ordinary process of allowing for depreciation. Under these circumstances taxpayer may claim as a loss in year in which he discontinues use of such assets "the difference between the cost, or, if acquired prior to Mar. 1, 1913, fair market price or value as of that date of any assets so discarded (less any depreciation sustained and allowable as a deduction in computing net income) and its salvage value remaining."

TREASURY POLICY ON OBSOLESCENCE.—Until passage of 1918 revenue law, no deduction for obsolescence was specifically recognized by law. The **law of 1918** provided for a "reasonable allowance for obsolescence" in addition to that for exhaustion, wear and tear. By **provisions of earlier laws** it was necessary to dispose of property before loss due to obsolescence could be deducted for purpose of arriving at taxable income. **Treasury regulations** issued in interpretation of 1921 law provide that "inasmuch as under the provisions of the income tax acts in effect prior to the Revenue Act of 1918 deductions for obsolescence of property were not allowed except as a loss for the year in which the property was sold or permanently abandoned a taxpayer may for 1918 and subsequent years revise the estimate of the useful life of any property so as to allow for such future (not past) obsolescence as may be expected from experience to result from the normal progress of the art." The regulations further provide that the proper allowance to be made for exhaustion, wear and tear, and obsolescence is such as will (by a consistent plan, but not necessarily at a uniform rate), during useful life of property, with salvage value, and having due regard for expenditures for current upkeep, replace original cost of property, or its value as of Mar. 1, 1913, if taxpayer acquired it before that date. The regulations still further provide that:

> When, through some change in business conditions, the usefulness in the business of some or all of the capital assets is suddenly terminated, so that the taxpayer discontinues the business or discards such assets permanently from use in such business, he may claim as a loss for the year in which he takes such action the difference between the cost, or if acquired prior to March 1, 1913, the fair market price or value as of that date of any asset so discarded (less any depreciation sustained and allowable as a deduction in computing net income) and its salvage value remaining. This exception to the rule requiring a sale or other disposition of property in order to establish a loss requires proof of **some unforeseen cause by reason of which the property has been prematurely discarded,** as, for example, where an increase in the cost of or other change in the manufacture of any product makes it necessary to abandon such manufacture, to which special machinery is exclusively devoted, or where new legislation directly or indirectly makes the continued profitable use of the property impossible.

This regulation is issued as an interpretation of that section of the law which provides for the deduction of "losses sustained during the taxable year and not compensated for by insurance or otherwise, if incurred in trade or business."

No mention is made in the law of **inadequacy** and it is not emphasized in the regulations and rulings.

TREASURY POLICY ON DEPLETION.—The **corporation excise law of 1909** required that corporations, in determining net income, should make a deduction for "all losses actually sustained within the year."

Few corporations claimed a deduction for depletion of natural resources under this provision.

The **law of 1913** was the first to contain definite provision for an allowance for depletion of natural deposits, viz.: "In case of mines a reasonable allowance for depletion of ores and all other natural deposits, not to exceed 5% of the gross value at the mine of the output for the year for which the computation is made." The law said nothing regarding the proper basis for determining the value to be written off for depletion purposes.

The **law of 1916** provided that depletion allowances should not exceed "market value in the mine of the product thereof which has been mined and sold during the year for which the return and computation are made," but total allowable was not to exceed original investment or, if purchase of deposit is made before Mar. 1, 1913, fair market value as of that date.

The **law of 1918** provided for a "reasonable allowance for depletion . . . according to the peculiar conditions in each case, based upon cost including cost of development not otherwise deducted." **For properties acquired before Mar. 1, 1913,** fair market value as of that date is basis for depletion. Further provision was made for discovery of natural resources on or after Mar. 1, 1913, where fair market value was "materially disproportionate to the cost." In this case the depletion allowance was based on fair market value as at date of discovery or within 30 days after discovery.

THEORY OF DEPLETION.— Until the advent of income taxation the most authoritative interpretations of the theory of depletion were to the effect that the depletion allowance should be based strictly on **original cost,** and that the only effect of new discoveries is to lessen the amount of depletion allowable per unit of output. This plan has been described by A. Lowes Dickinson, as follows:[11]

> . . . As a general principle, whatever there was in the ground, whether known or unknown, has been reduced during the period under consideration by whatever amount has been extracted; and while the new discoveries may be accepted as reducing the necessary rate of provision for extinction from, say, one dollar to one cent per unit of quantity, the original principle that provision must be made holds good on the smaller figure, whatever it is. It may be, of course, that the provisions made in earlier years have been sufficient to cover a number of future years on this basis, from the commencement, of the rate subsequently found to be sufficient in view of the new discoveries; and in this case there would be no necessity to provide further for extinction until the total production at the new rate is equal to the total amount written off.

Accountants long regarded this position as correct. Its **practical application** necessitated frequent revision of the depletion allowance per unit of output where, as in case of copper mines, new discoveries are continually being made. **Under this plan** the charge per unit of output continues at all times to be a fraction of the original cost of properties, but the denominator which determines the amount of that fraction—the changing amount of known existing tonnage—changes with each new discovery; consequently the depletion per unit of output also changes.

The application of the income tax led to reconsideration and revision of

[11] Accounting, Practice and Procedure, pp. 172–173.

these views. The status of its theory and application have been stated as follows:[12]

Theory:

1. That gradual exhaustion of the ore body is an element of expense which should be taken up in each and every fiscal period during which minerals continue to be won from the mine, at a more or less constant rate per ton.

2. That the total expense of this character to be absorbed in the operating accounts is the intrinsic value of the mine content (in place *en bloc*) which existed from the beginning, although much of it may have been latent and determined only by "extension in depth."

3. That by the term "intrinsic value of the mine content" as used above is meant the product of two factors:

(a) The tonnage of mine content as finally ascertained.

(b) A unit price per ton representing the bedrock value of the average grade of ore, in place *en bloc* including proved ore, probable ore, and prospective ore, estimated at the commencement of business. In bedrock value the price of metals in estimated mine content is calculated at some figure between "basic" and "normal"; cost of production and selling is calculated at maximum probability; the rate of mining and the life of the property must be estimated; from these factors a discounted or present value at true rate of interest is obtained; and this capital value is then reduced by a substantial value due to the element of risk.

Application of Theory:

1. The depletion expense of each and every fiscal period during which mining operations occur is the tonnage of ores extracted multiplied by the more or less constant rate per ton established by original estimate of value in place.

2. The rate per ton of ore extracted, for purposes of the depletion expense computation, would change only in the event of subsequent discovery of relatively large bodies of ore of a grade differing widely from the original estimates.

3. In the case of "extension in depth" developing new values it may be necessary from time to time to adjust the book value of the mining property, in order to harmonize with intrinsic value.

PROBLEM OF VALUATION.—In all cases, except where cost serves as basis for determination of depletion charges, the Treasury requires that **basis** shall be **fair market valuation** as of a "basic date," i.e.: Mar. 1, 1913, in case of property acquired before that date; date of acquisition in case of property acquired on or after Mar. 1, 1913; or date of discovery; or within 30 days thereafter in case of property discovered after Mar. 1, 1913. The "fair market value" of a property is that amount which "would induce a willing seller to sell and a willing buyer to purchase." There are many ways of determining such an amount. It is necessary to employ a method of valuation which is comprehensive enough to be scientific.

The **Treasury regulations** provide that where fair market value as of a given date is to serve as depreciation base, such valuation must be determined "in the light of conditions and circumstances known at that date, regardless of later discoveries or developments." A prominent engineer says, however, that an engineer could not be expected to "stultify" himself by ignoring such later developments as would aid in determining value as of a past date.

Following the **practice of competent mining engineers** the Treasury has adopted the **present value method** of valuation; but the Commissioner considers any and all factors and evidence which throw light on what market value is. Among these are: cost, actual sales and transfers of similar properties, market value of stocks or shares, royalties and rentals, value fixed by owner for purposes of capital stock tax, valuation for local or state taxation, partnership accountings, records of litigation in which the property was in question, amount at which property may have been inventoried in probate

[12] William B. Gower, in the *Journal of Accountancy*, Aug. 1918, pp. 85–86.

court, and disinterested appraisals by approved methods. Many of the ordinary evidences of value are not good criteria in case of mines and oil and gas wells, because of dissimilarities existing even between properties which lie in juxtaposition.

Present Value Method.—See section on "Valuation."[13]

Depreciation Rates for Specific Assets

INTRODUCTORY.—Depreciation rates are empirical in character and local conditions are important factors. Nevertheless, much progress towards **standardization of rates** has been made by associations of manufacturers and others. The income tax has made desirable a comparison of rates used. The rates given in the following pages represent the best practice, but they should always be accepted with reservations necessary to allow for local conditions.

Whether or not **obsolescence** is covered in the rate is a consideration of importance. If the **sinking fund method** is followed and income from the fund is added to the principal, the rate is correspondingly reduced. Policy regarding **charging betterments and extensions** to revenue is a factor. **Handling of repairs** is a consideration of equal importance. The following rates should be accepted only with such considerations as the above in mind.

AUTOMOBILES.—R. H. Whitten, in "Valuation of Public Service Corporations,"[14] gives life of automobiles as 10 years, but this is excessive under most conditions. Montgomery suggests 20% per annum in "Income Tax Procedure, 1918."[15] In England 20% per annum, reducing balance method, is allowed on motor omnibuses for income tax purposes. The Treasury suggests a depreciation rate of from 20% to 25%, based on a life of 4 to 5 years, according to use.

The Uniform Accounts for Systems of Water Supply, Bureau of the Census, places the useful life of automobiles at 10 years.

The Rulings Board of the Finance Department of the Bureau of Aircraft production in Mar. 1918, during war times, ruled that 20% per annum be allowed on automobiles in computing contractors' reimbursements for normal depreciation.

BANKS.—Banks usually make liberal allowances for depreciation, some making it a policy to write off entire cost of premises over a comparatively short period of years. On Dec. 14, 1918, the Federal Reserve Board sent the following instructions to all federal reserve banks:

In order that there may be uniformity of practice, the Federal Reserve Board has approved for Federal Reserve Banks the adoption of the following rules for the treatment of depreciation and extraordinary charges against earnings and profit and loss account at the closing of books Dec. 31, 1918:

1. **Cost of Federal Reserve and Federal Reserve bank notes.**—Balance of account, as shown by books on Dec. 31, to be charged to current expense account.
2. **Furniture and equipment account.**—Balance of account, as shown by books on Dec. 31, to be charged to current expense account.
3. **Cost of vaults.**—(a) All expenditures made during the year 1918 for vaults and vault equipment to be charged to current expense account; (b) balance of account, as shown by books on Dec. 31, 1917, to be charged to profit and loss account.

---

[13] See p. 463.
[14] Vol. I, p. 352.
[15] P. 373.

4. **Alterations and improvements.**—Charge against current expense account all expenditures made during the year 1918 in repairing, altering, or remodeling bank premises.

5. **Bank premises.**—(a) Where properties have been purchased with the intention of erecting new bank buildings, banks to be permitted to charge against profit and loss account an amount sufficient to cover the estimated value of buildings which will have to be razed, such estimated valuation of buildings to be submitted to the Federal Reserve Board for approval before depreciation allowance is determined.

(b) Where properties have been remodeled and are now used as permanent banking quarters by a Federal Reserve Bank, a reasonable depreciation charge will be permitted, but in no case shall it exceed 10% of the estimated value of buildings on Dec. 31, 1918.

(c) Where a Federal Reserve Bank has purchased, or may purchase, a site for a new building, it will be permitted to charge down the book value of premises now owned and occupied to a fair selling price, such price to be submitted to the Federal Reserve Board for approval before depreciation allowance is determined.

The current books of banks do not correctly state taxable income. The Bureau of Internal Revenue says this is true because "furniture, fixtures, and improvements have been charged to expense account, and further for the reason that national bank examiners and State bank examiners have arbitrarily written down on the books of the banks, banking house furniture and fixtures." Since banks are not permitted to reopen their books and charge depreciation or adjust asset accounts (banking house, furniture and fixtures, etc.), the Bureau of Internal Revenue permits banks to keep separate books for income tax purposes which will enable them to file correct returns, these to be made up from the current books and necessary adjustments to be made thereon for depreciation.[16]

BOILERS.—R. H. Whitten, in "Valuation of Public Service Corporations,"[17] gives life of boilers as 20 years. Dicksee allows from 12½% to 20% on reducing balance.[18] In *Spring Valley Water Works* v. *San Francisco*,[19] the district judge found annual depreciation of boilers to be 5%. Uniform Accounts for Systems of Water Supply, Bureau of the Census, gives life of boilers as 20 years.

BOIS D'ARC.—Life given as 100 years by Interstate Commerce Commission, in Valuation Docket No. 2.[20]

BRIDGES.—Interstate Commerce Commission in its valuation of Texas Midland Railway found service condition for deck and superstructure separately. It allowed 70 years as life of metal parts.[21]

BOTTLE MANUFACTURERS.—The following rates have been adopted by the National Bottle Manufacturers Association:

	Annual Rate of Depreciation
BUILDINGS:	%
Concrete or all steel	3
Mill construction	3–4
Ordinary brick	4–5
Frame	7½–10

---

[16] Committee on Appeals and Review, Memorandum 337, 5-21-1415.
[17] Vol. I, p. 352.
[18] H. R. Hatfield, Modern Accounting, p. 142.

	Annual Rate of Depreciation
Machinery and Operating Equipment:	%
Steam and power plant	–10
Producer plant	–12
Mixers	–10
Tank (entire tank)	–10
Blowing machines	–15
Lehrs	–10
Conveyors	–10
Moulds	–25
Other machinery and equipment	–10

BUILDINGS.—The following rates, adopted by the Manufacturers' Cost Conference, are quoted from Ficker's "Industrial Cost Finding":[22]

	Annual Rate of Depreciation
	%
Reinforced concrete or steel and tile	2
Brick and steel with non-combustible roof and concrete floors	2.5
Brick, steel and wood	3
Brick and wood	3
Steel frame, wooden roof, and corrugated iron walls	3.5
Steel frame, non-combustible roof, and corrugated iron walls	3
Concrete block, with wooden roofs, floors	3.5
All-wood structures, cheap (20 years)	5
All-wood structures, well built (20 years)	4.5
Sprinkler system (20 years)	4

The following is taken from McKay's "Valuing Industrial Properties":[23]

	Life in Years	Authority
Buildings (brick)	66⅔	Henry Floy
Buildings (brick)	50	E. G. Connette
Fuel and water stations	25–50	H. P. Gillette
Grain elevators	33⅓	"
Miscellaneous buildings	33⅓	"
Masonry buildings	40–50	"
Railroad buildings:		
Brick (salvage value 8%)	33	Wm. Arthur
Concrete and stone (salvage value 8%)	50	"
Steel frame, brick and stone (salvage value 8%)	50	"
Shops—combination steel, iron, and wood	25	"
Road department buildings	33	H. P. Gillette
Roundhouse and shops	33	"
Transportation department buildings	33	"
Wooden frame railroad station buildings	33	"
Buildings, fireproof	50	C. W. McKay
Buildings, slow-burning	30	"
Buildings, non-fireproof	15	"

[22] P. 337. [23] P. 145.

The following is taken from Kimball's "Cost Finding":

	Life in Years
Brick or steel frame buildings, easy service	40
Brick or steel frame buildings, severe service	20
Good wooden buildings, easy service	30
Good wooden buildings, severe service	15

The following is from Nicholson and Rohrbach's "Cost Accounting,"[24] and is said to have been adopted at various conferences of a large manufacturing enterprise:

	Annual Rate of Depreciation %
BUILDINGS:	
Housing:	
Dwellings—frame	3
Tenement houses	5
Hotels	5
Fireproof:	
Concrete	2
Brick	2½
Brick and concrete floors	2½
Main buildings—brick and concrete	2–2½
Steel frame—non-combustible roof, and corrugated iron walls	3
Steel with corrugated sheet iron or steel plate	5
Corrugated iron—steel frame concrete floor	3
Reinforced concrete, or steel and tile	2
Stone, brick, concrete with or without steel, first-class stone and brick	2
Mill or slow-burning buildings—brick, steel, and wood, or brick and wood	3
Non-fireproof:	
Outbuildings	7½
Wood	5
Substantial wooden buildings	5
All-wood structures—well built	5
All-wood structures—cheap material	7½
Steel frame—wooden roof, and corrugated iron walls	5
Steel or corrugated sheet iron with wood	5
Corrugated iron—wood frame and floor	5
Corrugated iron—wood frame, concrete floor	5
Corrugated iron—steel frame, wood floor	5
Concrete block with wooden roofs and floors	5
Miscellaneous structures:	
Hose reel and guard houses	15
Pine swamp (magazines)	2
Frames, stables, and sheds	5
Bins—concrete and brick	5
Bins—wood alone	20
Trestles—steel (not including rails or ties)	3⅓
Trestles—wood (not including rails or ties)	6⅔
Docks, piers, and wharves	3⅓

[24] P. 146.

Dry docks—basin	2
Dry docks—floating	5

The following quotation is from a federal bulletin on depreciation restricted in application to Form 1040 A:

Under question 99 of the Income Tax Primer of 1918 an estimate is made of the probable useful lifetime of certain kinds of buildings. It is estimated that the average life of a frame building "without repair or replacement" is 25 years; of a brick building, 35 years; of a stone or steel and concrete building, 50 to 100 years. It is also estimated that the lifetime of ordinary machinery is 10 years, that of automobiles used for business or farm purposes and farm tractors, 4 to 5 years.

Therefore, wherever the cost of repairs is not known or is so thoroughly inter-mixed with replacements as to be inseparable the flat rate of 4% for frame and 3% for brick buildings will, under ordinary conditions, cover both repairs and depreciation. In other words.

[25] P. 339.

the estimate of 25 years for a frame and 35 years for the life of a brick is based on the assumption that they are not being kept in repair.

But property kept in repair will, of course, be subject to a longer life because the weaker parts of the building are continually being bolstered up and made to last as long as the strongest parts. And as a matter of correct accounting, where the cost of repairs is known, it is preferable to charge both the repairs and a reasonable and steady allowance for depreciation. This is permitted by article 162 of the regulations previously quoted that "Property kept in repair may, nevertheless, be the subject of a depreciation allowance." The accounting truth is recognized that no repairs can wholly offset depreciation. Repairs do in fact offset the depreciation of a part (that particular part to which they have been applied) but they cannot offset or arrest the depreciation of the whole. . . . .

It will be found, that if kept in repair, under ordinary conditions the rate of depreciation on a frame building should be 2½% (based on a life of 40 years) and the rate of depreciation on a brick building should be 2% (based on a life of 50 years). Where, however, repairs are not claimed a rate of 4% (or 25 years) for frame and 3% (or 35 years) for brick should be allowed.

Of course, it will be remembered that the basis here set is for standard cases occurring under standard conditions. As the law and regulations intend that each individual case shall be decided on its own individual merits it is plain that any case that is affected by any unusual condition must be given an individual consideration and an individual solution. For examples, buildings, in a flood district, which were subject to being flooded once or twice a year must be allowed an added rate of depreciation equal to the amount of this unusual wear and tear. Buildings (and, of course, machinery or other property) which are subject to unusual wear and tear by the nature of the business in which they are employed should have this fact reflected in the rate of depreciation allotted to them. . . . .

Reverting to the subject of depreciation through wear and tear, it should be remembered by the deputy that because the rates of 2½% on a frame building and 2% on a brick are herein mentioned as covering ordinary conditions, that it is not possible under the same conditions for the actual percentage rate to be higher. Many deputies make no adjustment for the fact that a building may have been purchased by the taxpayer after it was already quite old. But it is evident that if a brick building, which was constructed for $5,000 and was expected to last 50 years, is purchased by the taxpayer after it is 30 years old, he cannot expect the building to last more than another 20 years. The price which he pays for the building which is 30 years old will not be nearly as great as the original cost. Therefore, to give him a rate of 2% on this later value merely because the construction is brick would not conform to the regulations which require that the remaining life shall be taken into consideration. If he purchased the house for $2,000 it is evident that on this new cost price he should be allowed 5%, which rec gnizes that the low value of $2,000 reflected the fact that the building would only last 20 years. It can readily be seen that for this building to allow 5% on $2,000 results in no greater charge than to allow 2% on its original cost of $5,000.

CEMENT INDUSTRY.—The following mortality table, which shows average estimated life of various properties used in the cement industry, has been adopted:

	Life in Years
MACHINERY:	
Quarry:	
Locomotives	13
Tracks and cars	9
Steam shovels	11
Dredges	11
Drills—well	9
Drills—tripod	7
Livestock	8
Carts and wagons	7
Cable-way	9

	Life in Years
Raw Department:	
Crushing machinery	14
Dryers—upright	11
Dryers—rotary	11
Slurry tanks	16
Grinding machinery	13
Clinker Burning Department:	
Kilns	13
Coolers—upright	12
Coolers—rotary	13

Brick	50
Frame	30
Frame and stucco	33

ELECTRICAL MANUFACTURING INDUSTRY.—The following extract is from the standard accounting and cost system of the electrical manufacturing industry:

Determination and Application of Rates for Depreciating Manufacturing Plant Account

I. GENERAL

1. All rates are to be applied to first cost.
2. The rates recommended are those which are to be applied to first costs, to obtain amount to be included in costs and estimated costs,

and are in addition to maintenance expenditures and renewals as provided for in indirect manufacturing expense accounts.

3. All rates recommended are based on normal costs and operating conditions. In case of a factory working overtime and with night shifts for any appreciable length of time, or under other extraordinary conditions, or in cases of facilities acquired at excessive costs, higher rates should be assessed so as to absorb in the costs, during the period of extraordinary activity:
   1. The abnormal physical exhaustion.
   2. The abnormal primary cost of buildings and structures.
   3. The cost of equipment estimated to be surplus in normal times.

	Rate Recommended %
A. LAND	
Land—purchase price	0
Land—grading and improvements	0
B. BUILDINGS	
a. Buildings (total reserve 75%):	
Wooden buildings and sheds	10
Corrugated iron buildings	10
Brick and wood (mill construction)	5
Brick and steel (fireproof construction)	3
Reinforced concrete (fireproof construction)	3

NOTE.—In those cases where plant accounts include accessories, care should be taken to segregate such accessories, in order that the proper rates of depreciation may be applied.

	Rate Recommended %
b. Structures (total reserve 90%):	
Structures	12½
Water, drainage and sewer pipes (outside)	6
Piping and electrical conductors (outside)	6
c. Sprinkler system (total reserve 90%)	5
d. Heating and ventilating and other inside piping and wiring (total reserve 90%):	
Heating and ventilating	5
Other inside piping and wiring	5
C. MACHINERY AND TOOLS	
a. Machinery (total reserve 90%):	
Special machinery	7½–90
Rates on special machinery depend upon the estimated present use and their adaptability for other use.	
Standard machinery	7½–10
Electrical apparatus	7½–10
Ovens and furnaces	10
Power plant equipment	7½
b. Machinery—foundations and installation (total reserve 100%):	
Foundations for machinery and apparatus	12½
Installation of machinery	12½

Years to be Applied

c. Semi-durable tools and instruments (total reserve 100%):

Semi-durable tools, 25% on each year's expenditures.... 4

Set up on the books an estimated value equivalent to the additions to the account during the last 4 years.

Electrical equipment, 16⅔% on each year's expenditures.... 6

Molds, jigs, punches, dies, and special tools, 33⅓% on each year's expenditures.... 3

Metal flasks:

Inasmuch as all foundries have their proper equipment of metal flasks, the cost of making all metal flasks is to be charged to indirect expense account No. 460. When flasks are scrapped, the scrap value will be credited to indirect expense account No. 460. The difference between the inventory at scrap value at the beginning and the end of the year will be taken in the expense account. There will, therefore, be no depreciation on this item.

D. Patterns and Drawings (total reserve 100%)

a. Patterns, 33⅓% on each year's expenditures.... 3

b. Drawings:

Set up on books estimated or appraisal value. Expenditures chargeable to development or shop supplies account No. 240.

E. Furniture, Fixtures, and Appliances (total reserve 100%)

a. Furniture and fixtures in shops
b. Furniture and appliances in factory offices
c. Fire protective apparatus

(a–c): 20% on each year's expenditures.... 5

From a valuation viewpoint, it is recommended that 100% reserve be set aside.

Set up on the books a value obtained by inventory where practicable. Where this method is impracticable, a value should be set up on basis of previous year's additions, the number of such years being dependent upon the varying circumstances.

F. Other Equipment (total reserve 90%)

Railway tracks and overhead equipment; renewals and repairs charged to operating expense.... None

Rolling stock.... 3–6

Automobiles and other conveyances.... 25

II. Property Other Than Manufacturing Plants

The rates recommended are those that would be applied for similar items for manufacturing plant items. In case items are dissimilar, rates should be applied consistent with those used for manufacturing plant items.

ELECTRIC PLANTS.—The following is from Nicholson and Rohrbach's "Cost Accounting":[26]

[26] P. 147.

	Annual Rate of Depreciation
Electric Plant Equipment:	%
Dynamos	5
Electric machinery—generators	5

Note: D. denotes depreciation. O. denotes obsolescence.

The Arizona Commission allowed $3\frac{1}{2}\%$ on depreciable property of electrical companies in 1913. The California Commission allowed 3% on the value of property in 1913.[27] The Nevada Commission allowed 5% in a mining camp in 1913.[28] In 1912 the Wisconsin Commission allowed $4\frac{1}{2}\%$ on reproduction cost new.[29] In New York a committee formed to report on statistics and accounts of public utility companies advocated a minimum rate of depreciation of $3\frac{1}{2}\%$ on the entire fixed capital of electric companies. The English Inland Revenue allows 3% on the reducing balance on cables, and 5% on the reducing balance on plant and machinery.

The New York Committee on Statistics and Accounts of Public Utility Companies suggested a tentative rate of $3\frac{1}{2}\%$ on the entire fixed capital of electric companies.

Note: D. denotes depreciation. O. denotes obsolescence.

The New York Public Service Commission for the First District, in 1912, in a case involving an accounting order issued subsequently to the approval of an issue of securities after reorganization, ordered the Third Avenue Railway Co. of New York to reserve at least 20% of its operating revenues for depreciation. A similar requirement was prescribed for the Metropolitan Street Railway Co. Its successor, the New York Railways Co., contested the order. The Commission's order was upheld by the Appellate Division of the Supreme Court, First Department, but on May 4, 1918, the Court of Appeals reversed the lower court on the ground that the order was beyond the power of the Commission. No question was raised as to the reasonableness of the 20% allowance, however.

In the *Chicago Street Railway Assessment Case* (1902), it was ordered that 6% should be deducted as depreciation on cars, tracks, and machinery in order to arrive at net income.

In the *Savannah Street Railway Fare Case* (1912), the Georgia Railroad Commission gave 3% of the total valuation of the physical properties of an electrically operated city and suburban street railway system as a fair and reasonable allowance to cover depreciation and obsolescence.

In the *Columbus, Ohio, Electricity Rate Case* (1906), the special master reports 5% of total cost of plant including real estate, where the real estate is nominal in amount, as a fair depreciation rate.

ELECTROTYPES.—These should be charged monthly as the direct cost of a first printing, and the amount remaining charged to the account should be carefully revised at the close of each fiscal year. A successful book will bear writing off of the entire cost of such plates against the first edition, while if the book is unsuccessful there can be no excuse for retaining such items as assets.

ENGINEERING COSTS.—Engineering Board Memorandum No. 226,[30] incorporated in Interstate Commerce Commission Valuation Docket No. 2 (Texas Midland), reads in part:

"A small portion of the expenditure for engineering is connected with property which depreciates. In view of the fact that the larger portion is expended on location surveys, grading, and other property which does not depreciate, and that the accounting records have been so kept in the past as to make it impracticable to segregate that portion of the expenditure which depreciates, the service-condition per cent of the account shall be considered at 100."

ENGINES.—Dicksee allows from 10% to 12½% for depreciation on engines on the reducing balance.[31] At a conference consisting of representatives of the United States Bureau of the Census, the American Water Works Association, the New England Water Works Association, the American Association of Public Accountants, and others, a uniform system of accounts for water supply systems was adopted in 1911 which assumed the life of engines, pumping machinery, and wood pipes to be 25 years. In a California case, *Spring Valley Water Works* v. *San Francisco*,[32] the district judge found the annual depreciation of pump engines, flumes, and wooden structures to be 2.5% per annum.[33]

ENVELOPE MANUFACTURERS.—The following rates of depreciation have been adopted by the Bureau of Envelope Manufacturers of America:

	Annual Rate of Depreciation %
Steam and power plant	10
Printing presses	10
Platen cutting and creasing presses	10
Die-cutting presses	7½
Straight-knife cutters	7½
Slitters	7½
Solid cutting dies	33⅓
Plunger folding machines	10
Open-end folding machines	10
Panel patching machines	10
Machine gummers	10
Clasp and tension machines	15
Gum-cooking equipment	10
Box department machines	10
Machine tools	10
Electric motors	10
Automobile trucks	25

30 As revised Nov. 6, 1915.

31 H. R. Hatfield, Modern Accounting, p. 142.

32 192 Fed. 137, decided Oct. 21, 1911.

33 R. H. Whitten, Vol. I, p. 430.

	Annual Rate of Depreciation %
Factory furniture and fixtures	10
Office furniture and fixtures	10

Type and electros—will be charged to expense at purchase cost, instead of being capitalized and then depreciated.

FURNITURE AND FIXTURES.—The following is from Nicholson and Rohrbach's "Cost Accounting" (page 151):

	Annual Rate of Depreciation %
Office and Shop Furniture and Fixtures (including store and tool room fixtures):	
Factory equipment	10
Furniture and fixtures	10
Partitions	7½
Watchman's system	7½
Benches, partitions—permanent	7½
Benches	8
Trucks and movable racks	7½
Miscellaneous equipment—including desks, chairs, typewriters, adding and calculating machines, blue-printing machines, filing cabinets and trucks, shelving partitions, time clocks, time detector systems, telephone, electrotypes, graphotypes, etc.	10
Typewriters and adding machines	20
Telephone equipment	7½

The Uniform Accounts for Systems of Water Supply, Bureau of the Census, gives 15 years as the life of office furniture.

R. H. Montgomery suggests a rate of 15% per annum as a fair average allowance.[34]

In Jan., 1918, the Rulings Board of the Finance Department of the Bureau of Aircraft Production ruled to allow a rate of 10% per annum for depreciation on furniture and fixtures in determining reimbursements to contractors under cost-plus contracts.[35]

GAS PLANTS.—The following is from Nicholson and Rohrbach's "Cost Accounting":

	Annual Rate of Depreciation %
Engines—gas and oil	7½
Fuel oil system	7½
Oil lines	5
Steel gas-producers, piping, etc.—including gas washers, gas scrubbers, gasometers, dust catchers, and dust collectors	6⅔
Brick gas-producers	6⅔
Gas supply system	6⅔
Gas plant equipment	6⅔

[34] Income Tax Procedure, 1917, p. 213.
[35] General Ruling No. 4.

The following is taken from Barker's "Public Utility Rates":

Gas Works	Life in Years	Authority	Cause
Ammonia concentrators	15	Wisconsin R. R. Com.	D.
Ammonia storage tanks	15	" " "	D.
Blowers	15	" " "	D.
Coal-gas benches	25	" " "	D.
Exhausters	25	" " "	D.
Gas holders	50	" " "	O. & D.
Governors	50	" " "	D. & O.
Mains:			
Small cast-iron (4 in. and under)	50	" " "	O.
Large cast-iron (6 in. and over)	75	" " "	O.

Tar and ammonia wells	50	" " "	O.
Extractor	40	" " "	O.
Water-gas machines	30	" " "	D.

Note: D. denotes depreciation. O. denotes obsolescence.

In the *Cedar Rapids Gas Case* (1909), 1.7%, sinking fund method was allowed.[36]

In the *Peoples Gas Light & Coke Co. Case* (1911), 2%, sinking fund method was allowed, the composite life of the plant being 35 years and the earning capacity of the fund 4%.[37]

In a New Jersey case, 6 cents per 1,000 cubic feet of output was allowed for depreciation. The sinking fund method was critized as being "not ordinarily applicable in connection with a property where renewals are being made of the minor portions of the plant."[38] This does not appear to be a vital consideration, however. The fund need not be kept intact. It is realized that a formal fund is not ordinarily practicable, however.

In the *Buffalo Gas Co. Case* (1913), the average life of the gas plant was determined to be 35 years.[39]

In Wisconsin (1912), 2% on reproduction cost new was allowed for depreciation.[40]

The New York Committee on Statistics and Accounts of Public Utility Companies suggested a tentative depreciation rate on the entire fixed capital of gas companies of 3%.

The English Inland Revenue allows 3%, reducing balance method, on gas holders, and 10% on meters, cookers, and gas fires (private).

GAS WELLS.—Consult the Treasury income tax regulations, also the "Manual for the Oil and Gas Industry," issued by the Treasury Department.

GLASSWARE.—The following rates of depreciation have been adopted by the Illuminating Glassware Guild:

---

[36] R. H. Whitten, Vol. I, p. 428.
[37] *Ibid.*, p. 429.
[38] *Ibid.*, Vol. II, p. 1197.
[39] *Ibid.*, p. 1198.
[40] *Ibid.*, p. 1203.

	Annual Rate of Depreciation %
Office equipment	10
Buildings:	
Structural steel	5
Concrete	3
Mill construction	3
Ordinary brick	4
Frame	7
Steam-power plant	10
Batch mixers	10
Machinery and equipment	10
Automatic and semi-automatic machinery	12½
Tanks	5
Furnaces	5
Gas producers	10
Automobiles	20

GOOD-WILL.—Formerly, under the income tax rulings no allowance was permitted for depreciation of good-will. This was altered by Treasury Decision 2929, issued Oct. 7, 1919, which was in confirmation of two letters to Levi Cooke, Washington, D. C., one signed by Commissioner Roper and dated June 21, 1919, the other signed by Acting Commissioner J. H. Callan and dated Aug. 19, 1919. Both letters related to obsolescence of good-will, trade-marks, and trade-brands, the value of which had been impaired or destroyed by prohibition legislation. The following is quoted from the letter dated Aug. 19, 1919:

In reply you are advised (1) that distillers and dealers in liquors are entitled to make a deduction (based upon actual cost or fair market value as of March 1, 1913) from gross income, on account of depreciation or obsolescence of their intangibles, such as goodwill, trade-marks, trade brands, etc., such deduction being limited to assignable assets, the value of which has been destroyed by prohibition legislation, and (2) that in arriving at the taxable income for the first taxable year ending on or after January 31, 1918, the obsolescence fully accrued on that date is to be allowed as a deduction in computing the income subject to taxation under the Revenue Act of 1918, plus a further deduction of such proportion of the remaining value of the intangible assets as the interval between January 31, 1918, and the end of the taxable year bears to the total interval between January 31, 1918, and January 16, 1920 (unless at an earlier date the taxpayer discontinues his business, in which case such earlier date shall mark the close of the period), and (3) that for any taxable year following the taxable year just referred to a deduction in respect of the value of such intangible assets on January 31, 1918, based upon a ratable distribution will be permissible.

It is the opinion of the department that the ratification of the 18th amendment in the month of January, 1918, by the states of Massachusetts, Maryland, and Kentucky, was the first definite indication that the prohibition amendment would be ratified by the requisite number of State Legislatures, and therefore that on January 31, 1918, a computable portion of the costs of goodwill, trade-marks, trade brands, or the value thereof, on March 1, 1913, if acquired prior thereto (excluding any intangibles acquired since that date, the expenditures of which were deductible and had been deducted in computing income for tax purposes) had become obsolescent. On January 31, 1918, the intangible assets had an actual value, viz.: the then present value of the income to be derived therefrom between that date and January 16, 1920, or at an earlier date should the taxpayer discontinue his business prior thereto. This value as stated above should be distributed ratably over the period from January 31, 1918, to January 16, 1920 (unless at an earlier date the taxpayer discontinues his business, in which case such earlier date shall mark the close of the period). The excess of the cost of the intangibles or the value thereof, on March 1, 1913, if acquired prior thereto (subject to the exclusions mentioned above), over the

value thereof, as of January 31, 1918, determined as outlined above, will represent the amount of obsolescence that was fully accrued on January 31, 1918.

The existence of good-will by actual purchase should always be a prerequisite to any consideration of its obsolescence or depreciation, whether for income tax purpose or otherwise. Under the Revenue Act of 1917, the Committee on Appeals and Review recommended that "values claimed for 'contracts, brands, and good-will' cannot be allowed as invested capital when it is not conclusivly shown that such values represent paid-in capital," also that "in reorganization no greater value can be given to corporate assets than existed before reorganization, the interest in the corporation being substantially the same as that in the partnership."[41]

In general, accountants have advocated writing down good-will, presumably on theory that purchase price of good-will is based on profits of a number of years less a fair return on invested capital.. Day suggests that interest on capitalization at 7% per annum should be deducted from total profits of past 5 years to secure value of the good-will, and he further states that this amount should be written off over the succeeding 5 years, 1/5 being charged against each year. Dicksee, on the other hand, says that good-will does not depreciate, but that it is liable to continual fluctuations in value. The balance sheet figure represents a value somewhere between the extremes.

Since good-will depends on earning power, its retention in the books after it has been established through a bona fide purchase must depend on earnings. When it appears that earning power has been definitely and permanently curtailed, the Good-Will account should be adjusted to correspond with the new conditions. Evidently no rate can be prescribed where fluctuations in value depend on many factors which only the future can determine.

GRADING.—Grading of railroads may appreciate.[42] In its valuation of the Texas Midland, the Interstate Commerce Commission made no allowance for either appreciation or depreciation.[43]

H. P. Gillette, in "Handbook of Cost Data for Contractors and Engineers" (pp. 1317–78), gives 10% as the annual depreciation.

The Controller of Philadelphia, in his "Manual of Accounting, Reporting and Business Procedure," gives 1% as the rate of depreciation of filling and terracing.

HARDWARE MANUFACTURERS.—The following rates of depreciation have been adopted by a large association of manufacturers. They apply to the manufacture of general hardware, and were furnished by an official of a large hardware manufacturing company.

Depreciation of buildings and equipment should be estimated at the beginning of each year and one-twelfth of the annual amount should be charged monthly as part of the departmental shop expenses. The following annual depreciation ratios, computed on net or reduced values, are recommended:

	Annual Rate of Depreciation %
Buildings—brick or concrete......	3
Buildings—wood................	5
Office furniture and fixtures.......	7
Yard railway....................	5
Elevators......................	5

[41] Committee on Appeals and Review, Memorandum 393.
[42] Interstate Commerce Commission, Valuation Docket No. 2. p. 130 (Texas Midland).
[43] *Ibid.*, p. 184.

	Annual Rate of Depreciation %
Fire apparatus	3
Piping and plumbing fixtures	3
Electric light equipment	3
Power plant	5
Line shafting	5
Furnaces, ovens, stoves, etc	5
Shop furniture	10
Shop fixtures	10
Patterns	15
Foundry flasks	15
Machinery	5
Tools, dies, etc	15

These ratios should be used only where a liberal policy is pursued in the matter of upkeep; that is, where the entire plant is kept always in first class repair, the charges for so keeping it being made to expense accounts 16, 17 and 18, and charged to current expenses and not to betterments.

HORSES.—E. Matheson, an English authority, advocates a rate of from 20% to 30% on the reducing balance.

The Uniform Accounts for Systems of Water Supply, Bureau of the Census (p. 28), gives 10 years as the life of horses.

Horses used in heavy work should be depreciated at about 25% yearly.

F. W. Densham, in the *Accountant*, May 28, 1898 (p. 570), suggests either periodic revaluations or a rate of 15% to 25%, according to the severity of work.

A bulletin issued by the United States Department of Agriculture shows that the average depreciation on 27 farms in Illinois, Ohio, and New York is $4.50 per horse.

L. R. Dicksee suggests that the depreciation will vary between 15% and 25% on the starting balance of the account, but thinks that revaluations should be made until enough experience is secured to enable rates to be fixed intelligently.

The Rulings Board of the Finance Division of the Bureau of Aircraft Production in Aug., 1918, ruled to allow 20% annual depreciation on original cost of horses and mules in arriving at actual cost of manufacture in order to reimburse contractors under cost-plus contracts.

HOTELS.—R. P. Bolton in Building for Profit (p. 76), gives the life of hotels at from 15 to 18 years.

L. R. Dicksee, in "Hotel Accounts," gives rates of 5-7½-10% on furniture and fixtures.

R. H. Montgomery, in "Auditing Theory and Practice," suggests periodic revaluations of china, glass, cutlery, silver, etc.; also suggests as an alternative method regular credits to a reserve account and charges to profit and loss of amounts sufficient to cover the estimated actual renewals and depreciation over a period of years, all renewals to be charged to this reserve account.

J. L. Nicholson and J. F. D. Rohrbach, in "Cost Accounting" (p. 146), suggest 5% as the proper rate for hotels.

F. W. Pixley, in "Accountancy" (2nd ed., p. 219), suggests 2½% on furniture, 15% to 25% on carpets, 10% on electro plate, and 2% to 30% on china and glass.

H. S. Tiffany, in "Digest of Depreciations" (p. 7), gives rates of 2½% to 3½% on brick and stone buildings, and 3½% to 4½% on frame buildings. These are based on actual life and do not include repairs.

ICE INDUSTRY.—The Commissioner of Internal Revenue has approved the following percentages based on original cost to cover "wearout depreciation":

	Annual Rate of Depreciation %
For wooden natural-ice houses and wooden storehouses.....	$6\frac{4}{10}$
Ice houses, harvesting and hoisting machinery, including conveyors, hoists, merrimacs, basin saws, etc., and power plants for same, elevators..........................	$9\frac{1}{2}$
Machinery of steam-driven manufacturing plants*.........	$7\frac{1}{10}$
Machinery of electric-driven manufacturing plants.........	$7\frac{3}{10}$
Frame buildings..................................	5
Brick buildings..................................	$2\frac{1}{2}$
Concrete buildings..............................	2
Horses†...	$15\frac{4}{10}$
Harness...	$16\frac{2}{10}$
Wagons and other horse-drawn vehicles..................	$14\frac{3}{10}$
Automobiles....................................	$22\frac{5}{10}$
Motor trucks....................................	$22\frac{2}{10}$
Sundry delivery equipment..........................	15

In applying the above rates, the Commissioner recommends that the line of demarcation between maintenance and repairs be drawn:

Wear-out depreciation and maintenance are to be separated according to the definition of wearout depreciation, which is that loss of original usefulness which has gone so far as any "Unit of Utility" beyond the ability of repairs to correct, so as to make necessary the complete replacement of that "Unit." By maintenance (synonymous with repairs) is meant the correction of some local defect of a "Unit of Utility" by bringing the defective portion in the easiest way into practical parity with the general condition of the remainder of the "Unit." By the definition of a "Unit of Utility" is meant a single purposed mechanism or part of a construction, subject to such like conditions of use, that it would naturally be repaired or replaced as a unit.

INTANGIBLE PROPERTY.—See "Copyrights," "Good-Will."

LABEL MANUFACTURERS.—The following rates of depreciation have been adopted by the Label Manufacturers National Association, the Folding Box Manufacturers National Association, and the National Association of Employing Lithographers.

	Annual Rate of Depreciation (On Gross Investment Value) %
BUILDINGS:	
Concrete....................................	3–4
Mill construction..............................	4–5
Ordinary brick................................	5–7
Frame.......................................	6–10

* In case of bad water, this figure to be increased up to $7\frac{6}{10}$% as a maximum.

† In case of the Southern States, where a different grade of vehicle and horse is used. these figures become 20% for vehicles.

	Annual Rate of Depreciation (On Gross Investment Value) %
Machinery and Operating Equipment:	
Steam and power plant	5–10
Flat and rotary presses	7½–10
Offset presses	10 –12½
Cylinder cutters and creasers	7½–10
Platen cutters and creasers	7½–10
Cutters, straight and die	5
Automatic gluers	7½
Bronzers	12½–15
Bed, platen, and cylinder embossers	15
Ink grinders	5
Other ink manufacturing equipment	7½–12½
Electro foundry	7½–10
Electros (originals)—charged to jobs, less scrap value.	
Electros (working plates)—charged to jobs, less scrap value.	
Litho stones (originals)	2½ up
Litho stones (for presses)	10
Etc. for other machinery and equipment	Various

LABORATORY APPARATUS AND APPLIANCES.—The Uniform Accounts for Systems of Water Supply, Bureau of the Census, gives the life of this as 10 years.

LAND.—Land ordinarily does not depreciate; yet this is by no means to be regarded as a universal rule. Farm lands suffer actual physical deterioration when their fertility is not maintained by means of constant fertilizing by one means or another.

In case of land utilized for building sites, roadbed, and so on, the situation is somewhat different, since fertility is not a factor of importance. In such cases land tends to appreciate in value due to normal community growth, and the element of wear and tear is immaterial.

In a Massachusetts telephone appraisal for rate purposes, in 1909, land was excluded when calculation of depreciation was made.[44] This is the usual rule in valuation cases. In the *Texas Midland Valuation Case*, land which cost originally $67,493.44 was given a present value of $254,479.98.[45]

The Bureau of Internal Revenue, for income tax purposes, does not allow for depreciation of improved or unimproved land if it is caused by ordinary erosion, exhaustion, or any other cause.[46]

Frequently land and buildings are indistinguishably merged into a single account. In such cases the two items should be valued separately and thereafter kept in separate accounts. The cost of land includes: examination costs, title registration fees, conveyancer's and notary's fees, purchasing agent's commissions or salary, taxes accrued to date of title as well as any liens upon the title when these are assumed by the purchaser. Cost of assessments for public improvements which enhance the value of the land, cost of grading not properly chargeable to building, and expenses of condemnation proceedings, may be properly charged to cost of land.

---

[44] R. H. Whitten, Vol. I, p. 433.
[45] Interstate Commerce Commission, Valuation Docket No. 2, p. 77.
[46] Income Tax Primer for Farmers, 1921, p. 25.

LEASEHOLDS.—Leaseholds which terminate at a fixed future date, as well as other assets having a definitely fixed time of expiration, must be systematically amortized or written down if capital is to be preserved. These may not depreciate in the strictly material sense of the word, yet the deterioration which takes place is analogous to that which occurs in case of depreciation of other forms of wasting assets. In case of leaseholds, as in case of patents, the period over which the cost must be written off is definitely prescribed.

Leaseholds may be paid for in annual sums, or there may be an initial bonus in addition to the annual sums. Such a bonus should be considered a deferred charge to be distributed over the period covered by the lease.

Leases ordinarily run for any period up to 99 years, but they are sometimes for longer periods. In New York City they are frequently for 63 or 84 years.

When only a periodic rental is paid for the lease, no value appears in the books; but when a bonus is paid, there appears its unamortized value, which should be written off over the remaining period of the lease by means of periodic credits to the leasehold and corresponding charges to Rent account.

LUMBER.—H. S. Tiffany, in his "Digest of Depreciations" (p. 16), gives the following rates for different kinds of lumber:

	Annual Rate of Depreciation %
Ash	10
Hickory	15
Sycamore	25
Beech	12
Poplar	8
Oak (burr and white)	6
Oak (red and black)	12
Cottonwood	12
Walnut	8
Hard maple	6
Soft maple	8
Linn	12
Pine (white or yellow)	5

The following is from Ficker's "Industrial Cost Finding":

	Annual Rate of Depreciation %
MACHINERY AND LARGE EQUIPMENT:	
Boilers, pumps, feedwater, heaters and air compressors	6
Power piping	6
Switchboards, main wiring and conduit	6
Engines and dynamos	5
Machinery, motors, machine tools, traveling cranes, etc	4–5
Punch presses, bending rolls, power shears and drop hammers	4–5
Machine tool accessories—boring bars, drivers, key seating broaches, etc. (all renewals to repairs)	50
Cupolas, converters, melting furnaces, and accessories	5
Annealing and heating furnaces, ovens, forges, etc.	5
Motor trucks	20
Storage battery locomotives (battery renewals to repairs)	10
Horses and wagons	12
SMALL TOOLS:	
For machines, net additions	50
Hand tools, net additions	50
Punches and dies (standard), net additions	50
Chills, iron and steel flasks and accessories, net additions	50

The following is from Nicholson and Rohrbach's "Cost Accounting":

	Annual Rate of Depreciation %
MACHINERY:	
Machine tools:	
Lathes, slotters, planers, drilling and boring machines; milling machines, tools and surface grinders; emery wheels, keyway cutters, tapping machines, arbor presses, centering machines, squaring machines, hack saws, notching machines, buffing machines, test pumps, pointing machines, metal band saws, belt lacers, saw grinders, etc.; die sinking-machines, car-wheel presses, saw-setting and filing machines, angle-benching machines, cold saw-cutting off machines, etc.	$6\frac{2}{3}$
Gun and tool machinery	6
Cartridge machinery	8
Tool and shop machinery	5
Punches, shears, hydraulic and pneumatic riveters; bending rolls, straightening rolls, straightening presses, bulldozers, joggling machines, flanging machines, frame-setting machines, beveling machines, keel-bending machines, can brakes, etc., forging and upsetting machines	$6\frac{2}{3}$
Punch presses, bending rolls, power shears and drop hammers	$6\frac{2}{3}$
Hydraulic forging presses, bending presses and fluid compressors	$6\frac{2}{3}$
Hammers—steam, drop, or helve	10
Shafting, pulleys, hangers, and belting	5
Belting	7

	Annual Rate of Depreciation %
Wood-working machinery—including band, jig and rip saws, dove-tailing machines, moulding machines, tenoners, mortisers, sizers, wood-boring machines, wood shapers, wood lathes, wood planers, universal wood workers, carvers and moulders, sanding machines, surfacers, swing saws, scroll saws, jointers and wood cut-off saws, embossing press, core box, disc grinders	5
Miscellaneous machinery:	
Locomotive cranes, steam and electric shovels	10
Coal and ash-handling machinery	8
Hydraulic jacks	10
Conveyors—coal, ash and sand, screw conveyors	6
Skip and stock hoists	6
Grinding and mixing machines; crushers, pulverizers, squeezers, scrap shears, concrete mixers, mud guns, jarring machines, tumbling barrels, water cinder mills, sand blast machinery, moulding machines, core-ramming machines, roller feeders, etc.; testing machines, vibrating machines, tie rod machines, welding machines, etc.; magnetic separators, venturimeters, oil meters, fans, gauges, blowers, shaving exhaust system, acetylene generators, oil-testing machines, sand dryers, oiling systems, sewing machines, locking machines, crimping machines, classifiers, thickeners, ball mills, roller feeders, revolving screens, flotation machines, belt-strapping machines, mechanical mixing machines, etc.	10
Pickling washing machines, electric and acetylene welding machines	10
SMALL TOOLS:	
All small tools of an asset nature	10

The following is from Kimbal's "Cost Finding":

	Life in Years
Steam engines	15–30
Steam boilers	15–30
Boiler room feed pumps	20
Engine-room instruments and gauges	10
Steam piping, valves, and fittings	10–15
Portable engines and boilers	10
Gas engines	10–15
Turbo generators	20–30
Electric generators	20–30
Electric motors	20
Storage batteries	10
Switchboards and instruments	15
Heavy machine tools	25
Light machine tools	15–20
Shafting, hangers, and pulleys	20–30
Belting	10–25

When the rate on loose plant and tools would exceed 20% per annum, it is better not to write off an annual percentage. One alternative is to make a rough valuation each year by count or otherwise; another is to charge all costs of maintenance and renewal to income. It may be found desirable to classify this type of assets into groups for accounting purposes.

In the *Chicago Union Traction Case* (1902), 6% was allowed, to determine net earning.[47]

In the Texas Midland valuation the service condition of small hand-tools and other similar property was generally assumed to be 50%. The service condition of machinery and equipment was determined by actual observation, taking into consideration its age and its expected service life.[48]

The English Inland Revenue allows 15%, reducing balance method, on machinery used in steel manufacture.

The General Electric Co. carries a reserve of $21,695,883.32 against a book figure for machinery of $49,262,663.81.[49]

The Rulings Board of the Finance Department of the Bureau of Aircraft Production, in Jan., 1918, ruled to allow 7½% per annum on machinery in determining contractors' reimbursements under cost-plus contracts.[50]

MALLEABLE IRON INDUSTRY.—The American Malleable Castings Association, out of the experience of its members, approves the following rates for the principal kinds of malleable iron foundry buildings and equipment.

	Annual Rate of Depreciation %
Buildings:	
Concrete	2½
Brick	3
Sheet-iron	10
Melting department equipment:	
Melting furnaces and apparatus	7½
Spruce mill and slag washer	15
Laboratory equipment	10
Crane	10
Molding department equipment:	
Hand squeezers	15
Air molding machines	20
Core department equipment:	
Core ovens and apparatus	7½
Core machines	15
Sand mixer	20
Benches, racks, trays, trucks	10
Hard-iron cleaning department equipment:	
Tumbling barrels, with motor, shafting and belting	15
Sand blast barrels and tables, motor shafting and belting	30
Dust arrester	10

[47] R. H. Whitten, Vol. I, p 424.
[48] Interstate Commerce Commission Valuation Docket No. 2, p. 86.
[49] Twenty-ninth Annual Report, p. 6.
[50] General Ruling No. 4.

	Annual Rate of Depreciation %
Finishing department equipment:	
Emery-wheel stands, drop hammers, lathes, drill presses, air choppers, milling machines, threshing machines, etc., with motor, shafting and belting	10
Assorting and shipping department equipment:	
Sorting tables, trucks, scales, etc.	10
Automobile trucks	20
Trimming and inspecting department equipment:	
Benches, scales, trucks	10
Emery-wheel stands, with motor, shafting and belting	10
Annealing department equipment:	
Annealing ovens and apparatus	10
Annealing trucks	20
Crane	10
Soft-iron cleaning department equipment:	
Tumbling barrels, with motor, shafting and belting	15
Sand blast barrels and tables, motor shafting and belting	30
Dust arrester	10
Power plant equipment:	
Steam boiler, generator, air compressor, steam piping, electric wiring, etc.	7½
Office furniture and fixtures	10

Experience has proved these rates to be conservative, and it is very doubtful if the member who is not providing for depreciation at substantially the rates noted above is fully maintaining his plant values.

The amount provided to represent the deterioration in plant and equipment values due to wear and tear and obsolescence should be charged monthly to cost of production and credited to Buildings and Equipment Depreciation Reserve accounts. Against the reserve accounts should be charged all expenditures of the nature of complete renewals and replacements which to that extent restore plant values and reduce the accrued depreciation.

Current repairs and partial renewals of an inextensive nature should be charged directly to cost of production.

MASONRY.—The Uniform Accounts for Systems of Water Supply, Bureau of the Census, gives 50 years as the life of masonry of filtration plants.

In the Texas Midland valuation 100 years was taken as the normal life of concrete and other masonry.[51]

MINE EQUIPMENT.—In a synopsis of a report made by the committee on cost of the Winding Gulf Association, published in *Coal Age*, Sept. 19, 1918 (pp. 545 7), the following rates of depreciation based on original cost were recommended:

	Annual Rate of Depreciation %
STRUCTURES:	
Wooden tipples, complete	8
Steel tipples, complete	5
Wooden power house (building)	7
Stone or brick power house	5
Machine shop—wood	8

[51] Interstate Commerce Commission Valuation Docket No. 2, p. 184.

	Annual Rate of Depreciation %
Machine shop—stone or brick	5
Supply house—wood	8
" " —stone or brick	5
Blacksmith shop—wood	8
" " —stone or brick	5
Stable building—wood	8
" " —stone or brick	5
Churches and schools	4
Squire's office and jail	4
Sand houses	4
Post-office building	4
Substation—wood	7
" —stone or brick	5
Humidifier building—wood	7
" " —stone or brick	5
Powder house—concrete, stone or brick	10
Wash house—wood	10
" " —stone or brick	5
Fireproof vaults	4
Freight stations	10
All other small buildings	10
MINE DEVELOPMENT:	
Clearing property	5
Creek changes	5
Wa on roads	5
Slopes and shafts	5
Diamond and drill holes	5
Train roads	20
Mine development	10
EQUIPMENT:	
Dynamos and engines	8
Boilers	11
Pumps, heaters, and other power house equipment	8
Header lines	8
Fans	5
Water tanks	7
Railway sidings and approaches	7
Humidifiers	12½
Telephone lines	10
Sawmills	10
Hoists	7
Incline drums and larries	10
Incline ropes	33⅓
Cage ropes	50
Hoist engines	7
Mine telephones	20
Mine pumps	20
Steel rail	10
Mine wagons (cars)—wood	20
" " " —steel	17

	Annual Rate of Depreciation %
Mine locomotives	10
Mining machinery	20
Electric drills	20
Stable equipment	25
Patent mine doors	20
Copper wire	7
Supply house fixtures	10
Post-office equipment and fixtures	7
Fire equipment	20
Air compressors	8
Good roads machinery	10
Shop fixtures and machinery	7
Stationary motors	7
Watchmen's clocks	10
Pipe lines in mines	33⅓
Barber shop fixtures and barber shop	10
MISCELLANEOUS BUILDING AND FIXTURES:	
Theater building	6
Theater building fixtures	6
" " and poolroom	20
Store and office buildings—wood	6
" " " " —stone or brick	5
Furniture and fixtures in same	10
Tenement houses	6
Clubhouse furniture	15

MISCELLANEOUS.—The following is from McKay's "Valuing Industrial Properties":

	Life in Years	Authority
Arc lamps	15	Henry Floy
Box drains	16	H. P. Gillette
Bolts and nut locks	20	Wm. Arthur
Brick platforms and walks	33	"
Bridges:		
Steel	50	"
Concrete and stone	50	"
Wood	8–28	"
Cinders and sand for ballast	6½	"
Cast iron pipe of large diameter	50–75	H. P. Gillette
Cast iron pipe of small diameter	20–40	"
Cribbing and bulk heading	10	"
Cement platform and walks	33	Wm. Arthur
Concrete curbing	20	"
Curbings, wood	20	"
Cinder and gravel platforms and walks with no curbing	22	"
Cinder and gravel platforms and walks with wooden curbing	12	"
Coach and chair cars (salvage value 6% new)	25	"

	Life in Years	Authority
Cables:		
Cables, underground (low tension) (50% of maintenance cost)		Henry Floy
Cables, aerial (telephone)	15	C. W. McKay
Aerial cable (lead covered)	15	Wm. Arthur
Underground (lead covered)	20–25	"
Conduits	100	Henry Floy
Conduits	50	C. W. McKay
Cross arms	8–12	Henry Floy
Culverts:		
Wooden box	10	Wm. Arthur
Cast iron pipe	50	"
Vitrified pipe	20	"
Cement pipe	50	"
Concrete and stone	50	"
Crushed stone and granite ballast	50	"
Docks and wharves	33	H. P. Gillette
Electric light plants, incidental apparatus	12	Wm. Arthur
Electric power plants, incidental apparatus	12	"
Fencing:		
Wooden entirely	15	"
Wooden posts, wire panels	20	"
Cement and iron posts, wire panels	22	"
Fences	14	H. P. Gillette
Frogs—railroad track	32	Wm. Arthur
Gravel and burned clay ballast (Nebraska and similar products)	20	"
Hand cars	14	"
Hydrants	40–50	H. P. Gillette
Howe truss bridges	10	"
Poles and attachments for electric transmission	20	Wm. Arthur
Paving	2	Henry Floy
Paving	2	C. W. McKay
Piping covering	22–25	Henry Floy
Poles:		
Steel	50	"
Wood in concrete	20	"
Wood in earth	12–18	"
Iron	40	"
Wooden	10	Wm. Arthur
Rail	4–10	"
Reservoirs	50–100	H. P. Gillette
Rails, track fastenings, etc	40	"
Rolling stock:		
Open-car bodies	25	Henry Floy
Open-trailer bodies	25	"
Closed-car bodies	20	"
Trucks	20–28	"
Passenger cars (express, baggage, and mail—salvage value 8%)	25	Wm. Arthur
Freight cars	18	"

	Life in Years	Authority
Shop furniture	10	C. W. McKay
Stand pipes	50–100	H. P. Gillette
Steel pipe	25-50	"
Switchboard and wiring	16¼–33⅓	Henry Floy
Spikes	12	Wm. Arthur
Split joints and attachments	19	"
Tunnels (all kinds)	20–50	"
Telephone and telegraph poles and pole attachments	20	"
Telephones	10	Henry Floy
Ties for new track:		
Oak (white)	12	Wm. Arthur
Oak (mixed)	7	"
Fir and pine	6	"
Cedar	12	"
Tamarac	8	"
Hemlock	6	"
Cypress	6	"
Water tanks:		
Wooden	20	"
Steel, including water softeners	33⅓	"
Galvanized iron	10	"
Wind mills	8	"
Wire for telephone and telegraph	25	"
Wire, electric transmission	20	"
Wood stave pipe	25–30	H. P. Gillette
Wrought iron service pipe	15–30	"
Wood sidewalks	12	Wm. Arthur

PAPER MILLS.—The English Inland Revenue permits as maximum rates, 5% reducing balance method for machinery working during the day only, and 7½% for machinery working both night and day.

R. H. Montgomery in "Auditing, Theory and Practice" (1916, p. 418), says that buildings should be depreciated at a very low rate, and equipment at from 3% to 5%. In his "Income Tax Procedure, 1919" (p. 571), he suggests 7½% for machinery running night and day.

The Federal Trade Commission has found that several of our best managed mills allow 5% on their investment, which figure the Commission has adopted as adequate.

H. S. Tiffany, in his "Digest of Depreciations," gives 2½% for brick buildings, and 3½% for frame buildings.

PATENTS.—The following table gives terms of patents and of trade-marks in leading countries:

Country	Term of Patent	Term of Trade-Mark
Great Britain	16 yr.; extended from 14 yr. by act of Parliament, 1919	14 yr. renewable
France	5, 10, or 15 yr. from filing of application	15 " "
Germany	15 yr. from next day after filing	10 " "
Russia	15 "	1 to 10 yr.

Country		Term of Patent	Term of Trade-Mark
Canada	18 "		General unlimited; special 25 yr. renewable
Australia	14 "		14 yr. renewable
Austria	15 "		10 " "
Switzerland	10 "	for chemical process	20 " "
	15 "	from filing	
Sweden	15 "	from filing.	10 " "
Denmark	15 "		10 " "
United States	17 "		20 " "

The duration of patent rights in Great Britain was extended from 14 to 16 years in 1919 (see 9, and 9 and 10, Geo V, c 80 Chitty, Annual Statutes, 1919, p. 423). No corresponding change seems to have been made with respect to trade-marks. Important patent legislation is now pending in France which will radically change the existing law if passed.

The only actual change in duration of patents and trade-marks since 1909 in the countries named seems to have been in Great Britain, as indicated above.[52]

PATTERNS.—L. R. Dicksee suggests a rate of from 25% to 33⅓% for patterns. E. Guthrie suggests 50% the first year, 30% the second, and 20% the third year for designs; and 20% to 30%, reducing balance method, for patterns. R. H. Montgomery says the depreciation charge should usually equal the annual expenditure for new patterns, and that, wherever possible, the total book value should be written down to $1.[53] This policy is pursued by the General Electric Co., which carries patterns which cost nearly $2,000,000 at a net book valuation of $1. C. Piez suggests a rate of 75% on new additions to metal patterns, and a rate of 100% on new additions to wood patterns. J. L. Nicholson and J. F. D. Rohrbach, in "Cost Accounting" (p. 151), suggest the same rates. C. E. Woods suggests a rate of from 33⅓% to 100% per annum.[54]

In general, when patterns are made for a specific order they should be charged wholly to that order, but when they are made for a stock product their future value depends on various considerations.

PIPE.—Cast iron.—In *Spring Valley Water Works* v. *San Francisco*,[55] the district judge found the depreciation of cast iron pipes to be 1% per annum.[56]

Service.—The Uniform Accounts for Systems of Water Supply, Bureau of the Census, gives the life of service pipe as 15 years.

Steam.—The Uniform Accounts for Systems of Water Supply, Bureau of the Census, gives 20 years as the life of steam pipes.

Wood.—The Uniform Accounts for Systems of Water Supply, Bureau of the Census, gives the life of wood pipe as 25 years.

Wrought iron.—In *Spring Valley Water Works* v. *San Francisco*,[57] the district judge found the annual depreciation of wrought iron pipes to be 2%.[58]

The Uniform Accounts for Systems of Water Supply, Bureau of the Census, gives 50 years as the life of iron water pipes.

For much additional data on depreciation of pipes, see "Accountants' Index" (1920, pp. 546-554.)

[56] R. H. Whitten, Vol. I, p. 430.
[57] 192 Fed. 137, decided Oct. 21, 1911.
[58] R. H. Whitten, Vol. I, p. 430.

POWER PLANT.—Foster, in his "Engineering Valuation of Public Utilities and Factories" (pp. 200, 205), gives the following for power plant and substation equipment:

	Annual Rate of Depreciation %
Engines, boilers, heaters, conveyors, pumps, and auxiliaries.	4.5
Rotaries, transformers, switchboards, auxiliaries............	4.5
Storage batteries..	3.0
Turbines and generators....................................	6.0

R. H. Montgomery suggests a rate of 8% for power plant equipment, based on gross book values at end of the preceding year.[59]

M. E. Cooley gave a life of 12½ years to power plant equipment in the *Milwaukee 3-Cent Fare Case.* In the same case, M. G. Starrett gave 20 years as the life of equipment.[60] The Commission accepted 21.01 years.

C. E. Woods gives 10% per annum for power plant.[61]

PRINTING.—The United Typothetae of America, in their Treatise on the Standard Accounting System for Printers (p. 40), give:

	Annual Rate of Depreciation %
Type..	25
Hand composition fixtures.....................	10
Machines......................................	10
Machine composition metal:	
Linotype....................................	2
Monotype....................................	3

The manager of the Philadelphia Printers' Board of Trade says that progressive printers regard depreciation in the composition room as not less than 20%, and of machinery, stands, furniture, etc., 10%. However, many printers make a flat rate depreciation charge of not over 10%, and some go as low as 5%.

The English Inland Revenue permits the following maximum rates on the reducing balance:

	Annual Rate of Depreciation %
Engines, boilers, and shafting..................	5
Printing and binding machines...................	7½
Type..	10

PUBLIC UTILITY COMPANIES.—See "Electric Plants," "Gas Plants," "Telephone Companies," and "Water Works."

Many states now have laws making depreciation reserves compulsory on the part of utility companies. The following quotation from the report of the New York Committee on Accounts and Statistics of Public Utility Companies indicates the tendencies:

> It thus appears that in 15 states there are special enactments requiring the utilities to maintain depreciation reserves or conferring authority upon the supervisory body to make such requirement. Seven additional states have exercised such authority as a matter of

[59] Income Tax Procedure, 1919, p. 563; also 1920, p. 716.
[60] Report of Wisconsin Railroad Commission, Vol. X, p. 226.
[61] Unified Accounting Methods for Industrials, p. 65.

accounting just as the Interstate Commerce Commission has done, without any other or further authority than to regulate accounting procedure. These 22 states embrace most of those that supervise the purely local utilities like gas, electric and water companies. In 16 other states telephone and electric railway companies are subject to the requirement, either under federal or state regulations, while only 9 states (besides Delaware and Utah, which have no state commissions) have not taken action so far as the Committee has information, namely, Connecticut, Georgia, Kansas, Nevada, North Carolina, Oklahoma, Vermont, West Virginia and Wyoming. Certain of these states have no authority to regulate accounting practices; others report that accounting classifications are in course of preparation.

. . . .

In most cases the statutes go beyond the mere requirement of a depreciation account in that they confer power on the commission to fix the rates of depreciation and require the companies to expend the moneys reserved for depreciation under regulations prescribed by the commission.

A review of the action taken by the commissions under these statutes indicates that they are proceeding with caution in establishing rates, and regulations as to the use of depreciation funds. In nearly every state orders have been issued only after thorough investigation in individual cases involving the determination of rates or the approval of security issues. Both the straight-line method and the sinking-fund method of computing depreciation are used —the former in nearly all cases in which reproduction-cost or "value of property" is used as the rate-base and the latter in many cases in which investment is taken as the rate-base.

The following quotation from the laws of New Jersey is typical of state legislation of the compulsory type:

Sec. 17. The board shall have power, after hearing, upon notice by order in writing to require every public utility as herein defined: (f) To carry, whenever in the judgment of the board it may reasonably be required, for the protection of stockholders, bondholders or creditors, a proper adequate depreciation account in accordance with such rules, regulations and forms of account as the board may prescribe. The board shall from time to time ascertain and determine and by order in writing after hearing fix proper and adequate rates of depreciation of the property of each public utility, in accordance with such regulations or classifications, which rates shall be sufficient to provide the amounts required over and above the expense of maintenance to keep such property in a state of efficiency corresponding to the progress of the industry. Each public utility shall conform its depreciation accounts to the rates so ascertained, determined and fixed, and shall set aside the moneys so provided for out of earnings and carry the same in a depreciation fund. The income from investments of moneys shall not be extended (sic) otherwise than for depreciation, improvements, new constructions, extensions or additions to the property of such public utility.

RADIUM.—The Treasury Department has ruled as follows:

Since the full life of radium has been scientifically estimated at such an extended period and since no appreciable depreciation results from its continued use as a therapeutic agent, the depreciation occurring during the lifetime of any individual owner is practically negligible. It is held, therefore, that radium which is used as a therapeutic agent is not subject to depreciation for income tax purposes and its cost must be treated as a capital expenditure. The return of capital will be realized upon its sale or other disposition.[62]

RAILROADS.—The following is from Barker's "Public Utility Rates":

Railways	Life In Years	Authority	Cause
Bridges:			
Steel	20–50	Barker	O.
Wood	10	"	D.
Buildings:			
Office, masonry	70	"	O.
Dwelling, etc.,—wood-frame	30	"	O. or D

[62] Office Decision 837, 10-21-1496.

Railways	Life In Years	Authority	Cause
Stations, masonry	40	Barker	O.
Wood	20	"	O.
Shops, first class	75	Wisconsin R. R. Com.	O.
Second class	50	" " "	D.
Sheds—wood-frame	20	Barker	D.
Cars:			
Freight—wood	10–20	"	D.
Steel	15–30	"	D.
Passenger—wood	20–25	"	O.
Steel	25–30	"	D.
Dining, parlor and sleeping —wood	15–20	"	O.
Steel	20–25	"	O.
Locomotives:			
Freight	15–20	"	D.
Passenger	15–20	"	D.
Switching	20	"	D.
Signals	30	"	O.
Track:			
Rail, main-line tangent	2– 8	"	D. & O.
Main-line curve	1– 5	"	D. & O.
Sidings and yards	10–20	"	D.
Ties—ordinary light wood	5–10	"	D.
Ordinary hardwood	10–15	"	D.
Treated and protected	30	"	D.

NOTE: O. denotes obsolescence. D. denotes depreciation.

The following rates are given by H. L. Gray, in "*Railway Age Gazette,*" May 27, 1910 (pp. 1297–98, 1290), July 8, 1910 (p. 66).

A fair average allowance for depreciation would be:

	Per Cent
Of the cost of property subject to depreciation	5½
" " " " " on electric roads	6½
" " " " " on street railways	5

The following table is used for the state of Washington:

	Annual Rate of Depreciation %
Ballast	8
Ties	15
Rails (main track)	3
Fastenings	5
Frogs and switches	7
Plank paving	8
Track laying	5
Timber tunnel lining	8
Combination bridges	6
Howe truss bridges	9
Pile and frame bridges	10
Wooden culverts	10
Crossings and signs	8

	Annual Rate of Depreciation %
Fences and cattle-guards	8
Telephone and telegraph instruments	6
Poles and fixtures	8
Covered copper feeder	2
Trolley wire	5
Rail bonds	3
Brick buildings	2
Frame buildings	3
Shop machinery	6
Water and fuel stations	4
Roadway tools	10
Interlocking and signal apparatus	7
Substation apparatus	5
Furniture and fixtures	3
Storage batteries	15
Passenger cars (steam)	3
Passenger cars (electric)	5
Freight cars (steam)	4
Freight cars (electric)	4
Steam locomotives	3
Electric equipment of cars	5

In the Texas Midland valuation the life of rails was taken as 40 years.[63]

A study of the rail of the Texas Midland Railroad led to the conclusion that any rail in main-line track could be expected to have a total life of 40 years as new rail before becoming relay; that new rail laid in side tracks could be expected to have a life of 100 years before becoming scrap; and that relay rail would have a life of 60 years before becoming scrap.[64]

The following is quoted from Bulletin of the Investment Bankers Association of America:

Depreciation of Equipment.—The figures furnished by different roads as to the amount charged for depreciation of equipment show a wide variation, and in a great majority of cases, in our opinion, grossly inadequate. We are taking steps that we hope will result in improving this condition. (Vol. IV, p. 96.)

Or again, **accrued depreciation,** which is provided for out of operating expenses, is an accumulative fund of which perhaps 90% is set aside for equipment. But suppose a road with \$60,000,000 of equipment on the rails, \$20,000,000 of equipmemt trusts outstanding, and accrued depreciation of \$30,000,000 —there is no way at present of ascertaining whether the \$30,000,000 has been applied only to the unpledged cars or not, or what specific sum, if any, has been set aside for any particular series of rolling stock in which the banker may have had a selling interest. (Vol. II, No. 4, p. 38.)

The private banking firms handling Equipments all insisted that some provision should be made to provide greater safety for the investor in this class of Security. During the last year a number of situations have come to notice where, when a road has got into financial difficulties, we have found that the equipment pledged under Equipment Trusts has become so depreciated in value as to seriously impair the Security of the Equipment Trust issued against it. When cars were lost or destroyed new equipment has not been added. New equipment has been bought through the issue of new Equipment Trusts instead of money being spent in keeping equipment already owned in proper repair, a more favorable statement of net earnings resulting thereby. Even in an extreme case the actual maturing obligations have been bought in by the Railroad and kept alive instead of being retired and paid off. The fundamental theory of an Equipment Trust by which

63 Interstate Commerce Commission Valuation Docket No. 2, p. 52.

64 *Ibid.*, pp 82–83.

the paying off of a portion of the Trust each year should take care of the depreciation of said equipment, and the Security of the Trust maintained, has thus been violated.

RESERVOIRS.—Most authorities give the life of reservoirs as ranging from 50 to 100 years.

The Uniform System of Accounts for Systems of Water Supply, Bureau of the Census, gives the life of reservoirs, tunnels, and aqueducts as 100 years.

Leonard Metcalf gives 50 to 100 years; C. B. Burdick, 100 years; the California Railroad Commission, 100 years.

RETAIL TRADE.—Ordinarily stock on hand is not supposed to depreciate; yet, while no formal allowance for depreciation thereon is permitted by the Bureau of Internal Revenue, there is a material shrinkage in inventory values which is reflected in the current income account as the result of price reductions made in order to enable merchants to dispose of merchandise which has become shopworn.

R. H. Montgomery gives the shrinkages for retail and department stores, in "Auditing, Theory and Practice" (1916, p. 622), as follows:

	Annual Rate of Depreciation and Shrinkage %
Jewelry	.95
Retail clothing	1.16
Drugs	.47
Department store	1.61
Furniture	2.14
Mail order	.12
Shoes	.50
Vehicles and implements	.62
Dry goods	1.11
Hardware	.52
Variety	.06
Grocery	.76

H. S. Tiffany, in his "Digest of Depreciations" (pp. 13, 16, 17), gives the following:

	Annual Rate of Depreciation %
Dry goods	12½
Wholesale	12½
Retail	25
Wooden and willow ware	10
Queensware	5

also the following (at page 18) for stocks in retail stores:

	Annual Rate of Depreciation %
Boots and shoes (depreciate annually)	15
Clothing (depreciates first year)	20
Clothing (depreciates second year)	30
Dry goods (depreciate annually)	15
Groceries (depreciate annually)	10

	Annual Rate of Depreciation %
Hardware (depreciates annually)	15
Hats and caps (depreciate annually)	20
Laces (depreciate annually)	25
Notions (depreciate annually)	25
Queensware (depreciates annually)	10
Ribbons (depreciate annually)	25
Soap (depreciate annually)	5
Straw goods (depreciate annually)	50
Woolen and willow ware (depreciate annually)	15
Miscellaneous goods (depreciate annually)	20

ROLLING STOCK.—Marwick, Mitchell & Co. gave 20 years as the life of cars, including all equipment in the appraisal of a large street railway system.

In the *Milwaukee 3-Cent Fare Case*, Professor M. E. Cooley gave 12.5 years, W. D. Pence gave 15 to 20 years, M. G. Starrett gave 16.7 years, as the life of cars, bodies, and trucks.

The Wisconsin Railroad Commission has accepted 15 years as the life of car bodies and equipment.

B. J. Arnold, in four Chicago appraisals, stated the life of electrical equipment as 3.3 to 4 to 8.5 years.

Stone and Webster, in a Chicago Traction Case gave the life of electrical equipment as 11.75 to 15 years.

Henry Floy in the Third Avenue Case (New York) gave the life of trucks as 20 years.

The Traction Valuation Commission, Chicago Consolidated Traction Co., gave life of trucks as 30 years.

Marwick, Mitchell & Co. in the appraisal of a large street railway system placed the life of utility equipment at 20 years.

For additional data see "Accountants' Index" (1920, pp. 583–88).

SAWMILLS.—The English Inland Revenue allows the following percentages on the reducing balance method:

	Annual Rate of Depreciation %
Engines, boilers, and main shafting	5
General saw-milling plant and machinery	7½
Traction engines, tractors, motor cars, and haulage plant	20

R. H. Montgomery gives a general rate of 6⅓%.[65]

H. S. Tiffany gives 3½% to 4½% for frame sawmills having steam power, and 2½% to 4½% for those having water power.

The Uniform Cost Sheet for Coal Mining Companies, *Coal Age*, Sept. 19, 1918 (pp. 545–47), gives 10% on original cost for sawmills.

SHIPBUILDING.—The following data are from the table of rates of depreciation recommended by the committee on depreciation of the Atlantic Coast Shipbuilders' Association, Dec. 11, 1918, in its "Cost Accounting and Shipbuilding" (pp. 48–50):

Recommended that the straight-line method of charging off depreciation be adopted. That the normal rates of depreciation be increased to cover overtime depreciation, this

[65] Income Tax Procedure, 1920, p. 724.

increase being at a rate of 6¼% of the normal rate for each hour of overtime; all time in excess of the standard eight-hour day being considered overtime, in this connection. This rate of increase corresponds to 100% increase in normal rates when the plant is operated for the full 24 hours.

General Classification	Life in Years	Annual Rate Depr.
Buildings:		
Stone, brick, concrete with or without steel frame and masonry curtain wall buildings	30	$3\frac{1}{3}$
Steel with corrugated sheet iron or steel plate	20	5
Steel or corrugated sheet iron with wood	15	$6\frac{2}{3}$
Power plant buildings	20	5
Wood buildings	10	10
Piers, bulkheads, wharves and docks	20	5
Launching ways (fixed structure) wood	10	10
Concrete	$13\frac{1}{3}$	$7\frac{1}{2}$
Water tanks and steel stacks	15	$6\frac{2}{3}$
Drydocks, basin, masonry or concrete	40	$2\frac{1}{2}$
Wood	25	4
Concrete and brick bins, fences and miscellaneous concrete and brick structures	20	5
Wood bins, fences, racks and other wood structures	5	20
Power Machinery:		
Electric generators, switchboards, and power house equipment: boilers and boiler house equipment, including economizers feed water heaters, injectors, stacks, uptakes, etc.	15	$6\frac{2}{3}$
Engines, gas and oil	$11\frac{3}{4}$	$8\frac{1}{2}$
Engines, steam, including pile drivers, hoisting engines, compressors, air pumps, vacuum pumps, etc.	10	10
Pumps, water supply, feed water, fire, etc.	18	$5\frac{1}{2}$
Electric motors and controllers	$11\frac{3}{4}$	$8\frac{1}{2}$
Coal and ash conveyors	20	5
Shop Machinery:		
Hydraulic forging presses, bending presses and fluid compressors	30	$3\frac{1}{3}$
Hammers, steam drop or helve	10	10
Machine tools, lathes, slotters, planers, boring mills, drilling, boring and milling machines	15	$6\frac{2}{3}$
Miscellaneous shop machinery and equipment, including small scales, spare parts, etc.	5	20
Woodworking machinery	20	5
Small tools	10	10
Cranes, Elevators, etc.:		
Cranes, electric, hydraulic, steam and hand power, jib and davit; hand, electric or air hoists, derricks, lifting magnets and charging machines	15	$6\frac{2}{3}$
Locomotive cranes, steam and electric	10	10
Elevators	20	5
Craneways	25	4
Portable pneumatic, electric and hydraulic tools; portable, hand, electric, hydraulic or pneumatic hoists and lifting devices; small jib cranes	3	$33\frac{1}{3}$

General Classification	Life in Years	Annual Rate Depr. %
Furnaces and Forges:		
Heating, treating and annealing furnaces, brass foundry melting furnaces, oil furnaces, etc.	10	10
Blast furnaces, stacks and stoves, soaking pits, open hearth and crucible melting furnaces, cupolas, etc.	25	4
Formers and drop forge dies	5	20
Other Equipment:		
Railroad tracks, including rails, ties, ballast, excavation, grading, etc.	22	4½
Trestles, steel	25	4
Wood	15	6⅔
Bridge and retaining walls	33⅓	3
Marine railways	30	3⅓
Fire systems and apparatus	5	20
Piping and wiring; piping for steam and exhaust, air, oil, gas and water lines, pneumatic and hydraulic transmission, electric light and power systems, wiring, feeder and other outside wiring, including poles	16⅔	6
Heating and ventilating systems, drying apparatus	20	5
Sanitary and water supply systems, sewers and drainage systems	25	4
Floating equipment, barges, boats, scows, motor-boats	5	20
Portable launching ways	5	20
Floating drydocks	20	5
Stable and garage equipment	3	33⅓
Motor trucks and automobiles	3	33⅓
Locomotives, steam and electric	15	6⅔
Cars used by transportation department	10	10
Scales, large	10	10
Water purifier	15	6⅔
Pickling tanks, etc.	3	33⅓
Furniture and Fixtures:		
Office equipment, shop, yard, store and tool room fixtures, typewriters, adding machines, etc., lockers, wardrobes, etc.	5	20

SHIPS.—The Federal Income Tax Department of Australia has allowed the following rates, reducing balance method. Repairs are allowed in addition.

	Annual Rate of Depreciation %
Launches	6
Ships	6
Steamers	6
Lugger	7½
Lighters—wooden, for conveyance of gaseous liquor	6
Coal	10
Constructed of iron or steel	6
Punts	6

J. D. S. Bogle gives the average life of steamers as about 20 years, and considers 6% to 7% a fair rate of depreciation.

The following rates are provided by large companies:

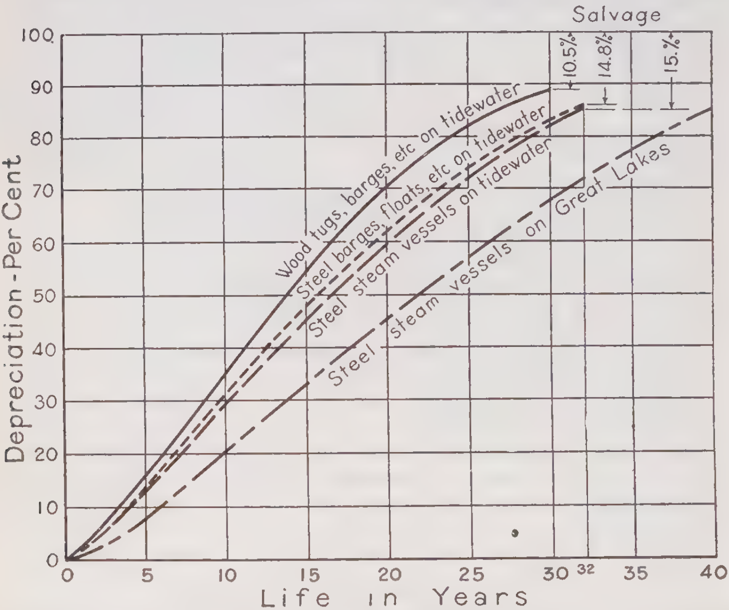
P. and O. Co. writes off 5%; also carries sums to suspense account.

Houlder, Ltd., under trust deed must provide 5%.

Cunard Line provides nearly 5%.

Royal Mail S. P. Coy provides slightly more than 5%.

The Hamburg-American Co., during the period 1903–1913, allowed on an average of $4.11 per ton per annum for depreciation. For the same



Form 9. Chart showing Rate of Depreciation of Vessels on the Great Lakes and Tidewater

period the International Mercantile Marine Co. made the inadequate average allowance of $2.35 per ton.[66]

The Royal Mail Packet Co. in 1914 allowed slightly more than 5% on first cost.

The White Star Line in 1914 allowed 4% on original first cost and betterments, a comparatively low allowance.

The diagram in Form 9, reproduced from Gillette and Dana's "Handbook of Mechanical and Electrical Cost Data," shows the life and manner of depreciation of vessels on the Great Lakes and tidewater.

The English Inland Revenue allows as maximum rates 4% on the prime cost of steamships, and 3% on the prime cost of sailing vessels. With regard

[66] E. A. Saliers, in *Journal of Political Economy*, Vol. XXIII, p. 917.

to ships bought second hand at prices in excess of the written-down value at the date of purchase, the following arrangements have been made:

(a) The allowance is made on the actual cost price of the ship to the owner for the time being without regard to the prime cost to a previous owner.

(b) The rate of depreciation allowable is calculated by reference to the reasonable expectation of the life of the ship at the date of purchase from the previous owner.

During the war the United States Shipping Board allowed 10% for depreciation on an inflated valuation of commandeered vessels of approximately $175 per ton, which was more than twice their original cost.

At a conference of the president of the Ship Owners' Association of the Pacific Coast, professional accountants representing that association, and officials of the Bureau of Internal Revenue, it was agreed that the proper annual rate for steam schooners engaged in the coastwise lumber trade is 5%, based upon an expected life of 20 years.[67]

STEAM PLANTS.—The following is from Nicholson and Rohrbach's "Cost Accounting":

	Annual Rate of Depreciation
STEAM PLANT EQUIPMENT:	%
Steam power plant, including boilers and piping	6
Boilers	5
Boilers—including boiler house equipment, such as economizers, feed water heaters, injectors, damper regulators, etc. (does not include feed water pumps)	5½
Water purifying plant	5½
Engines	5
Steam turbines	5
Condensers	6
Piping	7½
Superheaters	5
Stokers—fixed parts	5
Stokers—moving parts	20

TELEPHONE COMPANIES.—The following is from Barker's "Public Utility Rates" (1917, p. 369):

TELEPHONE UTILITIES	Life in Years	Authority	Cause
Buildings	40	Chicago Tel. Com.	O.
Cables:			
Lead-covered aerial	12	Wisconsin R. R. Com.	D. & O.
Lead-covered under-ground	20	" " "	O. & D.
Central exchange equipment	10	" " "	O. & D.
Conduit	50	Chicago Tel. Com.	O.
Cross arms	8–12	Wisconsin R. R. Com.	D.
Furniture and tools	7	" " "	D.
Poles, wood in earth	12–15	" " "	D.
Power plant	8	" " "	D. & O.
Private-branch exchange equipment	8	Chicago Tel. Com.	D. & O.
Substations (subscribers')	10	Wisconsin R. R. Com.	D. & O.
Wire:			
Copper, line	40	Chicago Tel. Com.	O.
Copper, interior	30	" " "	O.
Galvanized iron, line	8–15	Wisconsin R. R. Com.	D. & O.

[67] Committee on Appeals and Review Memorandum 279, 42-20-1245.

Note that in some cases obsolescence is the controlling factor in the above table.

The following is from *Telephony*, Apr. 1, 1911 (pp. 401–3), estimated depreciation, schedule on an illustrative telephone plant:

	Annual Rate of Depreciation %
Poles and guys	6
Cable	2
Cable, messenger, hangers, labor, etc.	8
Cable terminals	7
Cross arms, hardware, insulators, pins, etc.	7
Line wire, copper	2
Drop wire and fastenings	8.5
Interior wire and fittings	8
Telephones and equipment	6
P. B. X. switchboards	7
Switchboards	7
Terminals, racks and machines	7
Batteries	18
Warehouse stock	3

For additional references and a very complete digest of public utility cases the reader should consult the "Accountants' Index" (pp. 622–634). The following may be noted:

In a Massachusetts telephone appraisal for rate purposes in 1909, 7.3% on the value of the property, exclusive of land, general supplies, and working capital (net current assets and cash on hand) was figured as the average yearly reconstruction cost.[68]

In an Oklahoma Telephone Rate Case in 1911, 7% on the reproduction value of physical property was regarded as a fair and sufficient allowance for depreciation.[69]

In a Louisville, Ky., Rate Case in 1911, 7% on the depreciated property was allowed, on the theory "that the average life of the combined elements which make up the plant is about fourteen years."

The California Commission allowed 5.5%, but the base was not certain, probably original cost.[70]

The Canada Board of Railway Commissioners allowed 6.77% on the book value of depreciable property in 1914.

In a Nebraska Telephone Case in 1914, $5.51 per subscriber's station was allowed.[71]

In an Oklahoma rate case, 10 years was accepted as the life for inside equipment.

Note: D. denotes depreciation. O. denotes obsolescence.

The following is quoted from Uniform Accounts for Systems of Water Supply, Bureau of the Census:

Until further study and experience or a series of inspections and appraisals at fixed intervals furnish more accurate data, the average life of the various parts of the fixed properties of a water-supply enterprise may be assumed to be approximately as follows: For horses, carriages, automobiles, and laboratory apparatus and appliances, 10 years; water meters, service pipes, office furniture, and general operating equipment, 15 years; boilers, steam pipes, and filtration equipment, 20 years; engines, pumping machinery, and wood pipes, 25 years; masonry of filtration plant, cribs, iron water pipes, intakes and connections, fire hydrants, standpipes, and buildings, 50 years; reservoirs, tunnels, and aqueducts, 100 years; and for the water-supply system as a whole, 50 years. All these approximations are subject to modification by reason of any unusual conditions which may shorten or prolong the life estimated above.

In the *Des Moines, Iowa, Water Rate Case*, in 1910, an allowance of about 1% on the estimated present value of physical property subject to depreciation was granted.[72]

In the *San Francisco Water Rate Case*, in 1911, the district judge said:

I find the annual depreciation of this plant to be 1 per cent. per annum for cast iron pipe, 2 per cent. for wrought iron pipe, 2.5 per cent. for pump engines, flumes and wooden structures, and 5 per cent. for boilers.

In Wisconsin, in 1912, 0.8% was allowed on reproduction cost new.[73]

SECTION 12

GOOD-WILL

CONTENTS

SECTION 12

GOOD-WILL

DEFINITION.—"Good-will, in its commercial sense, is the present value of the right to receive expected future super-profits, the term 'super-profits' meaning the amount by which future revenue, increase, or advantage, to be received, is expected to exceed any and all economic expenditure incidental to its production."[1]

Leake's definition is sufficiently comprehensive to include all elements usually regarded as creating good-will. Chief among these are: **good name, reputation, business connections, custom, individuality,** and **locality.** No present value in good-will exists unless expected future revenue exceeds cost of producing it (including current expenses, depreciation, cost of management, and interest on capital). The **interest rate** to adopt depends on what rate is necessary to attract capital to the undertaking in question. Having regard to risk involved, rate of return on investments varies from, say, 4½% where element of risk is negligible to, say, 7%, where risk incident to ordinary industrial undertakings is present. Before a good-will value can be said to exist it must be shown that expected future yearly profits will exceed **normal hire** of invested capital in industry in question, because this normal hire can be obtained by capital at any time without payment of a premium. Payment for good-will is equivalent to payment of a premium.

Definition Illustrated.—Since good-will is present value of expected future super-profits, it is the present value of an ordinary annuity equal to the annual

	1st Yr.	2nd Yr.	3rd Yr.	4th Yr.	Int.	Total.
Present value of $1 annual instalments	$0.952	$0.907	$0.863	$0.823		$3.55
One yr. int. 5%	.047	.045	.043	.041	.176	
1st yr	$1.00	$ .952	$ .906	$ .864		
One yr. int. 5%		.048	.045	.043	.136	
2nd yr		$1.000	$ .951	$ .907		
One yr. int. 5%			.048	.045	.093	
3rd yr			$1.00	$.952		
One yr. int. 5%				.048	.048	.45
4th yr				$1.000		$4.00

[1] P. D. Leake, Good-Will: Its Nature and How to Value It, p. 4.

share of future super-profits. The present value is less than the sum of the future yearly amounts of such annuity. This difference is due to the fact that \$1 due a year hence is less than \$1 due now, because if money is worth 5%, \$1 due now will be worth \$1.05 a year hence. Taking interest at 5%, the present value of an annuity of \$1 for 4 years is \$3.55. This value is secured by adding together a number of units each representing the present value of a future year's annuity, as shown in preceding table.

The sum of the present values, \$3.55, plus the sum of interest, \$0.45, amounts to \$4, the sum of the four annuity instalments. The present worth of each instalment is less than the preceding one, because the time elapsing is one year longer in each case, thus allowing more compound interest to be earned.

The vendor of good-will receives its present worth plus the power to earn interest on the money thus received. This is shown in the following table, assuming that the good-will paid for is the present worth of an annuity of \$1 for four years.

	1st Yr.	2nd Yr.	3rd Yr.	4th Yr.	Total.
Present value paid to vendor	\$0.952	\$0.907	\$0.863	\$0.823	\$3.55
Interest at 5% which vendor can earn on amount of each unit between present date and date when each \$1 he sells is receivable	0.048	0.093	0.136	0.177	0.45
	\$1.00	\$1.00	\$1.00	\$1.00	\$4.00

NATURE OF GOOD-WILL.—Value of good-will is the present value of an annuity equal to an annual share of future super-profits. In fixing a selling price the vendor cannot expect to obtain the present worth of total future super-profits, because he must leave enough to induce another to purchase them. Probably one-half is as much as he should expect to secure. Moreover, he should receive, not the full amount of his share, but only its present value.

Good-will is temporary in character because of the temporary character of super-profits. Super-profits are temporary because of the effects of competition, which ultimately reduces earnings to a rate of profit equal to the normal rate of interest on invested capital, with due regard to the character of the risk. Super-profits, upon which good-will is based, should be regarded, not as a perpetuity, but as an annuity extending for a limited although unknown term of years.

WHAT GOOD-WILL COMPRISES.—Good-will includes a wider range of elements than was formerly assigned to it. Chief among these additional elements are:

1. Right to carry on manufacture, trade, and commerce; to enjoy benefits of current contracts including leases; and to use of trade-marks and trade-names.
2. Monopoly rights.
3. Copyrights.
4. Patents.

With the exception of the right to exercise monopoly, all of these values originate in personal skill and ability.

Good-will arises not only out of past work of business managers, but also out of past work of men engaged in pursuits in no way related to management. Past work of an inventor gives rise to good-will in the form of patent rights. Past work of an author gives rise to good-will in the form of copyrights.

Valuation of Good-Will

GENERAL REMARKS.—Valuation of good-will involves determination of the present value of an enterprise's excess earning power. Elements are sometimes included in good-will which are not related to it in any way; also there is sometimes a failure to recognize good-will where it exists. This is due to the tendency to regard good-will as the capitalization of excess earnings. This tendency has increased in the face of the **court definitions** to the effect that good-will is to be identified with location, reputation, commercial standing, and so on. It is not possible to reconcile the definitions with the method commonly accepted by the court, which measures the value of good-will by some multiple of the excess of average annual profits for a period of past years in excess of interest on invested capital plus cost of management. The factors usually mentioned in the definitions do, however, usually tend to create the excess earning power which in practice is made the basis of its valuation.

WHERE VALUATIONS REQUIRED.—Good-will valuations may be required under the following circumstances:

1. Upon the purchase of an enterprise by another concern or when a merger takes place.
2. Upon the incorporation of an enterprise.
3. Upon the admission of a partner to a partnership.
4. Upon the dissolution of a partnership, resulting from the death of a partner, the voluntary retirement of a partner, or the bankruptcy of a partner.
5. As a matter of routine policy.
6. Upon the purchase of a professional practice.

EXCESS EARNING VALUATION BASIS.—Since it has become the almost universal rule to value good-will on basis of earning in excess of interest on investment and a fair allowance for managerial services, the four following factors must be considered:

1. Value of net assets of business as a going concern.
2. Earning power of business.
3. The rate of interest to allow as a return on net investments.
4. The number of years' purchase of profits to take.

1, 2. To determine **net investment** it is necessary to arrive at a mutual agreement or else secure an expert appraisal of the fixed assets and a valuation by accountants of current and working assets. It may be necessary to make certain adjustments in the balance sheet items. Thus, if leases have not been carried at any figure, they should be given a figure and brought into the balance sheet. A revaluation of timber lands or of mineral rights may be desirable if these have increased from a low valuation to one based on surveys and estimates by engineers. Various changes may be necessary to allow for **amortization** or **depreciation.** Present, not past, conditions with respect to depletion, depreciation, and amortization must be considered, because it is

under these conditions that the future income of the business will be considered. If extraneous items are found among the assets they should be carfully considered. If a reserve fund exists which produces an income lower than normal rate of profit, this should be excluded in considering both principal and income. But if investments yield a return equivalent to ordinary commercal return upon capital, it is not necessary to eliminate them. Caution should be exercised in eliminating assets which represent a dead expense because ownership of them frequently contributes indirectly to the profits of a business.

In manufacturing it is sometimes advisable to construct facilities of sufficient capacity to meet growth in demand which will extend over a period of 5 years or more. Before doing this a reasonable estimate of increased volume of business must be secured. In valuing good-will, cost of maintenance, overhead, and insurance of temporarily unused facilities should not be charged against profits, nor should interest on excess capital invested be deducted in arriving at excess profits upon which valuation of good-will is based. Instead, valuation should be made upon basis of facilities employed.

3. **Proper rate of return on investment** is normal rate at which capital can be secured for the enterprise in question at date of good-will valuation. This varies with nature of business, kind of assets involved, and ratio of earnings to assets. There are certain limits within which capital can be raised by sale of bonds. Likewise there are certain limits within which preferred stock can be sold. These limits vary at different times, being affected by the conditions of the money and the investment market. If capital can be secured for industrial purposes by issuing 7% preferred stock to amount of the tangible assets, provided the dividend has been earned on an average of at least 4 times over a series of years, 7% is the rate to charge on tangible assets in valuing good-will. Again, if a 5% bond could be sold equal in amount to 40% of tangible assets, a 6% preferred stock for another 40% of tangible assets, and if common stock paying 10% were issued for the balance of tangible assets and good-will, then the average rate of 6⅗% would be a proper rate to use, provided certain ratios of earnings to interest charges and good-will could be shown.

For valuing good-will the **legal rate** should not be regarded as the **normal rate,** although in a number of New York decisions 6% was adopted.

The Treasury Department has advocated a rate of 10%. In stable business this is reduced to 8% or 9%.

4. The **number of years' purchase of profits to take** is the least settled point in good-will valuation. Its determination is partly a matter of judgment. The transferability of the good-will must be considered. Some kinds of good-will are **personal,** attaching to the individuals who create them. Others are readily transferrable to a vendee. Again, some good-will is **institutional,** as distinguished from that attaching to a single product. Good-will attaching to the name of Heinz is institutional because it helps the sale of any product coming under that name. Good-will attached to the **name of a particular product,** as *Danderine* or *Cascarets* is not institutional and has a more limited application. Institutional good-will should be valued at a greater number of years' purchase than good-will which rests upon a single brand of goods.

If good-will is nation-wide or world-wide it should be valued upon a greater number of years' purchase than if it is of only local extent. Good-will of a chain store should be valued on the basis of a higher multiple of average profits than should good-will of one large store with a more limited market.

Tending to create a higher purchase of good-will are: wide distribution in proportion to volume of product; wide variety of products sold under an institutional name; staple products in general demand by buying public; increasing volume of business. The last factor may be considered in applying the usual formula, or it may be considered as an independent factor. Possibility of adverse legislation may be a factor.

In fixing an allowance for managerial services, give consideration to character of business, i.e., whether staple or otherwise; to kind of training required of manager; and to usual standard of compensation for services established in similar lines of business.

It is sometimes necessary to make certain variations from the results shown in profit and loss accounts when determining net profits, with a view to ascertaining a certain number of years' purchase price.

At formation of the International Harvester Co. the good-will of the merging concerns was fixed by adding to the sum of profits of the two preceding years an additional 10% thereof. This method is fairly common among manufacturers. But in ascertaining net profits certain classes of income and expenditure were not included, among these being interest on accounts and bills receivable, on certain accounts payable, and also cost of collecting receivables. Depreciation was not deducted in determining value of good-will. Consequently, profits figure employed in placing a valuation on good-will was larger than that shown in Profit and Loss account.

The courts generally have not approved valuations based on more than 5 years' purchase, although in New York the Appellate Court in *Von Au* v. *Magenheimer*,[2] permitted a multiple of 6 years' purchase; while in valuing the good-will of Tiffany & Co. a multiple of 10 was approved.[3] This is the maximum multiple permitted by the court. The court recognized, however, that in most American cases a period ranging from 2 to 6 years is adopted, the number being dependent upon the nature of business, length of time it has been established at a given place, and extent to which it is known to the public. The tendency to go beyond the 5-year rule is justified by the increasing stability of forms of industrial organization and to improvement made in training executives. The accompanying chart reproduced from *System*, Jan., 1912, shows multiples employed in estimating good-will of various enterprises.

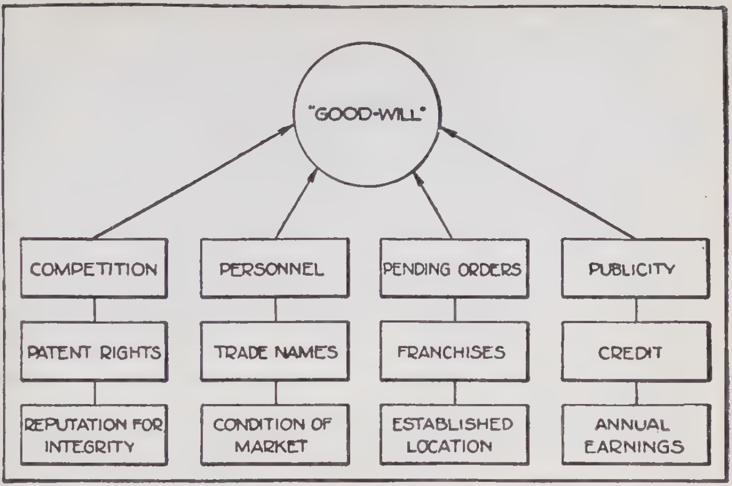
It is not desirable to employ as high a multiple against excess earning power when excess earnings are large, as when comparatively small; and it may be desirable to use different rates for different parts of such excess earnings. Suppose Company A has earnings of $10,000 in excess of a normal return of 7% on its net worth. If it is desirable to multiply such excess of $10,000 by 5 to determine value of good-will, or, as technically known, 5 years' purchase price of excess profits, then were average earnings $20,000 instead of $10,000 it would not be desirable to multiply the total $20,000 by 5, but to multiply first $10,000 by 5 and remaining $10,000 by, say, 3, thus securing a figure of $80,000, instead of $100,000, for good-will. Each additional block of excess earnings should be taken at a still lower rate. In general terms, the greater the surplus earnings as related to normal profits, the lower should be the rate by which they should be multiplied.

VALUATION ILLUSTRATED—SALE OF PARTNER'S INTEREST.— The following illustration of valuation of good-will in case of sale of one part-

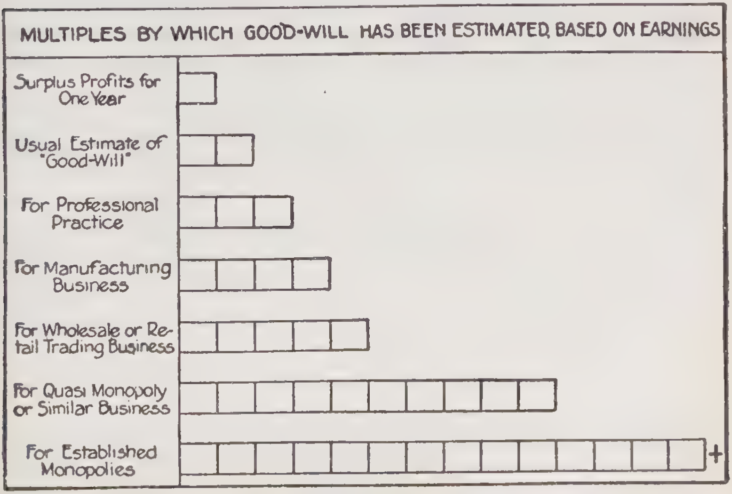
---

[2] 126 App. Div. 257.

[3] *Matter of Moore*, Misc. 238; 167 Supp. 213."



Some of the factors that enter into a computation of the "good-will" of a business. For obvious reasons these factors vary greatly in importance, dependent upon the peculiar conditions that affect the business that enters into the transaction.



The first rule in computing "good-will" is to determine the net earnings of a business, from which sum is deducted the interest on capital actually employed and the value of the owner's services. The result, multiplied ordinarily by two but sometimes by many times that amount, has been accepted as the value of the "good-will."

NOTE.—The above charts are reproduced by permission from *System* for January, 1912.

ner's interest in professional practice to another partner shows application of principles involved.

Assume that after allowing for interest on capital at the rate of 6%, but before allowing any sum for partners' services, average annual profits are $20,000. There are two equal partners, one of whom is to retire and will sell his share to the other partner. It is agreed to deduct $3,000 each per annum for personal services of partners. This leaves $20,000 – $6,000, or $14,000 as **super-profits.** One-half of this, or $7,000, belongs to the outgoing partner. He cannot expect, however, to receive $7,000 for it, otherwise there would be no inducement for the other partner to buy it. Probably he will be satisfied with ½ of it, or $3,500. It is now necessary to secure present worth of this super-profit. This depends upon the number of years the super-profit may reasonably be expected to continue as the result of past work and of the influence of the retiring partner. Suppose 10 years is agreed upon. The present value of an annuity of $1 for 10 years is $8.1109; therefore, present value of an annuity of $3,500 for 10 years is 3,500 × 8.1109 = $28,388.15, which, according to assumptions made, is price retiring partner should receive for his share of good-will. This is not quite three times former annual profits of the retiring partner.

VALUATION ILLUSTRATED—SALE OF FIRM'S BUSINESS.—The following illustrates method of using the year's purchase plan of valuing good-will in case of purchase of business and good-will of a firm by a corporation.

Company Y agrees to purchase business and good-will of X firm, the good-will to be determined on the basis of 4 years' purchase of average profits for past 10 years in excess of a normal rate of 7% on net worth of firm. Net worth of the firm is $200,000, and average annual profits for 10-year period are $27,000. From $27,000 deduct 7% of $200,000, or $14,000, leaving average excess of profits above normal at $13,000. This multiplied by 4 gives 4 years' purchase, or $52,000, as value of good-will.

FEDERAL VALUATION OF GOOD-WILL.—The problem of good-will valuation arises in connection with federal taxation of income. Treasury regulations not inconsistent with the laws have the force of laws. Its various informal rulings, however, are usually regarded as being merely statements of temporary positions. The Committee on Appeals and Review says [4]

> At the outset, the Committee desires it to be understood that in using the term "good will" it intends the term to be given not merely the narrow and technical meaning which has been attached to it in numerous court decisions, but to include as well the intangible value which always attaches to a more than usually profitable enterprise by reason of its proven earning capacity.

The Treasury throws the burden of proof of fair market value of good-will as at Mar. 1, 1913, on the taxpayer.

Three methods of checking soundness of taxpayers' methods of valuing good-will have been provided by the Committee on Appeals and Review, as follows:[5]

> The Committee has considered the question of providing some practical formula for determining value as of March 1st, 1913, or of any other date which might be considered as applying to intangible assets, but finds itself unable to lay down any specific rule which would be applicable in all cases and under all circumstances. Where there is no established market to serve as a guide the question of value, even of tangible assets, is one largely of judgment and opinion, and the same thing is even more true of intangible assets

[4] Cumulative bulletin No. 3, July–Dec. 1920, p. 47 (A. R. R. 252).

[5] A. R. M. 34, Cumulative Bulletin No. 2, p. 31.

such as good will, trade-marks, trade brands, etc. However, there are several methods of reaching a conclusion as to the value of intangibles which the Committee suggests may be utilized broadly in passing upon questions of valuation, not to be regarded as controlling, howeve , if better evidence is presented in any specific case.

Where deduction is claimed for obsolescence or loss of good will or trade-marks, the burden of proof is primarily upon the taxpayer to show the value of such good will or trade-marks on March 1, 1913. Of course, if good will or trade marks have been acquired for cash or other valuable considerations subsequent to March 1st, 1913, the measure of loss will be determined by the amount of cash or value of other considerations paid therefor, and no deduction will be allowed for the value of good will or trade-marks built up by the taxpayer since March 1, 1913. The following suggestions are made, therefore, merely as suggestions for checks upon the soundness and validity of the taxpayers' claim. No obsolescence or loss with respect to good will should be allowed except in case of actual disposition of the asset or abandonment of the business.

In the first place, it is recognized that in numerous instances it has been the practice of distillers and wholesale liquor dealers to put out under well known and popular brands only so much goods as could be marketed without affecting the established market price therefor and to sell other goods of the same identical manufacture, age, and character under other brands, or under no brand at all, at figures very much below those which the well known brands commanded. In such cases the difference between the price at which whisky was sold under a given brand name and also under another brand name, or under no brand, multiplied by the number of units sold during a given year gives an accurate determination of the amount of profit attributable to that brand during that year, and where this practice is continued for a long enough period to show that this amount was fairly constant and regular and might be expected to yield annually that average profit, by capitalizing this earning at the rate, say, of 20 per cent, the value of the brand is fairly well established.

Another method is to compare the volume of business done under the trade-mark or brand under consideration and profits made, or by the business whose good will is under consideration, with the similar volume of business and profit made in other cases where good will or trade-marks have been actually sold for cash, recognizing as the value of the first the same proportion of the selling price of the second, as the profits of the first attributable to brands or good will, is of the similar profits of the second.

The **third method,** and possibly the one which will most frequently have to be applied as a check in the absence of data necessary for the application of the preceding ones, is to allow out of average earnings over a period of years prior to March 1, 1913. preferably not less than five years, a return of 10 per cent upon the average tangible assets for the period. The surplus earnings will then be the average amount available for return upon the value of the intangible assets, and it is the opinion of the Committee that this return should be capitalized upon the basis of not more than five years' purchase —that is to say, five times the amount available as return from intangibles should be the value of the intangibles.

In view of the hazards of the business, the changes in popular tastes, and the difficulties in preventing imitation or counterfeiting of popular brands affecting the sales of the genuine goods, the Committee is of the opinion that the figure giving twenty per cent return on intangibles is not unreasonable, and it recommends that no higher figure than that be attached in any case to intangibles without a very clear and adequate showing that the value of the intangibles was in fact greater than would be reached by applying this formula.

The foregoing is intended to apply particularly to businesses put out of existence by the prohibition law, but will be equally applicable so far as the third formula is concerned, to other businesses of a more or less hazardous nature. In the case, however, of valuation of good will of a business which consists of the manufacture or sale of standard articles of every-day necessity not subject to violent fluctuations and where the hazard is not so great, the Committee is of the opinion that the figure for determination of the return on tangible assets might be reduced from 10 to 8 or 9 per cent, and that the percentage for capitalization of the return upon intangibles might be reduced from 20 to 15 per cent.

In any or all of the cases the effort should be to determine what net earnings a purchaser of a business on March 1, 1913, might reasonably have expected to receive from it, and therefore a representative period should be used for averaging actual earnings,

eliminating any year in which there were extraordinary factors affecting earnings either way. Also, in the case of the sale of good will of a going business the percentage rate of capitalization of earnings applicable to good will shown by the amount actually paid for the business should be used as a check against the determination of good will value as of March 1, 1913, and if the good will is sold upon the basis of capitalization of earnings less than the figures above indicated as the ones ordinarily to be adopted, the same percentage should be used in figuring value as of March 1, 1913.

To the above ruling there have been published other amendatory rulings among the most important of which are:

In determining the value of a corporation's assets, including good will, as of March 1st, 1913, contemporary sales of stock are held to be of greater weight than values based on appraisal.[6]

The Committee is in receipt of a request for advice as to whether under A. R. M. 34 the 10 per cent upon tangible assets is to be applied only to the net tangible assets or to all tangible assets on the books of the corporation, regardless of any outstanding obligations.

The Committee, in the memorandum in question undertook to lay down a rule for guidance in the absence of better evidence in determining the value as of March 1, 1913, of good will, and held that in determining such value, income over an average period in excess of an amount sufficient to return ten per cent upon tangible assets should be capitalized at twenty per cent. Manifestly, since the effort is to determine the value of the good will and therefore the true net worth of the taxpayer as of March 1, 1913, the ten per cent should be applied only to the tangible assets entering into net worth, including accounts and bills receivable in excess of accounts and bills payable.

In other words, the purpose and intent are to provide for a return to the taxpayer of ten per cent upon so much of his investment as is represented by tangible assets and to capitalize the excess of earnings over the amount necessary to provide such return, at twenty per cent.[7]

In applying the third method outlined in A. R. M. 34 (C. B. 2, p. 31) of determining value as of March 1st, 1913, of intangible assets, individuals or partnerships in determining net earnings should deduct a reasonable amount on account of the salaries of owners actively engaged in the business.[8]

In determining the value of good will as of March 1, 1913, in accordance with the third method outlined in A. R. M. 34 (C. B. 2, p. 31), and as a factor in the ascertainment of the value of a share of stock as of that date, a corporation which had not been in existence for a period of five years prior to that date was permitted to take the average earnings of the business for five years, thus including a part of the period of the partnership organization that preceded incorporation.[9]

The Committee in A. R. R. 252, Cumulative Bulletin 3 (p. 47), gives a definite example of a method to be employed when good-will is to be valued in a given case in which it was necessary to value good-will as one of the elements making up the value of closely held stock:

The Committee has had under consideration the appeal of A from the action of the Income Tax unit in determining the value of certain shares of stock in the M. Company owned by him March 1, 1913, and sold in 1916.

The difference between the market value of property owned on March 1, 1913 (with, in some cases, proper adjustments for depreciation, etc.), and its selling price determines the profit or loss, as the case may be. In any case, therefore, of the sale subsequent to March 1, 1913, of assets owned on that date, it is necessary to determine the market value of those assets on that date.

The Committee is of the opinion that the market value of shares of stock was what they would bring, and that the best evidence of what they would bring is what such shares did in fact bring them when offered for sale about that time in a free and open market. However, in the present instance, it is understood that there were no sales, and it is neces-

[6] Cumulative Bulletin No. 1, p. 73. This ruling was published before A. R. M. 34 but is still held sound.

[7] A. R. M. 68, Cumulative Bulletin No. 3, p. 43.

[8] Cumulative Bulletin No. 4, p. 43, O. D. 937.

[9] Cumulative Bulletin No. 5, p. 54, O. D. 1146.

sary to apply other tests, the market value in such case being deemed to be what a willing buyer might reasonably have been expected to pay or a willing seller to accept for the stock.

. . . . A prudent investor contemplating an investment, usually takes into consideration primarily two factors: First, the safety of his capital, and second, the return on it which he may reasonably expect. It is axiomatic that the greater the risk the less the price, and consequently he would be satisfied with a lower return upon an investment which is amply secured by tangible salable assets behind it than he would be from an investment made chiefly because of anticipated profits.

Applying the above principles to the case under consideration, we find that in 1916, all of the stock of the corporation in question was sold for the sum of 1,200x dollars. At the time of the sale, the value of the tangible assets of the corporation as shown by the books was 610x dollars. There was paid therefore, for the intangible asset referred to above as good will the sum of 590x dollars. Accepting the figures submitted by the taxpayer and the computations based thereon as correct, it appears that the average tangible assets for the period of three and one-third years prior to the sale was 586x dollars, and that the average annual net income for the same period was 112x dollars. In A. R. M. 34, approved by the Commissioner, the rule has been laid down that in a hazardous business the investor should have at least 10 per cent upon his tangible assets, and that in a stable line a less return would be satisfactory. It could hardly be contended that in 1913 to 1916, the business of manufacturing automobiles, where the company was putting out a car of recognized merit, with a wide demand, was particularly hazardous, and the Committee is therefore of the opinion that 8 per cent on the average tangible assets would be a fair return. This would absorb 46x dollars of the average yearly earnings of 112x dollars, leaving 66x dollars as the return upon the intangible assets.

Since it is shown above that the intangibles brought 590x dollars, it is apparant that they were sold on the basis of a prospective return judged by previous experience of a fraction over 11 per cent. Since the intangibles were actually sold in 1916 on this basis, the committee is of the opinion that it is only fair to apply the same percentage in ascertaining the value of the same intangibles three years previously. The average earnings of the corporation, covering approximately the five-year period immediately previous to March 1, 1913, were 30x dollars. During the same period the average tangible assets employed were 258x dollars. An 8 per cent return on the average tangible assets of 258x dollars required 20x dollars of this amount, leaving 10x dollars as the earnings attributable to good will at that time, which capitalized upon the same basis of 11.13 per cent, gives a value of 92x dollars as the value of the good will on March 1, 1913.

GENERAL METHOD OF TREASURY.—Allowing for extreme situations and the great flexibility of the income tax law, the general method of valuing good-will used by the Treasury is to allow a return of 10% (more or less according to the risk involved in the business) out of average earnings for the 5-year period preceding date as of which value of good-will is to be ascertained. The 10% is reckoned on average tangible assets for the 5-year period. Any surplus earnings over the 10% represents return on intangible assets. This is capitalized on basis of 5 years' (more or less according to the risk involved in the business) purchase.

SPECIAL POINTS IN GOOD-WILL VALUATION.—The following is adapted from a discussion by N. J. Lenhart. It covers many points in good-will valuation with special reference to federal taxation:

Good-will is an intangible and fluctuating asset representing value of a business over and above money, other tangibles and accumulated profits invested in it.

In actual sales and purchases the value has been computed in a variety of ways, as: (1) Aggregate of entire earnings of a specified period; (2) a certain number (of years' purchase) times average earnings in excess of a determined rate on average tangible investment for several years; and (3) capitalization of an average of several years' earnings at a specified rate, deducting therefrom the value of tangible assets. In a number of cases the amount paid for good-will represents only the difference between book value and sales price, which price is the result of a compromise between bid and asked prices with little or no regard to any of the above-mentioned methods of computation.

Good-will has value as a rule only when a business has earned and it is expected will continue to earn a rate on invested value of tangible assets in excess of a certain basic rate of return. The exception to the rule would be, for example, when a large amount of advertising has been done but sufficient time has not elapsed to show its value. Excess of earnings arises from a number of factors, as patents, reputation for integrity, trade names, publicity from past advertising, location, and a partial or complete monopoly.

In general, investors in bonds, preferred stocks or common stock place considerable importance on past earnings, reputation and good-will factors (although perhaps not to the same degree), because no investor is willing to invest in a business which he does not believe is reasonably assured of continued success.

The rate of return (earnings to investment) that will attract investments in common stock in any particular industry cannot be reduced to a definite figure. The factors affecting the yield expected are:

1. A seasoned stock with a long-continued earning and dividend record sells at a lower yield than an unseasoned stock.
2. A business with stable earnings sells at a lower yield than a business in the same industry with unstable earnings.
3. A steady growth in earnings always attracts investors at a lower yield than an unsteady growth or no growth.
4. The liberality of the dividend distribution, marketability, and sectional money rates have considerable effect on yield expected.

There is no general rate of return necessary to attract investors in any particular industry.

If any particular business is in question and a rate of return which will attract an investor is agreed upon, the question arises as to whether the investor desires the agreed return upon his whole investment or whether he desires the agreed rate on investment in tangible assets and a higher rate on investment in good-will.

One method of computation often used is to decide on rate of earnings necessary to attract investors, which may be 9%, for example, and then to take, say, five times excess of earnings over 9% on the investment during a specified period. Under this method resulting rate of earnings on new investment figure is always larger than the rate represented by 9%, provided, as is nearly always the case, the number of years used is less than 100 divided by rate used. It might be concluded that the invester requires a higher rate of return on amount invested in good-will than on balance of his investment.

This is not generally the case because:

1. In many instances businesses are purchased in which good-will is the bulk of the asset bought. This is particularly true when good-will consists largely of patents, or in case of retail stores where location is particularly favorable.

2. The purchaser expects to continue the business and further develop the good-will. The elements of good-will, such as location, patents, and trade-names, are no more likely to depreciate than are physical assets through misuse, obsolescence, and poor management.

The Treasury Department has consistently refused to allow depreciation on good-will purchased, assuming good-will to be of a more permanent nature than physical assets.

It is consequently reasonable to assume that a rate of return which will attract investors is a rate on their entire investment, including good-will.

In view of the foregoing discussion there are two methods of computing good-will as at Mar. 1, 1913, which seem desirable in two situations, namely: (1) When the business is sold and a price paid for the good-will, and (2) when there has been no sale and the value at which good-will is paid in for stock is to be determined, or when the good-will of liquor interests has been lost through enactments by Congress.

The procedure to be used in the first instance is best shown by an illustration of an actual case. The facts are:

Income in 1910	$ 150,000.00	Investment for 1910	$ 750,000.00
Income in 1911	160,000.00	Investment for 1911	800,000.00
Income in 1912	170,000.00	Investment for 1912	850,000.00
Total	$ 480,000.00		$2,400,000.00
Average	$ 160,000.00		$ 800,000.00

Per cent of return 20%

Income in 1917	$ 425,000.00	Investment for 1917	$2,000,000.00
Income in 1918	375,000.00	Investment for 1918	2,400,000.00
Income in 1919	322,000,00	Investment for 1919	2,800,000.00
Total	$1,122,000.00		$7,200,000.00
Average	$ 374,000.00		$2,400,000.00

Per cent of return 15.5%

The amount actually paid for good-will early in 1920 was $1,000,000, which, added to the average investment, $2,400,000, gives a new average of $3,400,000. Earnings for 1917, 1918, and 1919 were 11% on the $3,400,000. It is evident that the investor expects to get not more than 11% without further development of the business.

Earnings decreased during 1917, 1918, and 1919, but increased in pre-war years. Conditions were stable in 1910, 1911, 1912, whereas 1917, 1918, and 1919 were wartime years and a period of depression could be expected. Since, when conditions are stable and earnings show a steady increase, the risk is considered less and the expected yield is lower than when the reverse is true, it follows that in 1913 an investor or the same investor would undoubtedly have been satisfied with considerably less than 11% and certainly not more than 10%. On the basis of $160,000 average earnings in pre-war years and an expected return of 10%, the business was worth at least $1,600,000 at Mar. 1, 1913, and good-will was then worth $800,000. Due to nature of the business, patents, location, reputation, etc., earnings could be expected to continue for a minimum of 7 years and probably longer without additional development. Seven times average earnings over 10% in pre-war years shows a good-will of $560,000, which is obviously low (this is demonstrated in the actual case just cited), and this method admits of more argument than the one used in the illustration. If there are factors which make the pre-war period entirely different from the years preceding date of sale, this method based on actual sales price as illustrated above may be open to criticism, but as a rule it seems to be the fairest and least open to attack if there has been an actual sale of good-will.

If there has been no sale of good-will a more or less arbitrary method must be adopted. Any method used is open to discussion. It is of highest importance to get as many comparatively definite factors as possible.

In pre-war years the great majority of industries earned less than 10% upon invested capital. It follows that in most industries the rate which could be expected by investors willing to pay an amount equal to or greater than invested value of tangible assets was less than 10%. Variations in rates expected by an investor between industries as a whole depend upon risk involved. This risk varies directly with number of years the profits of the industry can be expected to continue according to character of the business.

The **preferred stock rate** expected in an industry varies much less between the various businesses in the industry than does the common stock rate. The preferred stock rate is, therefore, much easier to obtain and less open to question.

If expected rate of return on investment in a business were known, it would be easy to capitalize average earnings at that rate and call the difference between book value of net tangible assets and the figure so found good-will. But this rate is unknown and could not be satisfactorily agreed upon. However, since expected rate varies directly with risk, the rate would seem to be about the rate of average earnings to an investment figure made up of book value plus a number of years times average excess of earnings over the preferred stock rate. The number of years is determined according to the risk.

This method is used as follows:

Income in 1910	$150,000.00	Investment for 1910	$ 750,000.00
Income in 1911	160,000.00	Investment for 1911	800,000.00
Income in 1912	170,000.00	Investment for 1912	850,000.00
Total	$480,000.00		$2,400,000.00
Average	$160,000.00		$ 800,000.00

Preferred stock rate was about 6% during 1912:

6% on average investment	$ 48,000.00
Average earnings	160,000.00
Excess over 6%	$ 112,000.00
Seven times excess over 6%	$ 784,000.00

The good-will, as computed above, amounts to $784,000 as compared with $800,000 under the method previously discussed.

The **preferred stock rate** should be the rate in the industry in the locality of the particular business. This rate can be found with some degree of accuracy, at least with much greater accuracy than the rate necessary to attract investors to purchase common stock. The rate should be the average over a period of not more than a few years prior to date at which good-will is to be computed.

If a standard line of industry is decided upon and number of years' purchase to be used in that industry is agreed upon, relative degree of risk and number of years to be used in some other industry should result in no wide divergence of opinion. Number of years to be used in finding average return on investment need not be the same as number of years' purchase used, since cognizance must be taken of any special features present and facts which make certain years abnormal.

A set formula cannot be developed for computing good-will. Each case should be considered on its merits. If there has been a sale of good-will, the first-mentioned illustration or an adaptation of it gives the most accurate result.

If there has been no sale, some variation of the second illustration should be used.

Matter of Flurscheim[10] involves valuation of good-will in a transfer tax appraisal. The interest of Herman Flurscheim, equal partner with Franklin Simon in Franklin Simon & Co., after death of former in 1914, was appraised at $900,000, one-third of which was good-will. In remitting this report for revision, the Surrogate said: "Franklin Simon & Co. was established in the year 1903 with a combined capital of $110,000. Three elements must be considered in ascertaining good-will, viz., net profits, capital, and the number of years' purchase." Also:

The transfer tax appraiser has applied a multiple of three years to the sum ascertained by deducting from the net profits as found by him 6% interest on the capital and $100,000 —representing the value of the services of the decedent and the surviving partner, to which latter item no objection is made and the amount appears to the court reasonable and proper. The sole reason assigned by the accountant and adopted by the transfer tax appraiser for not applying a larger multiple is because the firm was in existence at the death of the decedent only 12½ years. I do not think that this is a controlling factor. The record shows that the sales have increased steadily since the establishment of the copartnership. The sales for the 3 complete fiscal years preceding decedent's death were respectively $3,986,859, $5,003,364, and $5,919,925. In the year prior to the death of decedent $219,852.82 was the sum spent for advertising. The firm is extremely well and favorably known. It has succeeded in establishing a reputation in the community which might not be gained by other concerns in business many years longer. Under all the circumstances I think a 5 years' purchase should be applied in fixing the good-will.

The deceased's interest in the copartnership was ascertained by computing average net annual profits for the 3 complete fiscal years preceding his death. From this was deducted 6% on average annual net tangible capital and surplus employed for the same period, and a total of $100,000 as the annual value of the services of the two partners. The difference multiplied by 5, or about $1,200,000, was held to be the amount of good-will.

The method of valuing good-will approved by the New York courts is as follows:

---

[10] 107 Misc. 470.

1. From average net profits for several years preceding deduct 6% on average net capital employed for same period.
2. Allow a reasonable deduction for services of the owners if they have not received adequate compensation for services.
3. Additional allowance should be made for deceased partner's services if they have been of special value to the enterprise.
4. Multiply the difference by a number of years' purchase, this usually varying from 2 to 6.
5. The court determines the number of years' purchase as a question of fact. In doing so it considers character of business, time it has existed, amount spent on advertising, and its reputation.

In Massachusetts the courts have not adopted a formula but give consideration to any factors which seem to bear weight.

OBSOLESCENCE OF GOOD-WILL.—Obsolescence of good-will occurs when sale of a commodity is curtailed or destroyed by adverse legislation. **Good-will of brewers** was made obsolete by the prohibition law. In such cases it is necessary to ascertain amount of good-will value destroyed. It is customary for liquor dealers to put out under popular brands only as much goods as can be readily marketed without affecting established price. Other goods of same manufacture are sold under other brands or under no brand at figures much below those asked for the well-known brands. The difference between the price at which a commodity is sold under a given brand and that at which it is sold under no brand name, multiplied by number of units sold during a given year, is amount of profit attributable to that brand during that year. If this practice is continued long enough to show that results are fairly constant and regular and may be expected to yield about the same profit each year, value of the brand may be determined by capitalizing this earning at, say, 20%.

The **principles of valuation** applicable in case of obsolescence of good-will are, in general, same as those applicable under other circumstances. **Hazards of the business** under consideration must be considered in determining at what rate to capitalize excess earnings. The Treasury in valuing good-will of brewers, allows out of average earnings over a period of years prior to Mar. 1, 1913, preferably not less than 5 years, a return of 10% upon the average tangible assets for the period. Surplus earnings above this represent return on intangibles. This the Treasury capitalizes upon basis of not more than 5 years' purchase, i.e., five times the amount available as return from intangibles is value of intangibles.[11]

In a specific case the Bureau of Internal Revenue determined the value of intangible assets by first making an appraisal of the tangible assets at about the time they were sold by owner, Nov., 1919. Five years' earnings prior to time of sale, i.e., for the years 1915-1919, inclusive, were averaged and a rate of 8% on value of tangible assets as appraised was taken as a fair return thereon. Balance of income above this was divided by difference between selling price of business and appraised value of tangible assets. This gave a percentage of 11.33, which was the return on good-will. This ratio of 11.33 was then applied to average earnings for 5 years prior to 1913 to secure good-will figure as of Mar. 1, 1913. In arriving at net income for purposes of determining value of good-will, income taxes assessed during 1915-1919 were not deducted from gross income, because the valuation is supposedly the same as it would have been had it been made on Mar. 1, 1913. At that

[11] Cumulative Bulletin No. 2, p. 31.

time the taxpayer could not have foreseen what taxes would be imposed. The period, 1915–1919, was hardly a typical one because rates of income were higher than usual during much of that time.

ROUTINE TREATMENT—WRITING DOWN.—Some authorities claim that good-will is subject to **depreciation**; others claim that it is not. Ordinarily it is better to regard it as not being subject to depreciation.

There remains the question of desirability of writing it down. The chairman of Messrs. Schweppes, an English concern, stated, in 1922, that the good-will of his company had, since 1918, been written down from £1,039,309 to £820,000, but considered even that figure subject to criticism and added that the directors would continue the drastic writing down of this asset out of profits.

Value of good-will depends on profits earned and upon probability of their continuance. If a concern writes down good-will, the amount set aside is an appropriation of profit or surplus, not a charge against income. When profits are sufficient to provide directors with surplus sufficient to write down good-will, that in itself is evidence that good-will has not decreased in amount; it may, in reality, have increased. On the other hand, if profits have decreased, there is not likely to be any surplus which can be used to write down good-will.

In *Wilmer* v. *McNamara* (1895), an English case, it was held that a company is under no legal obligation to write down its good-will whether or not salable value has been reduced. Unless a company has special reasons for doing otherwise, it is usually preferable to employ surplus for writing down good-will.

It makes no essential difference whether a concern carries its surplus profits to a surplus reserve account, allowing good-will to stand at cost, or uses it to write down good-will. If good-will is permitted to stand at cost on the balance sheet while surplus profits are accumulated in a surplus account, there remains the temptation of using this surplus to declare dividends, which would not be the case were surplus used to write down good-will.

There exists no **legal obligation** to write down good-will out of profits subsequently earned; consequently such profits may be used to pay dividends. But this is not sound procedure from an accounting point of view, and if it appears that value of purchased good-will is diminishing, steps should be taken to write off a reasonable amount of it.

Fluctuating character of super-profits makes difficult putting into operation of any definite scheme for writing down good-will. This does not mean that reasonable means should not be adopted for such writing down.

ROUTINE TREATMENT—SINKING FUND METHOD.—This consists of setting aside equal annual instalments to accumulate, at compound interest, in a given time to the amount which has been expended in buying good-will. Given a definite period of years over which to write off good-will, effect is the same by the sinking fund method as by writing it off directly. The apparently smaller contribution required to the sinking fund is accounted for by the fact that the sinking fund grows not merely by the annual instalments but also by the accretions of interest. When good-will is written off by direct annual charges to Surplus, the cost is the same one year as another. When the sinking fund method is followed, the cost increases each year. Thus if the sinking fund accumulates at 4% to $100,000 over a period of 20 years, the first instalment is $3,358 plus no interest, whereas the last instalment is $3,358 plus $3,717 interest, a total of $7,075. It is an error to omit calculation of the growing annual interest cost from the records. The chief objection

to the sinking fund method is that there is no security that it will ultimately be used for the purpose intended. It may thus create a false sense of financial security.

Special Problems

PURCHASE AND MERGER.—When one concern purchases an interest in another, good-will is brought in to represent excess earning power of purchased concern. An alternative procedure is suggested in the *Accountant* for June 3, 1922 (p. 784), as follows:

As good-will represents the capitalized value of the company's earning powers it might, therefore, be preferable for new companies to issue their ordinary shares at a premium representing the purchase price of the good-will, thus avoiding the necessity for showing any good-will value in the Balance Sheet; then, if profits did not reach the standard expected, the good-will would be automatically eliminated by the corresponding fall in the market price of the shares.

When companies buy out small traders who have given personal attention to the management of affairs, they frequently pay for good-will more than conditions warrant. The small owner earned a profit which recompensed him not only for his investment but also for his time and personal exertions. Stockholders do not make the same personal exertion and so cannot expect to secure the same profits. This circumstance frequently leads to over-capitalization of companies through their anticipation of a continuance of the profits of the small absorbed enterprises, but whose earning capacity under changed conditions does not fulfil expectations. If old owner continues with the concern as manager the situation is more favorable, but then earnings on capital ordinarily are decreased because of increased investment necessary to make it possible to capitalize good-will.

Ordinarily the **amount to be paid for good-will** is determined in the agreement of sale entered into between purchasing company and vendor. If the agreement does not specifically mention good-will, it may be inferred that it does not exist unless purchase price is in excess of assets taken over. Also, such assets may be representative of other intangible assets—as, patents, trade-marks, copyrights, etc. Sometimes good-will is regarded as one asset in combination with these other items which may be essential to its existence.

To have a **sales value** good-will must represent a substantial excess of earning power over a fair return on the investment plus a reasonable allowance for managerial salaries. Merely because a business is well established does not mean that it has good-will for which a buyer can afford to pay a large sum. If, under any conditions earnings are not largely in excess of interest on capital plus managerial salaries, it is improbable that a new management can increase them greatly. **Mere sentiment** attached to an old but losing business is not good-will. Frequently lack of earning power is ascribed to bad management, but this plea is overworked. Profits should be increasing. In case of a business which is standing still the danger of retrogression is great.

RELATION OF COMMON STOCK TO GOOD-WILL.—When good-will represents an important item in capitalization of mergers and consolidations, it is usual to make it the basis for an issue of common stock. Preferred stock is issued to amount of physical assets and from total net earnings is deducted the sum required to pay dividends on this preferred stock. Remainder of net earnings is then capitalized to find amount of good-will and therefore amount of common stock to be issued.

To illustrate, assume case of a concern having net earnings of $4,000,000

a year. Its physical property is valued at $21,000,000 and preferred stock is issued to that amount. A 6% dividend is to be paid. This amounts to $1,260,000, which deducted from net earnings of $4,000,000 leaves $2,740,000 of yearly profits due to good-will. Now, if common stock dividend rate is to be 8%, good-will valuation will be 2,740,000 ÷ .08 = $34,250,000, which, for sake of round numbers, might be placed at $35,000,000. At organization of the U. S. Steel Corp. preferred stock and bonds were issued to cover tangible assets and common stock was issued to represent good-will, its amount being such that had profits been maintained it would have received a dividend of 7½%. So little confidence existed in the ability of the Steel Corp. to succeed that at one time a share of its common, par $100, could be bought for $8. Yet it later sold for more than 136. On July 11, 1922, it was quoted near par.

Sears, Roebuck & Co. was capitalized on a similar basis. At time of organization in 1906 its material assets were valued roundly at $10,000,000. The preceding year profits were $2,868,061.31. Preferred stock was issued to amount of $10,000,000 and was assigned a 7% cumulative dividend, necessitating $700,000 yearly. This left $2,168,061.31 upon which to base good-will valuation. Common stock was placed at $30,000,000 and was therefore capitalized at between 7% and 8%.

Recently the requirements of the **excess profits tax law** to the effect that no valuation of intangible assets in excess of 25% of total par value of a corporation's stock shall be recognized, has interfered with this plan of capitalization. When, in 1919, the Endicott-Johnson Co. was organized, the good-will was valued, not on basis of producing power, but arbitrarily in order to comply with provisions of the tax law. The capital stock amounted to $29,000,000; $7,000,000 of this was based on good-will. It was stated that had good-will been based on earnings or a lump sum valuation, it would have been placed at a much higher figure.

PARTNERSHIP ACCOUNTING.—Good-will is introduced into partnership accounting for one of the following reasons:

1. Purchase of the good-will of the business.
2. Purchase of some additional business by the partnership.
3. Sale of a part of the business of the partnership.
4. Admission of a new partner.
5. Retirement or death of a partner.

When, because of one of these circumstances, good-will is brought upon the books **for purposes of adjustment,** it is customary either to eliminate it from the accounts or to credit or debit it to the partners' Capital accounts according to agreement.

When good-will is to be eliminated from the accounts, it should, in absence of contrary agreement, be carried to the Capital accounts in profit and loss-sharing ratio. Thus, if partners M and N share profits in proportions of 3 parts to M and 1 part to N and X pays $5,000 for a ¼th share in future profits and brings an additional $10,000 into the business as his invested capital, the latter will be brought into the books by means of a charge to cash and a credit to X's Capital account. The $5,000 paid for a ¼th share in future profits of the business may be handled in different ways. M and N are entitled to it in proportions of ¾ to M and ¼ to N, because in the future their profits will be less by those amounts, respectively. M is entitled to ¾ of $5,000, or $3,750; and N is entitled to ¼ of $5,000, or $1,250. There are various ways of affecting the desired result. M and N may receive their

shares directly from X and no entry need be made on the books. If, however, it is desired to bring the amount into the business because it is thought that this additional capital will be required because of developments, M and N may credit their Capital accounts with the proper proportions.

Another plan is for M and N to place a valuation upon good-will of, say, \$20,000, enter it among the assets at that amount, and increase their capital accounts, respectively, \$7,500 and \$2,500. X is then allowed to bring in his \$15,000 as his investment, his Capital account being credited with that amount, on condition that the \$20,000 good-will be regarded as an asset of the business. If in the future this good-will is eliminated, X will be charged with ¼ of the total, or \$5,000, leaving his Capital account at \$10,000, the same as where, by the other method, good-will is not brought into the books.

DISSOLUTION OF PARTNERSHIP.—Provision for handling good-will in case of dissolution of a partnership resulting from bankruptcy, death or retirement of a partner, should appear in the articles of agreement. It should cover two points: (1) method of valuation, and (2) method of settlement.

Sometimes a **specific provision** occurs, that no allowance shall be made for good-will. Sometimes a **fixed sum** is stated as its agreed value for purposes of adjustment of partners' interest. Usually it is better to take good-will at an **agreed number of years' purchase of yearly profits,** such yearly profits to be determined by averaging the profits of 2 or more years immediately preceding the one in which dissolution occurs. Usually it is agreed that payment of the share of the deceased or retiring partner shall be in instalments, which are spread over a period of 1, 2, or 3 years, interest being allowed an agreed rate on unpaid portion. If a partner retires under an agreement that good-will shall remain the property of the partners who continue the business, he is subject to same restrictions as is the vendor of a business. See "Status of Vendor and Vendee," p. 589.

ADMISSION OF PARTNERS.—If a partnership has an **established business** it is usually necessary to consider good-will when a new partner is admitted, to give due credit for efforts of old partners in building up the business. Unless there is agreement to the contrary, when a new partner is admitted his contribution entitles him to share equally with the other partners in profits no matter what the amount of his investment may be.

Suppose A and B are partners and the following balance sheet shows their financial status:

Cash	\$ 5,000	A, Capital	\$17,500
Other Assets	30,000	B, Capital	17,500
	\$35,000		\$35,000

It is agreed to admit C to the partnership, he to receive ⅓rd interest on condition that he invest \$20,000. It is necessary either to:

1. Bring good-will into books according to some agreed plan, or,
2. Make an adjustment among the Capital accounts without bringing in good-will.

If it is decided to bring in good-will, this is done through following journal entry:

Good-Will	\$5,000	
A, Capital		\$2,500
B, Capital		2,500

This increases Capital accounts of A and B to $20,000, respectively, and when C contributes his share, Capital accounts of the three partners will stand at same amount. But if decided to make an adjustment among partners' Capital accounts, this may be done as follows:

C, Capital	$2,500	
A, Capital		$1,250
B, Capital		1,250

The following illustrates some problems arising in partnership adjustments for good-will.

A and B form a partnership, but before they have gone far enough with developments to demonstrate their success, C becomes interested. He offers to put in capital equal to each of theirs for a ⅓rd interest. A and B, however, demand a 10% bonus to be divided between the two of them. In agreeing to pay this, C is not buying good-will, but is speculating.

If, now, the firm operates for a long enough time to establish the fact that it has a stable earning power well above normal and D desires to become a partner, the old partners will require him to pay not only for book value of a ¼th interest, but also an amount equal to ¼th of the capitalized excess earnings, by bringing good-will upon books and crediting their Capital accounts with their respective shares therein. The total contribution from D will bring his Capital account up to an equality with accounts of A, B, and C. In this case D is not speculating but is paying for good-will. Should A, B, and C require D to pay more than the amount justified by excess earnings, as shown by past experience, because of anticipated increase of profits in future, this payment would not be for good-will, but for speculation. If it is desired to bring the full amount on books only, the true amount of good-will should be charged to Good-Will account, while amount paid in excess thereof should be charged to a "Bonus to Old Partners" account, and should be written off as soon as practicable.

PARTNERSHIP INCORPORATED.—When a partnership is to be incorporated and the old partners are to become sole stockholders in new company, the necessity of bringing in good-will is not apparent, because each would secure his proportionate interest and his due proportion of profits. In such a close corporation capitalization is not a matter of importance; in fact it is frequently fixed at an amount which is purely arbitrary. When, however, there is a likelihood of changing membership, the question of capitalization becomes of importance; it may be laid down as a general rule that if stock is sold at any time, an undercapitalization will be found disadvantageous. For this reason, when a firm is incorporated, good-will should be valued as carefully as any other asset.

GOOD-WILL BASED ON TRADE-NAMES.—An essential difference exists between good-will of a concern which sells a **staple product** which is bought and sold under its staple name but without reference to the producer, and good-will of a concern which sells an article under a **trade-name** and which is always traded in with a knowledge of the producer or of the brand. The former kind of article is usually advertised under its trade-name, and if the market is an expanding one, it gives rise to a form of good-will of which the owner cannot be easily deprived. Good-will which is built up on trade-names may, however, be suddenly lost if the article becomes unpopular for some reason. The **tobacco business** affords an illustration of good-will built up on trade brands. Most forms of manufactured tobaccos are sold under **special brand names.** Extraordinary profits have resulted from the

popularity which some of these brands have acquired. Such popularity must be based upon actual valuable qualities possessed by the goods. Brands of manufactured tobaccos are in this respect like many so-called proprietary articles—patent medicines, perfumes, liquors, toilet preparations, and chewing gums.

RELATION TO INVENTORY TURNOVER.—Inventory turnover is measure of rapidity with which working capital is reinvested in stock-in-trade. Since any increase in **rate of turnover** results in a higher rate of profit on invested capital, and since good-will is determined by excess of net profit over a fair return on investment, it follows that there exists a close relationship between good-will and turnover. Creation of good-will through **advertising** and by giving **prompt and efficient service** is one of the best ways of increasing turnover.

RELATION TO PATENTS.—From an economic point of view, patents, especially when found in groups, are closely analogous to good-will. **Value of patents** varies directly with their earning power. Although patents possess a definite legal life, this is more or less of a fiction because this life is generally extended by making improvements on the original. As a consequence, in a going business the value of patents becomes a form of good-will closely connected with the trade-name. For this reason the Bureau of Internal Revenue, while permitting taxpayers to depreciate patents on basis of a normal life of 17 years, does not require it, but leaves it optional with the taxpayer.

ACCOUNTING PROCEDURE.—Good-will should appear on the **balance sheet** as a separate item and at cost, unless found advisable to write it down in accordance with well-defined policy. Since good-will takes recorded form not as it is created, but only as a result of a contract necessitating the determination of its value, it is probable that bulk of value existing in form of good-will is not recorded. Only in case of sale should it show a profit; it must not be arbitrarily written up in order to show a profit. Tendency of actual value of good-will to fluctuate constantly is sufficient reason why no changes should be made in the account except in case of sale or in case it is thought desirable to write it off against surplus. Occasionally good-will is written up, surplus increased to correspond, and a stock dividend paid. Good-will is not subject to the ordinary influences which cause tangible assets to depreciate, i.e., it is not affected by wear and tear, obsolescence and inadequacy; hence it should not be cared for as these depreciating assets are. Writing off good-will may give rise to a **secret reserve.**

Ordinarily the figure at which good-will is carried on the balance sheet is of little significance to an intending purchaser, because he makes his own estimate of it on the basis of past profits.

Good-will should not be written up and credited to profits, because there results a swelling of profits which is not realized and which is subject to shrinkage. The increase in value of good-will is the result of profits already taken into account, so that addition of the increased value of good-will to profits results in doubling actual gains and thus may lead to dividend payments not justified by circumstances.

There are exceptional cases in which it is permissible to write down good-will for **depreciation** or **obsolescence.** The Bureau of Internal Revenue permits a deduction for income tax purposes in case of discontinuance of a going business because of exhaustion of source of supply, providing cost of good-will or its value as of Mar. 1, 1913, if acquired before that date, can be

shown definitely and the period of obsolescence determined with reasonable accuracy. To sustain a claim for such a deduction for obsolescence it must be shown that good-will will be valueless at the close of a period which can be ascertained with reasonable accuracy. The good-will must also be assignable as distinguished from good-will which attaches to individuals or to premises. No allowance will be made if the good-will is of value in another business.

BALANCE SHEETS FOR CREDIT PURPOSES.—If a balance sheet is to be used for credit purposes, it does not ordinarily matter whether good-will is allowed to stand at cost or is written off against surplus. Writing off good-will has no effect on the financial standing of a company, because bankers and other creditors judge financial strength by comparing tangible assets with liabilities. They are interested chiefly in the relation of quick assets to quick liabilities. They place no reliance on good-will, because it is intangible and vanishes when the concern becomes unprosperous, which is exactly when the creditor requires protection.

SPECULATION vs. GOOD-WILL.—When a business is purchased at more than net book value, the excess paid represents either purchase of good-will, which is based on established earning capacity, or a speculation in the form of a purchase of what is believed to be discounted value of future profits. See "Good-Will in Admission of Partners."

INSURANCE AND GOOD-WILL.—When the good-will of an enterprise is dependent largely upon efforts and personality of one man, a convenient method of securing protection against sudden loss of that good-will from death is to insure the life of the individual concerned. An insurable interest exists here. The president and guiding spirit of a corporation dies. The company has insured his life for $50,000, and so does not feel ill effects from his death. A dry goods concern is started by three young men. The life of each is insured for $12,000. Shortly after beginning operations one partner dies. The insurance makes possible a quick settlement and the business is continued without interruption.

APPRECIATION OF GOOD-WILL.—There may be justification for reappraising tangible assets; there is none for the writing up of good-will, except sale or some other contract involving the determination of its value. When a concern arbitrarily writes up good-will, credits Surplus, and pays a dividend to stockholders, it defrauds them. If a stockholder receives such a dividend with notice to that effect, he should regard it not as income but as a distribution of capital. Under such circumstances it is reasonable to assume that true surplus has been exhausted. See "Accounting Procedure," p. 585.

Going Concern Value

DEFINITION.—The expression **going concern value** is employed in place of **good-will** in connection with valuation of public utilities. Justice Moody, of the United States Supreme Court, in *Knoxville Water Co. Case*, defines going concern value as follows: "This sum we understand to be an expression of the added value of the plant as a whole over the sum of the values of its component parts, which is attached to it because it is in active and successful operation and earning a return."

Wm. H. Bryan's definition: "It is the value such a plant has over and above its physical value, due to the fact that it is not a bare and idle system, but it is in actual operation, doing business with large numbers of connected customers. It is something like the good-will of a business but is even more tangible."

Various methods have been employed to **estimate going concern value.** Frequently English syndicates, when buying property in the United States, have valued this item as the equivalent of the net income of a given number of years, or, in other words, as a given number of years' purchase price. But when the utility possesses a **monopoly,** the majority of court decisions are against allowing anything for going concern value. In other cases it is customary to allow for a reasonable expenditure of money in getting the business of an undertaking established. This item was first officially recognized by Justice Brewer in 1894, in the *Kansas City Waterworks Case.*[12] He said: "The city steps into possession of a property which not only has the ability to earn, but is, in fact, earning. It should pay, therefore, not merely the value of a system which might be made to earn, but that of a system which does earn."

One method of determining going concern value is to base it on net earnings. But it must be remembered that courts are not inclined to favor property valuations arrived at by this method. It was followed by the Wisconsin Commission, in *Hill* v. *Antigo Water Co.*,[13] and in *State Journal Printing Co. et al.* v. *Madison Gas & Electric Co.*[14] The method followed is illustrated by results secured in case of the electric light plant in Madison. Cost of electric plant at time of acquisition was first determined as closely as possible. To this was added cost of all new extensions, increases in value of land, depreciation, and interest and profit calculated on original cost at rate of 8%. From the total thus secured net earnings of the year were deducted. The balance indicated value of plant at end of year. This amount was then carried forward and became "earning value" as of Jan. 1 of following year. To this amount same items as shown above were again added. In this way the value was determined for each year and used as starting point in year following. The last value determined, in this case for year ended Dec. 31, 1908, was taken as earning value of plant. Depreciation, it should be noted, is added to value instead of being subtracted from income. By either method the result is the same, but the Commission calculated on setting up a depreciation account to which a certain sum should be added out of surplus each year. Moreover, computing interest and profit at rate of 8% and adding this amount and depreciation to general cost, resulted in carrying forward to next year any balance of depreciation, interest, and profit which was not covered by the year's net earnings, and which was to be paid during later prosperous years in the life of the plant. The computations are shown in the following table.

RELATION OF GOING CONCERN VALUE TO PHYSICAL PLANT.— Physical plant is the basis of all value. For this reason it is usually maintained that going concern value does not depend wholly upon earning capacity as a thing apart from physical property. Earning capacity depends on rates, and rates depend on fair value of physical property. Without substantial physical property, earning capacity and going concern value cannot exist.

Miscellaneous

STATUS OF VENDOR AND VENDEE.—The **purchaser of good-will** of a business acquires the right to represent himself as the successor to the business in question. Ordinarily, too, he can use the trade-name of the business, but not in such a way as to render the **vendor** liable for debts incurred in such trade-name. On the other hand, the vendor cannot continue to trade in his own name if he carried on the business in that name and if it can be shown that it would deceive the public into believing that he continues to be the owner of the business or if it would be impossible to trade without thus deceiving the public. Neither can the vendor set up a business under any name which might cause the public to infer that he is still conducting his old business. Nor can he circularize his old customers and thus injure the value of the good-will which he has sold. The vendor may, however, set up a new business. He may trade in the same line of business, and wherever he chooses, if there is no special understanding to the contrary. He may do whatever a stranger might in the ordinary course of business do, even to the extent of interfering with the custom of the vendee; but he cannot avail himself of his special knowledge of old customers to regain them, without consideration, because he parted with them for value. "He must not make his approaches from the vantage ground of his former position, moving under cover of a connection which is no longer his."

In so far as possible the vendee should protect himself by entering into an agreement with the vendor to the effect that, except under prescribed conditions, vendor shall not compete against the business which he sells. By doing this it is possible to lay down the conditions required by the particular business in question and to meet the requirements of the peculiar circumstances which affect it. The more restrictive the agreement of sale, the more valuable it is to the vendee and the less likelihood there is that the vendor can derive any future benefit from it. Such an agreement must not, however, be in unreasonable restraint of trade.

To make the restraint reasonable it must be for a valuable consideration and it must be only partial.

SEIZURE UNDER COMPULSORY POWERS.—When one must vacate his premises because the land has been seized under right of eminent domain, he should be compensated for loss of good-will resulting from evacuation of the premises, as well as for loss resulting from material damages. In such cases the good-will is not transferred but remains the property of the trader. The good-will may not be greatly affected, as where orders are received from a wide area, and especially if convenient quarters can be secured nearby. But if the business is retail and strictly local in character, the necessity of removal to distant quarters may mean the destruction of a great part of the good-will.

ACTUAL GOOD-WILL VALUATIONS.—The figures at which large American corporations have placed their good-will in recent years are shown below:

B. F. Goodrich Co.	*$57,798,000.00
American Tobacco Co.	54,099,430.00
P. Lorillard Co. (trade-marks, brands, etc.)	21,137,927.00
Liggett & Myers Tobacco Co. (trade-marks, brands, etc.)	40,709,711.00
Republic Motor Truck Co.	4,805,936.00

* Omitted from balance sheet after 1919.

Pyrene Manufacturing Co. (patents, trade-marks, and good-will)	1,002,450.00
W. S. Light & Heat Co. (patents and good-will)	4,608,256.40
Cluett Peabody (good-will and trade-names)	18,275,000.00
F. W. Woolworth Co.	30,000,000.00
Butterick Co. (patents, good-will, copyrights, trade-marks, etc.)	13,893,271.00
Silver-Burdett & Co. (publishing rights, contracts, copyrights, etc.)	1,024,820.00
Hendee Manufacturing Co.	6,157,646.00
American Chicle Co. (good-will, trade-marks, etc.)	18,826,642.00

Sometimes valuations are assigned to good-will although it has not been brought into the balance sheet as an asset. Recently the advertising manager of the California Fruit Growers' Exchange estimated the value of the Sunkist trade-mark at $1,000,000, but the president of the exchange thought that it would be nearer $10,000,000. The value of the name *Bull Durham* has been estimated at between $10,000,000 and $20,000,000, and it is said that $10,000,000 has been offered for the *Camel* cigarette good-will. It is a familiar saying that such trade-marks as *Ivory Soap, Victrola, Kodak,* and *Uneeda* are worth a million dollars a letter.

In Sept., 1914, an appraisal was made of the estate of Joseph Pulitzer, former proprietor of the *New York World* and *St. Louis Post-Despatch*. The earning power of each was first estimated on the basis of average yearly earnings for 4 years preceding Mr. Pulitzer's death; but from this average a considerable amount was deducted to allow for certain favorable contracts for the purchase of white print paper which were soon to expire. A deduction of $100,000 was also made to allow for services of Mr. Pulitzer; also 6% was deducted on actual capital invested. Average net earnings left amounted to $196,411 for the *St. Louis Post-Despatch*, and $81,180 for the *New York World*. The appraiser capitalized these amounts on a 10% basis, resulting in a good-will valuation of $1,964,110 for the former paper and $811,800 for the latter.

There is a tendency among some companies to dispense with good-will altogether, because it is sometimes viewed with suspicion. The General Electric Co. has written its good-will down to $1, and the Victor Talking Machine Co. to $2. The tendency to treat good-will in this way was checked by the excess profits tax, but with the repeal of this a return to this policy may be expected.

The following extract from the *New York Times*, Nov. 3, 1922, refers to the valuation of the estate of Temple Bowdoin:

Transfer Tax Appraiser Berwin, in estimating the value of the good-will interest, accepted the average annual profits for ten years, and multiplied this sum by three. This is called the "purchase value," and is explained by George Brokaw-Compton in a treatise on good-will as follows:

"This multiple, or a number of times the average annual net profit, is held to equal the amount a purchaser would be willing to pay solely for the advantage of continuing the business."

Appraiser Berwin accepted "three years purchase" as the value of Mr. Bowdoin's interest in the good-will over the protest of Lafayette B. Gleason, counsel for the State Tax Commission, on the ground that the appraiser should have fixed the "purchase" at a higher multiple than three. In appraising an interest in the business of Franklin Simon & Co., the multiple of five was fixed by the Surrogate, while the good-will value of stock in Tiffany & Co. was estimated on a basis of ten years purchase. Stock in the Hearn department store was appraised on a multiple of five. It is expected that an application will be made in the Surrogate Court to increase the value of the good-will on the ground that a higher

multiple than three should have been used, and that the basis for the good-will fixed at the present time will be used in later taxation of estates of other members of the Morgan firm.

GOOD-WILL IN THE BALANCE SHEET.—Ordinarily intangible items such as good-will are shown at bottom of the asset side of the balance sheet. In the balance sheet form approved by the Federal Reserve Board the item is omitted entirely on the asset side; but is shown as a deduction from net worth on the liability side. This emphasizes the banker's point of view, viz., that in examining a balance sheet as a basis for loans the value placed on good-will should be **zero.**

COST ACCOUNTING

CONTENTS

(For list of forms, see complete table of contents.)

SECTION 13

COST ACCOUNTING*

Nature of Cost Accounting

DEFINITION.—Cost accounting is a branch of general, commercial, or financial accounting whereby the three components or elements of cost—direct material, direct labor, and burden, overhead, or expense—are calculated for the product made or service rendered in such manner that management can secure accurate and prompt information regarding, and can exercise intelligent and prompt control over, the activities of the business. The **control aspect** as well as the **technical aspect** of cost accounting is thus emphasized.

General accounting shows merely the total profit or loss of the business as a whole, whereas **cost accounting** discloses the profit or loss on each unit, whether job, special order, product, class of product, operation, or process. It is **accounting for units** that differentiates cost from general accounting.

Cost accounting originated in the factory, but it is not now confined to industrial enterprises. It is being used increasingly in wholesale, jobbing, and retail establishments—in fact, in all kinds of businesses, as shown by the growth in the use of uniform systems by many trade associations.

Detailed cost records are kept under one or more of the following types of cost systems (which will be explained later): special order; job; product; class; operation; and process. Furthermore, costs are recorded for some unit of measurement, such as the ton, yard, barrel, piece, etc.

Cost records are "tied into" the general accounting books by means of controlling accounts, such as Raw Materials, Work in Process, Finished Product, and those used for the analysis of expenses.

ELEMENTS OF COST.—As a unit of product goes through a plant it picks up the **elements of cost,** namely, direct material, direct labor, and manufacturing burden. Cost may be defined as any payment or charge for direct material, direct labor, or overhead, the purpose of which is to create marketable assets, finished products, or services to be sold.

CLASSIFICATION OF COSTS.—Costs may be divided broadly into **two large groups:**

1. Manufacturing or Production
2. Selling and Administrative

In the former group are heat, light, power, wages of employees, etc.; in the latter, salesmen's salaries, office expenses, advertising, etc. No attempt is made here to enumerate all items in the two groups.

One purpose of this classification is to make it possible to ascertain sep-

*This section is partly based on "Cost Accounting, Principles and Practice," in the preparation of which book the author of this section collaborated with J. P. Jordan, Consulting Industrial Engineer.

arately costs of the two primary divisions of a business. Responsibility for production and for selling and administration should not, under any form of management, be carried by the same individual. Need of this separation of responsibility is evident when factory and general offices are in different localities. If divided responsibility exists, means should be provided to control it. Control is dependent on information with regard to both the manufacturing and the selling branches of the business, and the information necessary is the cost data. Hence, a cost system should be so planned as to maintain a distinct separation between factory accounts and selling and administrative accounts, and to unify both classes of accounts by controlling accounts.

After costs have been classified so as to separate manufacturing from selling costs, they should be subclassified in order that a maximum of accuracy in recording may be secured. Costs are, therefore, further divided into:

1. **Direct costs**
2. **Indirect costs**

Direct costs are payments or charges for labor and material expended upon a definitely determined unit of product or service. Small costs, however, are not charged directly to the product, even when the latter can be determined, unless the increased accuracy of the records justifies clerical work entailed. It follows that indirect costs are those which cannot be charged directly, for reasons of economy or otherwise, to the product. An example of a direct cost is the cost of the raw material in a chair. Indirect costs arise from the following sources:

(a) Indirect material, such as rags used to wipe off chairs and tools, or new tools used to replace those discarded.

(b) Indirect labor—for instance, wages of foremen who supervise the employees in several departments where chairs are made.

(c) Fixed charges—depreciation, taxes, insurance, etc.

Adherence to the above cost classification increases the accuracy of the records, for this reason: By charging items directly to the cost units (when economical), the remaining costs (indirect costs) are less than if certain items legitimately "direct" were treated as indirect costs. Indirect costs are distributed over the product in as accurate a manner as possible, but such charging is less accurate than direct charging. For instance, raw material can be accurately measured and charged directly against the chair. The depreciation of the equipment used in manufacturing the chair cannot be determined by means of any measuring device. It must be estimated. Consequently, total depreciation of equipment is distributed over all units of product (chairs) made. Any charging which reduces the distributable costs, thereby increases automatically the accuracy of the cost records. Growing observance of the principle of direct—that is to say correct—charging has done much to improve the exactness of cost accounting.

In the early days of accounting, probably no distinction was made between direct costs and indirect costs, since concerns were interested in **total costs** of the business, not in **unit costs.**

IMPORTANCE OF PROPER COST BASES.—Before costs can be properly recorded and intelligently controlled, the right bases of costs must be established and the organization must be departmentalized along correct lines. Units of measurement, around which the costs are assembled, such as pound, piece, yard, are usually determined automatically by the nature of the product made or the service rendered.

More cost systems fail because **wrong bases of cost** have been established than for any other reason, because they lead to incorrect costs which in turn cause managerial policies to be based upon erroneous cost information. There probably is no industry in which it is possible to arrive at the final cost of the product without establishing a long series of **basic cost figures,** the various combinations of which in time will produce the final cost. Accuracy of final cost figures depends on the intelligence with which the various bases of figuring are established.

Another important point in connection with the establishment of the bases of cost is the use of cost figures made by the management itself, including the foremen or department heads of the plant who are responsible for the production of goods at lowest cost.

A cost figure which consists of a mass of data assembled for the sole purpose of setting selling prices falls short of the requirements of a manufacturing institution. Probably the most profitable result of cost-keeping is that of furnishing the means of a careful study of various operations, and, as a result, of making many reductions all along the line. Many figures lumped in one total are of no use to the operating department, even though the total may correctly represent the cost of a certain piece of product. It is of the utmost importance, therefore, before proceeding with any kind of cost work, to establish bases of cost which will not only give the final cost of product, but give it in such form that all operations from start to finish will be represented in a manner which will admit of close regulation.

CONTROL OF COST RECORDS.—In general accounting a **control account** is defined as one which shows in total details found in a subsidiary record. In cost accounting a control account may be defined as one which is charged or credited with all transactions in connection with a certain prescribed function of the business. Electric power and the departmental burden accounts are examples. One definition emphasizes the quantitative feature; the other, the functional feature of control accounts.

If costs are to be of constructive aid to management and to insure absolute accuracy of figures, a scheme of control accounts must be provided which furnishes a means of complete check on all expense and burden accounts. In addition, there must be a series of asset and liability accounts which will automatically provide figures for a balance sheet.

Control accounts may be divided into **three classes:**

1. Accounts with permanent balances, e.g., raw materials, supplies, finished stock, work in process, representing inventories and like data.
2. Accounts with accumulating balances through the year which control the operating burdens, e.g., departmental burden accounts.
3. Accounts which are used each month for the sole purpose of collecting the charges to expense accounts which, after collection, are distributed to burden accounts in the same month, e.g., steam, compressed air, electric power, trucking, etc.

Control accounts, once understood, are readily appreciated, first, because of the assurance they give of the accuracy of all expense and burden accounts; and secondly, because they so greatly simplify the work of cost procedure through the checks which they afford.

All obligations assumed by the company, such as raw materials, supplies, labor, and all other plant items, pass through the voucher register and are

charged to some originating control account—a material account, a pay-roll account, or directly to some expense or burden account.

The object of the controls is to insure the accounting for all moneys paid out. **Material purchases** are charged to the material accounts. The material goes into a stock room and cannot be issued until a requisition is received for it. The requisitions are credited to the material accounts at the end of the month, and debited to the control accounts affected. Direct material which enters a product is charged to Work in Process Material accounts, or simply to the Work in Process account if separate Work in Process Material, Work in Process Labor, and Work in Process Burden accounts are not kept. Material used on expense orders is charged to the control accounts representing the expense or burden receiving the benefit.

Labor is originally charged, when paid out, to the Pay-Roll account. How this labor has been used is shown on the time cards. At the end of the month, the labor is credited to the Pay-Roll account and debited to the control account which receives the benefit. Labor on direct orders is charged to a Work in Process Labor account, or simply to the Work in Process account. If the labor is expended on an expense account order, or an operating burden account, it is charged to the control account affected.

Materials, services, or other purchases made directly for the benefit of an expense or burden account, are charged directly to such control account from the voucher register through an intermediate account called an "Expense Ledger" account. This account is nothing more nor less than a vehicle account to assist in the transfer to the proper expense account.

The control accounts representing expenses such as electric power, trucking, etc., are themselves closed out at the end of the month and journalized to the burden accounts which receive the benefit of the expense.

Burden at standard rates is then credited to the various operating burden accounts, and charged to the Work in Process Burden accounts, or simply to the Work in Process account, in ratio to the number of direct-labor hours or direct-labor cost or machine hours represented by the work performed during the month. The direct material, direct labor, and work in process burden now rest in the control accounts as representing the **value of the material in process;** and are further represented in the files by the requisitions, time cards, and burden statements.

When a production order is completed, these three accounts are credited, and the cost of the order represented by the one figure is then charged to the control account of finished stock or of cost of sales.

DEPARTMENTALIZATION.—Another essential prerequisite of successful costing is intelligent departmentalization, which as the name implies is the division of a concern into departments or production centers.

Departments may be classified as follows: **direct** or producing, and **indirect,** non-producing or service. The first class is engaged in making the individual parts and assemblies that compose the finished product. The second class consists of those departments not directly engaged in manufacture of the product but which render services for the benefit of the direct or producing departments. For example, the tool design department may manufacture tools for individual parts on a job, which are chargeable thereto, or it may make small tools which are serviceable for a variety of jobs, the cost of the tools being treated as a part of the manufacturing burden. Other examples of departments whose work is partly productive and partly of a service character are the blacksmith shop, the machine repair shop, and the pattern department.

It is frequently necessary to provide for **subsidiary** or **minor departments** as well as for main departments. These minor departments are sometimes called **cost centers.** For example, the process of hardening certain parts in a tap and die plant may not warrant maintenance of a whole department for hardening alone. In this case a minor departmentalization is effected in order properly to collect and distribute cost to the parts. Another case of minor or subsidiary departmentalization occurs in a small foundry where one foreman is in charge of all operations. In this case, if proper costs are to be kept, it is necessary to have the following minor departments: melting, core-making, moulding, finishing, and pattern. In all cases, however, much thought and planning is necessary to arrange the most efficient divisions to produce the necessary results.

In many cases it may be difficult definitely to bound a department. The word department implies a separate room, rooms, section, or sections devoted to a certain kind or kinds of work. Where one department begins and another leaves off is an individual problem in each organization. It is difficult to lay down one set of rules or principles to be observed in departmentalization but the factors to be considered are:

1. Assignment of responsibility.
2. Nature of operations:
   (a) With respect to physical movements.
   (b) With respect to costing.
3. Location of operations.

The **assignment of definite responsibility** is necessary from the point of view alike of the management and of the cost accountant. Definite assignment of physical and financial responsibility constitutes the essential conception of departmentalization. Coupled with the assignment of definite responsibility is the necessity of providing means of reflecting results of this responsibility in figures.

The **second important factor** to consider after assignment of responsibility is nature of the operations for which each department head is responsible. In many cases it is necessary to unite, under one responsible head, two departments which have dissimilar operations. A case in point is a small machine shop which manufactures special machine tools with a force of 50 mechanics. If 40 of this number work on individual parts with machine tools, the other 10 do bench and assembly work, and 1 foreman supervises the work of the entire number, the two branches of work in the shop must be treated as two departments, so as to gauge results properly and obtain accurate costs.

An additional reason for this division of work exists in this particular case inasmuch as the plant sells two products: individual parts for repairs, and assembled units. Manufacturing cost per hour for the individual parts is much greater than manufacturing cost per hour for the assemblies, because depreciation, power cost of operating machine tools, maintenance cost of equipment, etc., are higher for individual parts than for assemblies. Since these items do not constitute part of the assembly burden, the assembly burden is a comparatively low figure per hour. Under a single rate of overhead, proper costs could not be obtained for either individual parts or assemblies. As a result, losses would be suffered on sales of repair parts because of insufficient selling prices based on excessive costs. Thus a firm using the single overhead rate would be doubly unfortunate because one of the essential objects of a business of this nature is to sell as many machine

units as possible in order to secure the repair part business which naturally follows. This point will be quickly recognized by those constantly dealing with the problem of **balanced sales.**

Location of operations is the third important factor to consider in departmentalization. Heavy work may be done on lower floors of the factory, lighter work on upper floors. For certain operations more light is required than for others. Operations of a like character may be grouped, although this is not always done. The factor of location of operations is influenced very materially both by assignment of responsibility and by nature of operations.

In case of two similar departments—such as two machine-shops, or two assembly departments—which are in separate locations, even though one person is responsible for both, the fact of similarity is no justification for combining either the two machine-shops or the two assembly departments into a single department. A similar department in a separate location should be treated as a separate department.

The **National Association of Stove Manufacturers**[1] considers the following factors in departmentalizing:

1. Similarity of work.
2. Scope of foreman's supervision.
3. Physical boundary.
4. Control of expenses.
5. Nature of overhead expense and equity of loading it pro rata on all goods produced.

The selection of the proper type of cost system applicable to given conditions should be made when departmentalization is being accomplished.

Purchasing and Receiving

PURCHASING.—Cost accountants must be reasonably familiar with the organization and administration of the purchasing and receiving departments in order to design and operate intelligently a system of records for these departments.

Generally speaking, the methods of the largest corporations are best because they have given more study to business problems and have the funds for research work. In these companies the purchasing agent or head of the purchasing department, whatever title he has, reports directly to the president; in some cases to the general manager.

Requests for purchases originate outside the purchasing department, and the purchasing agent, as the name implies, acts as an agent for other departments in procuring materials and supplies. **Departmental buying** is obsolete and should not be tolerated. Just as there is a vast difference between a salesman and an "order-taker," so there is as great a difference between an "order-placer" and a purchasing agent. The departmental head is an order-placer because he does not know market conditions. Before being sent to the purchasing department, requests for purchase should pass over the storekeeper's desk so that he or the stock record clerk may determine whether the goods are absolutely needed. He may be able to provide substitute material in some cases. However, he will advise the departments of good "buys."

The largest and best-managed companies centralize most of their purchases,

[1] See the uniform system issued by this association.

especially basic commodities such as pig iron, copper, tin, etc., in the main office, under the general manager or a vice-president in charge of purchasing; and sometimes under the general purchasing agent. However, some buying is done by subsidiaries, particularly in emergency cases. The following is a list of the **chief forms** used in accounting for purchases and receipts:

1. Request for purchase (purchase requisition)
2. Purchase order
3. Record of receipt of material
4. Purchasing department shipping order
5. Purchasing department debit and credit memos
6. Purchase record
7. Distribution stamp for invoices
8. Receiving report

Form 1. Invoice Stamp

1, 2. The form that starts the mechanism of purchasing is the **request for purchase** (purchase requisition). From an accounting standpoint the most important thing it should indicate is the account to be charged with the purchase desired. This is true, likewise, of the purchase order. This feature is known as **accounting at the source.** Much later confusion is saved

if this matter is observed. A purchase order should be drawn up so as to constitute a contract. To be sure as to this, a lawyer should be consulted.

3. A record of each receipt of material on each purchase order should be kept so that the status of all orders with respect to deliveries thereon may be known at any time.

4. If purchases do not pass inspection, the return to the vendors is authorized by a purchasing department shipping order. This form is not the same as shipping orders for finished product to be sent to customers.

5. Purchasing department **debit** and **credit memos** are used in the case of undershipments and overshipments, respectively; and in making adjustments of selling prices. Debit memos should be issued as soon as goods are returned,

FORM 2. Standard Invoice Form—National Association of Purchasing Agents

because it may be some time before vendors send credit memos. In the meantime the accounting for the return is not held up. The debit memo reverses the original accounting for the purchase.

6. A **purchase record** is used for significant purchases. As a history of the past, it acts as a guide in current buying.

7. The **distribution stamp** for invoices (a rubber stamp) is used in connection with the approval and distribution of invoices. (See Form 1.)

The National Association of Purchasing Agents has issued a **standard invoice form** which has a space for the usual information carried by the distribution stamp. By using this standard form it is not necessary to use the distribution stamp, thus greatly reducing the labor and expense of handling invoices. (See Form 2.)

RECEIVING.—About the only moot question in regard to **receiving room practice** is whether the receiving clerk should get a copy of the purchase order with quantities and all other data on it; or whether he should make a **blind count** of materials received. The first question should be answered in the affirmative if there is more than one employee in the receiving room. Otherwise, it is difficult to make him realize that his job is important. He should regard himself as receiving room manager and not as a clerk.

The chief record used in the receiving room is the **receiving report.** Three copies should be prepared. One is sent to the purchasing department for checking the quantity on the invoice; one accompanies the goods to the storeroom; and the third copy is signed by the stock record clerk and returned to the receiving clerk who files it for his own protection. All copies are signed by the receiving clerk and the inspection clerk. In a small company, the copy of the original purchase order which the receiving clerk gets serves as an adequate receiving report.

Some **essential matters** to be considered as regards the relation of cost accounting to purchases are as follows:

1. It should be definitely known who may initiate requests for purchases.
2. These requests should be written on prescribed forms which must be reviewed and approved by the purchasing department. They should describe accurately what is to be bought and for what purpose; and should indicate the account to be charged.
3. Orders for purchases must be filled out on prescribed forms. They must be checked against invoices and receiving reports with respect to prices, terms, quantities, and calculations.
4. Each purchase invoice must be handled in such a way that all authorizations, verifications, and approvals have been attended to; and should bear the name or symbol of the account to be charged.

See "Standard Costs" (p. 624) for data on standard material costs.

Cost Accounting for Materials

STOREROOM ORGANIZATION.—After materials, supplies, and finished product bought for resale have been received and recorded on receiving reports in receiving room, they are transported to storerooms which should also contain individual parts and subassemblies and finished product.

Considerable difference of opinion exists as to the organization of the stores department, or what is coming to be called the **materials control department** —a better and more inclusive term, because this department lays out and schedules production orders and purchase orders in addition to taking care of stowage of materials, supplies, etc., and the keeping of stock records.

The question of **centralization versus decentralization** of storerooms requires serious consideration. Modern practice is to establish as many substorerooms as necessary for convenience in manufacture, separating the storerooms which contain raw materials and supplies from those which house parts, subassemblies, and finished product. But there should be **centralization of stock records,** one set being kept to control inventories as a whole.

While general practice still is to place the storeroom under functional supervision of the purchasing department, there is a tendency to have the person in charge of the materials control department or storerooms report to the production department, or to the production control department, if

there is one; because successful production depends so vitally on having adequate material and supplies, etc., on hand. Furthermore, purchasing is such an important function in modern business that the head of this department should not be bothered with material control problems.

Generally speaking, stock records should not be under jurisdiction of the storekeeper, because such practice violates the check and balance principle of management. Clerical work in the storeroom should be reduced to a minimum.

CLASSIFICATION OF STORES.—"Stores," in a generic sense, should be classified into several groups. A serviceable classification is:

1. Raw material and supplies stores
2. Component part or "worked material" stores
3. Finished product stores
4. Scrap stores, including salvage, defective work, obsolete material, and by-products

STOCK RECORDS.—The following terms are synonymous with stock records: stock card; stock record sheet; stores record; balance of stores record; and book, running, going, continuous, or perpetual inventory.

Kinds.—In accounting for stores **four different kinds of records** may be used:

1. Bound books
2. Visible index
3. Stock cards
4. Stock record sheets

The **first method** is antiquated. The activities of firms which sell mechanical accounting equipment, filing devices, etc., have been largely responsible for the **second method**, which is used to advantage by some firms. **Stock cards** are more generally used than the other kinds of stores records, but are being supplanted in many instances by **stock record sheets** with linen-backed separating sheets which make for greater speed in record-keeping and a higher degree of permanence.

Technique.—The information on heading of the modern stock record is practically self-explanatory. See Form 5 (p. 350) of section on "Inventories."

Requirements Columns.—Requirements are estimates of sales or of production. Quantity of each class of raw material or finished parts needed for production or sale is entered in the requirements column. Individual requirements are entered in "item" column and each requirement is added to preceding requirements and sum is entered in "total" column, known as a running total column. Running total columns appear in the other sections of the stock record. The figures in the item column are obtained from shipping orders and from production control or planning department.

Appropriated Columns.—"Appropriated" or "reserved" columns show quantities of material or parts which are set aside for certain orders given priority over other orders. Physical segregation of these items is sometimes made but is not usually necessary. The "quantity" column shows individual appropriation for each production or shipping order. The first "total" column shows total appropriations to date by order numbers, while second "total" column indicates total appropriations to date for all order numbers. When total requirement for an order is appropriated, the entry in the requirements column is checked with last entry in the appropriated column. The appropriated amounts must be more closely compared with the balance of stock on hand and available than the required amounts, because the time of actual need is closer.

Ordered Columns.—Operation of these columns should be clear in the light of foregoing explanations.

Received Columns.—Quantities are entered in "received" columns from receiving reports which accompany stock into storerooms. Prices are entered later when invoices are received and passed along by the accounting department. Entry of quantities need not be deferred until invoices arrive.

Price is the unit cost of each quantity received, which may include not simply invoice cost but also inward charges. If an invoice covers more than one class of material, transportation charges applicable to each class are ascertained by distributing total transportation charges to stock records according to respective invoice cost or weight of each class of material. Occasionally, it may be advisable to treat inward charges, when small, as overhead, but this practice is not recommended.

For finished parts, "price" is the unit manufacturing cost up to time of stowage.

In brief, the received columns constitute the debit part of a stock record.

Issued Columns.—The "issued" section, on the other hand, is the credit side of a stock record. Entries are made from material requisitions—or **stores debit notes,** as they are sometimes called—for material issued to the shop; and from shipping orders for finished product shipped.

REQUISITIONS.—Material requisitions should carry the following information: date of issuance; quantity, size or number, description, weight, price, and value of quantity requisitioned; code order number to be charged; use to be made of material; name of storeroom which fills the requisition and initials of storekeeper; initials of the one who enters the requisition in stock record, the one who makes the extensions, the one who records the amount in cost records, and the one who signs the requisition, respectively. Various persons then are concerned with the handling of the requisition. Each requisition is prepared in duplicate, the originating authority keeping the duplicates in date sequence. The originals after being filled are passed along to the stock record clerk, then to the cost department. No requisition should be honored unless signed by one authorized so to do. It is proper to have more than one class of material on the same requisition, if for the same order. **No requisition** should charge more than **one order.** This practice eliminates many errors.

MATERIAL CREDIT SLIPS.—Returns of material to storerooms for one reason or another are first entered on material credit slips—or **stores credit notes,** as they are sometimes called—and from then on, the reverse of the original accounting, followed when requisitions for them are filled, is adopted.

VALUE OF MATERIAL SPECIFICATIONS.—Recording consumption of material in the best manner is not possible without specifications of material. The value of specifications is well known and the advantages are simply listed here without elaboration: (1) they provide definite knowledge of kind and amount of material which enters each product; (2) they facilitate purchasing, scheduling, control and costing of material; (3) they make for standardization of purchases and operations; (4) they save clerical work.

PRICING MATERIAL REQUISITIONS.—The two chief methods of pricing material requisitions are actual cost and average cost.

The **actual cost method** is best for materials other than staples. However, the actual price should be used where a staple of one general kind is in stock but varies slightly in quality. Prices of stock first purchased are used first on requisitions, then prices of second lot purchased, and so on. Requisitions

of bulk material, such as lumber, are priced at original cost when practicable to keep costs by lots.

While the **average cost method** involves more work than the actual cost method, and consequently is more open to error, nevertheless it is the best method for staple materials, standard individual parts, and finished product.

Current prices in costing may be used, although actual costs may be used on stock records when requisitioning materials. The procedure is illustrated by following ledger accounts:

Pig Iron Control

(1) Contract price.	(2) Average actual contract price.

Vouchers Payable

	(1) Contract price.

Pig Iron Adjustment (P. & L. Acct.)

(2) Average actual contract price.	(3) *Iron Age* price of pig iron for month.

Melt (Work in Process)

(3) *Iron Age* price of pig iron for month.	

The balance of the Pig Iron Adjustment account is closed into the current Profit and Loss account, since it is a nominal (profit and loss) account.

This practice is followed by certain industries which desire to accumulate the speculative profits or losses on purchases, and is in harmony with the principle of basing costs on market conditions.

Running Totals.—The last column in the various sections of the modern stock record form is known as a running total column, showing cumulative figures to date. By having such column in the "received" and "issued" sections, the need of maintaining a "balance on hand" column is eliminated, provided stock records are posted by hand and not by a mechanical device. Several reasons may be advanced in favor of this practice, as follows: (1) the number of times the balance on hand is needed is small in comparison with the number of times it is computed; (2) the balance when needed can

be quickly obtained by subtracting total requisitions from total receipts; (3) by use of running totals most of the work on stock record is addition, and fewer clerical errors are made in addition than in subtraction; (4) balances on hand determined by the "balance" method disclose only a net result, but under the "running total" method they not only indicate such information but also enable questions as to quantity for any period to date to be instantly answered.

But if stock records are posted by a mechanical device, the "balance on hand" column may as well be used, because requisitions and balances on hand are entered simultaneously.

Relation of Columns.—In general, the relation between the different columns of stock record sheets may be summarized as follows:

1. "Requirements" less "appropriations" equals balance of materials or parts, etc., not scheduled.
2. "Requirements" less "ordered" indicates whether requirements are covered.
3. "Requirements" less "received" shows how far behind the plant is in getting material and parts needed for requirements, either from outside or from manufacture.
4. "Requirements" less "issued" shows requirements not issued from stock.
5. "Appropriated" must never be greater than "received."
6. "Appropriated" less "issued" equals balance of appropriated material not issued.
7. "Ordered" minus "received" equals amount due on orders, either purchase or production.
8. "Ordered" must exceed "requirements" by amount of the minimum.
9. "Received" less "issued" equals balance on hand.

Values to be Shown in Stock Records.—The best practice dictates that not only quantities but also values appear on stock records, for following reasons:

1. It is the only way to price out correctly material used. Inventory balances are then correct and accurate financial statements can be compiled.
2. It saves clerical work because the stock record clerk prices each requisition. Otherwise it would be necessary to enter the quantity of each requisition on the stock records, to send it to someone else for pricing, and then to still another for computing and cost work.

Furthermore, pricing should be done by the stock record clerk, since the stock record is the only record showing when each lot of material is exhausted.

The purchasing department is unable to price requisitions, not knowing the exact status of lots, unless it keeps a duplicate set of stock records, which is not feasible and is, furthermore, unnecessary.

TAKING OF PHYSICAL INVENTORY.—Taking the physical inventory all at one time is usually a bugbear. Some firms, today, inventory a few items every day and check them against related stock records, thus eliminating the necessity of a shut-down for purpose of inventorying. During the year each item should be inventoried at least once and compared with corresponding book inventory figures.

The modern and best way of taking a physical inventory, when done at one time, is known as the duplicate tag method. It is described in Jordan

and Harris' "Cost Accounting," Madison Cartmell's "Stores and Material Control," and F. W. Kilduff's "Standard Inventory Manual." See section on "Inventories."

INVENTORY ADJUSTMENTS.—Physical inventories usually differ in their results from book inventories. Nevertheless, the latter if properly kept are usually correct to a reasonable degree. Some **causes of difference** between these two kinds of inventories are: errors and omissions in recording, waste, shrinkage, changes in moisture content, inaccurate weighing, measuring and counting, etc. Differences should be run down, if possible, and corrected or adjusted. Adjustments may be satisfactorily made in the regular columns of stock record, but sometimes are entered in two special columns, "over-credit" and "under-credit," respectively. If adjustments are numerous a special record, **inventory adjustment sheet,** may be provided. Adjustments are debited or credited, as case may be, to an Inventory Adjustment account, or "Over, Short, and Damaged" account, and credited, or debited, correspondingly to the proper material inventory controlling accounts.

After details are adjusted on the stock records, the material controlling accounts "tie in" with subsidiary records—the stock records.

SCRAP AND DEFECTIVE WORK.—An important problem in cost accounting for materials is the treatment of scrap and defective work.

Sources of scrap may be classified as follows: defective or unsuitable material purchased outside, avoidable scrap, and unavoidable scrap.

If the first class of material can be saved, cost of correcting it should be charged back to vendor provided there is a prearranged agreement to this effect. If rejected and returned to vendor, it is billed to him. Any costs incurred in working on the material before defects are discovered, however, cannot be charged to vendor.

Avoidable scrap is the most important of the three classes enumerated. Some subclasses of the major class are: material spoiled because of operator's fault, operating conditions, or errors in drawings, material obsolete because of changes in design, etc.

Unavoidable scrap consists of borings, clippings, turnings, sweepings; product that has been used for experimental purposes; and obsolete and worn-out equipment.

The ideal method of scrap accounting is to establish a salvage department with a set of operating accounts. This department is charged with expenses which it incurs and also a pro rata share of general expense. If it is not considered feasible to open a complete set of operating accounts for the salvage department, because of the clerical work involved, then a scrap account should be opened, which would be charged with material, labor, and expenses in connection with scrap, and credited with salvage value of scrap transferred to stock or other departments, or the value of scrap sold. Any balance in the account at end of year which does not represent scrap on hand should be closed into Profit and Loss account.

It is impracticable and in some cases impossible to credit one kind of scrap directly to production orders, namely, that which results from necessary reworking of material. In this case scrap should be credited to raw material costs, not to general overhead. Crediting scrap to orders is the ideal method when possible or practicable.

When actual amount of scrap which results from each order or item cannot be determined, **standard unit material costs** to be used in costing requisitions

and in charging orders, and standard scrap, salvage, or waste percentages, may be established and credited to orders.

This method has been found suitable in continuous production plants. The argument that it involves too much detail is met by the fact that after standards are set they need not be changed until conditions change.

Another method of handling scrap is as follows: Cost of scrap is credited to work in process and charged to whatever account is designated to receive the cost of the spoiled work pending decision as to either reclamation or final scrapping. If scrapped, a Scrap account is charged and the account which was originally charged with the cost of scrap is credited. When scrap is disposed of, the Scrap account is credited. Any balance in the account is of course cleared into the Profit and Loss account.

The original records for scrap, whatever accounting method is used, are the scrap tickets.

STORAGE CHARGES.—Distributing storage charges over material stored upon the basis of respective weights or values of the material, in some cases, is complex and involves too much detail, but in others is practical. These charges may be satisfactorily handled in the latter cases by including them in general overhead, except where a storeroom serves one department, in which case the storeroom expense should be included in the burden of such a department.

STOCK LIMITS.—The upper limit of stock is known as the **maximum,** and the lower limit, the **minimum.** When material or finished product reaches or falls below the minimum, a purchase order or a production order, as the case may be, is issued for amount decided upon as the **quantity to order.**

The chief factors considered in establishing stock limits for material and finished product are:

Material	Finished Product
1. Purchasing period, or time elapsing between sending of purchase order and receipt of goods.	1. Production period, or time it takes from issuance of production order to the shop until goods are fabricated and ready to be sent to finished stockrooms, warehouse or shipping room.
2. Probable material requisitions.	2. Probable sales.
3. Margin of safety.	3. Margin of safety, varying usually 10% to 25% of probable sales for production period.
4. Economical quantity to purchase, considering terms, prices, deliveries, etc.	4. Economical run, or the largest number of units of product most profitably put through.

Overhead or Burden

BURDEN RATES.—Progressive cost accountants favor calculating and applying overhead or burden by the use of predetermined or standard departmental burden rates. An outline of this procedure follows:

1. Determining normal capacity for direct or producing departments and business as a whole.

2. Determining normal expenses and burdens for normal capacity.

3. Predetermining standard departmental burden rates.

4. Selecting equitable bases for distribution of overhead to expense and burden accounts.

5. Current charging, through monthly journal entries, of actual burden incurred to expense and burden accounts.

6. Current closing, through monthly journal entries, of primary expense accounts into secondary expense accounts, which in turn are closed into departmental burden accounts, one departmental burden account being kept for each productive department.

7. Preparing monthly expense and burden statements.

8. Applying standard departmental burden rates which charge Work in Process Burden accounts and credit Burden Credit accounts. The detailed charges for applied burden are entered on individual part cost sheets or assembly cost sheets as the case may be.

9. Transferring the burden balance of each productive department—which is the overabsorbed or underabsorbed burden—to Profit and Loss account.

10. Recording net result of this summary account in current Profit and Loss account as a deduction from or addition to gross profit—as the case may be—before net manufacturing profit is ascertained.

11. Preparing statements which show monthly comparisons of burden.

12. Revising departmental burden rates when standard burden rates are no longer applicable to current conditions.

Normal capacity, of course, varies for different departments and different industries but, generally speaking, is regarded as 80-85% of practical capacity. In some cases it is greater or less than this figure. It cannot be expected that a plant will always operate at practical capacity, but 80-85% of practical capacity would be considered a good rate of operation.

Some cost men differentiate between theoretical capacity, practical capacity, and normal production.

In non-technical language **theoretical capacity** may be stated as the number of units a machine can produce in a given time under ideal conditions, or, in the case of hand labor, the number of units that can be turned out by the best workers.

Practical capacity, on the other hand, is commonly regarded as 85% of theoretical capacity. This means that an arbitrary allowance of 15% is made for single purpose equipment, spare machines for use in emergencies, and, in the case of hand labor, for losses due to absenteeism, labor turnover, etc.

Normal production is some percentage of practical capacity. It is very important that normal production be correctly established. It should be the purpose so to set burden rates that 100% of normal burden would be exactly absorbed in current costs when operating at 100% of normal. It is obvious, therefore, that the determination of normal production establishes the cost level for the product and may have a vital effect on the successful conduct of the industry. The determination of normal production is so important that it should not be established by the accountant alone but as the result of consultation with the management.[2]

Most cost accountants think of theoretical capacity as the 100% working

---

[2] See Official Publication, Vol. III, No. 19, of the National Association of Cost Accountants, entitled "Normal Burden Rates," by Charles Van Zandt

time of a machine in hours, without regard to the units it may turn out in this time. The burden costs of the individual units will be materially affected by a greater or lesser number of hours charged against the orders.

Most cost accountants, however, regard as normal capacity the figure of 80-85% of practical capacity as stated above, and do not calculate and show theoretical capacity on departmental burden statements.

In determining the normal capacity of the business as a whole, the capacity of the **limiting department,** or the "neck of the bottle," should be taken, although in some special cases each department should be considered separately in determining total normal capacity of the business as a whole.

A pertinent question is, Why use normal or standard rates? The futility of loading all the burden in a given period on subnormal production has been recognized for some time. If actual burden were always charged to current production, either one of two things might happen. If production were plus normal, the actual burden would be relatively low, provided the concern had not reached the point of diminishing returns, because there would be certain burden items that would be fixed and would not vary directly with changes in the volume of production. Therefore, the unit costs would be relatively low because there would be a relatively large number of units of product over which to distribute burden. Selling prices based on these low costs, when production was plus or above normal, would not enable the concern to build up substantial enough reserves for a rainy day. Conversely, if production was very low, unit costs would be very high. Selling prices based upon relatively high costs would not bring in business and the manufacturer would simply accentuate his idle condition. Therefore, selling prices, ordinarily, should be based upon standard costs, provided the manufacturer is not simply using the competitive market prices in establishing selling prices.

Normal or standard burden costs, however, and other normal or standard costs should not be followed too slavishly in establishing selling prices. Until a firm has had sufficient experience to set normal burden rates intelligently, it should use **tentative rates.**

As stated, burden should be handled on a normal basis except under the **process type** of cost system, where the total actual cost, including burden, is divided by the number of units made to get the actual unit cost. However, normal burden can be used in a process system, although usually it is not where one product is manufactured. It is easy to picture mentally the normal burden in comparison with the actual burden.

Before some burden items are collected in departmental burden statements for productive or direct departments, they pass through intermediate primary and secondary expense accounts, such as steam, compressed air, electric power, etc. To be sure, some items like indirect material, repairs, etc., may be charged directly into these departmental burden statements. All burden ultimately must come to rest in some departmental burden statement.

Before expense and burden can be handled properly, a **code of standing orders** must be adopted for each indirect or service department and for each direct or producing department. Firms frequently prepare a booklet containing the standing orders code. The same code number should be used for the same kind of expenditure in every department so that a consolidated burden statement of all departments may be prepared. While some departments may incur certain expenses that others do not, these cases do not make it impossible to prepare a consolidated statement because after certain standing orders there will be no amounts recorded—the spaces being left blank.

A cost accountant is unwise who attempts to lay out a code of standing

orders without first having familiarized himself with the physical conditions in the shop.

DISTRIBUTION BASES.—The bases of distribution of the chief burden items will now be considered.

Rent.—When a company rents a plant, it should obtain from owners a detailed valuation of the various buildings occupied. This information is of value in prorating the rental charge. In many cases the proration is made to departments on basis of square feet of areas occupied, considering that certain areas are more valuable than others. Some concerns use **cubic feet** as a basis, but this factor is not the only one to consider—for instance, a foundry with a high roof does not cost as much as a three-story building of the equal height. The **square-foot** basis, generally speaking, is satisfactory in distributing rent to departments.

Fire Insurance.—If a company belongs to a factory mutual company, its insurance rates are apt to be low, and consequently the insurance may be charged to general manufacturing expense. But if it is not a member of such a mutual company, and insurance rates are high, then cost of premiums may be distributed to departments on the basis of valuations made for insurance purposes.

Insurance is usually taken out separately on buildings, equipment, and inventories, and, if possible, should be distributed to these divisions of assets. If it cannot be traced to them, then it should be distributed on the basis of the percentage that each class of assets bears to total of all assets.

Liability and Compensation Insurance.—Liability and compensation premiums and rates are based upon amount of pay-roll paid out and hazards of the various operations. Premiums are estimates and are paid in advance, being adjusted quarterly to the actual pay-rolls. Where occupations are very similar, as in a small plant, the insurance charge per department may be made on a per man basis according to number of men in the department.

Taxes.—Where a company owns its plants, distribution of taxes on buildings is made in much the same manner as rent, when the taxes are large. If small, they may be treated as a general manufacturing expense, which is apt to be the case when plants are outside the high tax areas. Taxes on personal property should be distributed to departments upon the basis of the respective values of the equipment.

Depreciation.—Unquestionably, depreciation may be handled most satisfactorily if a **plant equipment ledger** or plant asset record is operated. The depreciation of buildings and equipment should be treated separately in the accounts.

The plant ledger may be kept in either a loose-leaf book or a file of cards. Sheets assembled in binders is probably the preferable way to keep this record. In a large plant several different forms, all of uniform style and size, may be used. One form may be employed for individual units, such as large machines, trucks, etc.; another for buildings; another for small tools; and still another for miscellaneous equipment.

For individual units of equipment the form has spaces for the following information: complete description, make, when bought, age, prospective life, numbers, original cost, reduced value, estimated scrap, salvage or residual value, capacity, location, operating requirements, rate of depreciation, adjustments of value, depreciation rate per hour, day or month chargeable to costs. The description should include all attached parts. The ledger should be subdivided by departments so that the total monthly depreciation charge for each department may be ascertained.

The first step in the installation of a plant ledger is to make an analysis of the general plant account. In many cases it is impossible to make this analysis for a long period antedating time of installation of the ledger.

Sometimes the plant account is carried at a value appraised by the directors at time of purchase or reorganization. In other cases plant asset values are established by means of an appraisal made by an appraisal company.

Some companies keep an **asset disposal record** into which the original sheets or cards for the items concerned are transferred at the time of the disposal of assets.

The sum of the items in the plant ledger—a subsidiary record—should of course agree with the control account or accounts for plant items in the general ledger.

Depreciation rates used for the different classes of equipment will, of course, vary. Depreciation on building values is distributed to the various departments upon basis of relative value of the floor area occupied by each department. Depreciation on the section of the building devoted to the general superintendent's office, etc., should be charged to "General Manufacturing Expense." Mortality tables, or tables of depreciation rates, have been adopted by some trade associations which have uniform cost systems.

Most accountants favor the **straight-line method** of handling depreciation. In order to tie in all costs, depreciation on the cost records should be the same as that figured for government taxes. Otherwise adjustments will have to be made at the end of the year.

Steam Expense.—Steam is used to run steam engines in the power plant, to heat office buildings, and for manufacturing processes. Consequently, some of the steam expense is distributed to the Electric Power account and the rest to the General Manufacturing Expense account. The distribution should preferably be made from the readings of flow meters showing steam consumption. If such meters have not been installed, the chief engineer or master mechanic should prepare estimates as accurately as possible as to the steam that each department will use. The estimates are then used in making the distribution of steam expense.

Power.—While the use of meters is the most scientific way to measure departmental consumption of kilowatt hours, nevertheless, probably a large majority of concerns are using horse-power ratings because of the expense of installing meters and the small variation in power consumption between different departments found to exist in some plants.

If a company is maintaining a centralized power plant to serve two or more of its own manufacturing units, the procedure in treating power cost is as follows. **Fixed rates** for power and steam are determined based upon normal production From the consumption as determined from meter readings, each plant and department served is charged at these fixed rates. This method results in a **balance undistributed,** which is the net cost of unused capacity. This additional charge made against each plant is arrived at by finding the difference between the cost of power consumed by the plant at normal fixed rates and the amount which represents its proper share of the total expense of the power plant for the month. This latter figure is based upon both the ratio of normal consumption of each plant to normal power plant capacity, and the ratio of actual consumption of each plant to total actual production of the power plant.

Too many concerns make entirely too detailed distribution of power costs, particularly where power cost is comparatively small in amount. Here is a splendid opportunity for cost simplification.

General Manufacturing Expenses.—Whenever possible without too much detailed costing, items should be kept out of the General Manufacturing Expense account and entered in segregated expense accounts, such as Purchasing Department, Pay-Roll Department, Cost Department, General Superintendent's Office, etc. The General Manufacturing Expense account is usually the last one to be prorated to direct or producing departments.

In the past it has been rather common to distribute this expense to departmental burden accounts on the basis of the respective direct-labor cost of each direct department. This basis is erroneous because the expense is incurred as much for the benefit of indirect as for direct labor. Therefore, total labor (direct and indirect) hours, total labor (direct and indirect) cost, or the total number of men, are more accurate bases to use.

General manufacturing expenses are distributed according to the ratio that the total pay-roll of each direct or producing department bears to the total pay-rolls of all the direct or producing departments.

When many departments operate at normal capacity, it may be unfair to distribute all of the general manufacturing expenses according to the above bases. For that reason this expense may be distributed upon the basis of **a standard charge** per dollar of total pay-roll based upon normal capacity throughout the plant. This standard charge is determined by dividing total normal general manufacturing expense by total normal pay-roll. This charge is then applied to total pay-roll of each department to get the share of general manufacturing expense to be borne by that department. Hours instead of dollars are sometimes used as a basis for such charging. Unabsorbed balance of general manufacturing expense is closed into unabsorbed burden for the whole plant.

In applying burden, normal burden is divided by the burden basis in a normal period to get the predetermined burden rate—burden rates, as stated before, being arrived at for each direct or productive department. These rates are then applied to the job, product, or operation, etc., depending on the type of cost system in use, in a current period, to get detailed burden applied or earned, according to burden basis selected. This burden is shown in the burden statement for each department, together with the actual burden which is segregated opposite the standing orders. The total burden applied for all departments is charged to a Work in Process Burden account or simply to the Work in Process account. The burden credits are made to Burden Applied or Burden Credit accounts. Differences between actual and applied burdens are handled in the manner explained on p. 626.

METHODS OF APPLYING BURDEN.—The advantages and disadvantages of the different methods of applying burden will now be discussed.

Direct-Labor Cost Method.—This method is simplest and easiest to operate because pay-rolls must be prepared and labor costs can be easily secured for burden purposes. The method is serviceable where production is uniform and continuous, where labor is the chief factor, and where wages are fairly uniform.

But the advantage of knowing elapsed time for scheduling and planning purposes is lost under this method. It is not suitable where production is fluctuating and seasonable, where wages paid on the same class of work are not uniform—in this case the product of workers earning a bonus being penalized—and where bench work and machine work are performed in the same department.

The severest criticism of the method, however, is that it is based on cost rather than time, and burden bears more of a relationship to time consumed than to labor cost.

Direct-Labor Hours Method.—The direct-labor hours method, however, is based upon time, which is the chief reason for its accuracy. It is a simple method to use where production is uniform. Disadvantages of the method are small when compared to the advantages. The method may be inaccurate where machine and bench work are performed in the same department, and where production fluctuates.

Machine-Hour Rate Method.—In modern plants technical processes are intricate and complex. Homogeneous operations are limited to small areas. Machines and equipment are vastly different, and each machine or group of similar machines in one department affords a natural rather than an artificial unit for the incidence of burden, provided machinery is the chief factor in production, also the quantity of production is large.

While there is considerable detailed work involved in first arriving at machine rates, thereafter the machine rate method is easy to apply. There is no question, however, but that the machine rate has been overdone and the detailed work in determining the rates in many cases has not been justified. If the machine rate records are not carefully kept, ridiculous inaccuracies result. Another disadvantage raised against the method is that it is not applicable where machine work and bench work are done in the same department.

Machine Rates.—Differences of opinion still exist as to the extent to which machine rates should be used in distribution and application of burden. Some cost accountants consider all overhead elements in arriving at a machine rate, and in some cases even labor is included where it is difficult if not almost impossible to record labor costs against a particular product going through a machine because of the fact that operator may be changing jobs so frequently. A principle observed in determining machine rates is: The job should be charged with the various items of manufacturing cost as it has been benefited from their having been incurred.

Use of machine rates does not mean that a machine rate is calculated for each individual machine or operation. Sometimes machines are grouped together in a **production center** where there is uniformity as to the nature of the work performed, the amount of investment employed, or the service rendered.

Other cost accountants contend that there are **three main items** that fluctuate primarily with the running time of machines, namely, depreciation, power, and maintenance. Consequently, they use a supplementary or superburden rate for these items only, and handle the rest of the burden items through a "regular" departmental burden rate. Cost sheets, therefore, have columns showing separately the regular burden and the superburden. Opponents of this practice contend that it makes use of two burden rates when one rate would serve the purpose just as well; and that in many cases all burden should be considered in setting machine rates.

The application of machine-hour rates to boy labor where men and boys work on the same machines, raises an interesting question. Men are apt to do jobs more quickly than boys, and while men get a higher wage, the overhead on the jobs is less in the case of the men because of the shorter time they take There seems no adequate reason why **differentiated burden rates** for man and boy labor should be employed in this case in costing the product If boys are adequately trained, higher costs of product during the training period will be reduced later when the training period has ceased.

An account called **Training Expenses** may be set up, against which is charged that portion of the cost by which the boy's labor, plus the machine-

hour rate, exceeds the experienced workman's labor, plus the machine-hour rate. This practice, however, may lead to abuses on the part of the shop in diverting perfectly proper and legitimate excessive costs.

STANDING ORDERS.—A code of standing orders or standing order numbers should be prepared, showing the proper analysis of burden expenditures; there being a standing order for each major burden item, such as indirect labor, depreciation, taxes, repairs and maintenance, etc. This code cannot be drawn up until one is reasonably familiar with operations in the plant and activities of the service departments.

BURDEN STATEMENTS.—A burden statement for each direct or productive department is prepared each month. A sample statement appears in Form 3. This form contains a column "normal" which appears rather infrequently on burden statements. Usually the normal or standard burden is calculated for each department as a whole and not for each standing order on the statements.

A consolidated burden statement of all departments should be prepared monthly.

FACTORY LEDGER ELIMINATED.—One progressive step in cost accounting within the past few years has been the elimination of the so-called factory ledger. This has been accomplished by the increasing use of expense and burden statements which really constitute the factory ledger so far as burden is concerned, because they show a sufficiently fine analysis. Where this is the case, a group account known as the "Factory Burden Cost" can be opened in the general ledger, this account showing actual burden cost of all departments; and another account, "Factory Burden Absorbed or Applied," showing, as the name implies, the total factory burden absorbed by applying the predetermined departmental burden rates.

Space will not permit of a treatment of the other steps listed in the outline of burden procedure. However, they are either self-explanatory or pretty well understood by cost men.

Accounting for Labor

BASIC LABOR RECORDS.—Accounting for labor in the plant, pay-roll office, and in connection with burden costs, has the following objectives:

1. To determine wages due each worker in order that pay-rolls can be prepared, and so that no worker will be paid more than he has earned.
2. To determine labor costs by units, production orders, operations, etc., and by departments, so that proper direct-labor costs can be entered on cost sheets.
3. To obtain data for calculating burden and for charging departments with indirect labor.
4. To procure information for proper control of labor costs.

The following is a brief description of the essential forms used in reaching these objectives:

1. **Weekly in-and-out card.** Each worker has one of these cards which he uses in ringing "in" and "out" on the time clock. The difference between the "in" and "out" time is supposed to indicate the time the worker has been in the plant each day and is checked against the total elapsed time as shown on the time cards turned in for each

worker and time tickets for idle time turned in by the timekeeper. Thus the idle time of the worker is ascertained. The clock cards also are of service to the pay-roll department in locating differences in the pay-roll.

2. **Late and absent and overtime reports.** The use of these reports is implied in their names.

3. **Time cards.** Time cards vary according to the kind of labor information desired and the wage system in use, particularly the latter.

There are two chief kinds of time cards—one for direct or productive work and another for indirect or non-productive work. The first indicates the labor chargeable to a production order (Form 4); the second, the labor chargeable to a standing order (Form 5). A **recapitulation card** (Form 6)—called the bonus and premium report—is used in conjunction with the direct-labor card under the premium or bonus system of wage payment.

Time cards should be prepared by a time or dispatch clerk instead of by the workers. If the plant is large, there may be several clerks who perform this function, each one being able to keep the time of from 60 to 100 workers. Workers dislike "bookkeeping" of any kind. Furthermore, it is more economical to have clerks for time recording. Actual tests have shown the latter practice to be decidedly the cheapest.

In some concerns, upon receipt of bills of material and blue-prints, the time-setter prepares a time card for each operation or each job. He shows thereon the time allowed for the operation and the machine or group of machines on which the operation is to be done.

All time cards are forwarded to the pay-roll department and there used in drawing up pay-rolls. In some cases time cards are first forwarded to the production department, and then to the pay-roll department, and later to the cost department, the same records serving all purposes.

Bonus or **premium cards** are made out in duplicate. The original is given to the worker so that he can check up his earnings and calculate his total wages for the pay-roll period. The duplicate is sent with the product to the inspector of the product, and later it is forwarded to the pay-roll department. Bonus is usually figured weekly and not daily. It is good practice to insert in the worker's pay envelope a slip showing how his bonus was figured.

Daily statements of piece-work earnings may be given to the workers, although they usually keep their own count of piece-work.

Labor accounting is greatly expedited by time-recording devices and tabulating equipment.

Some special matters arise in labor accounting. These will be briefly described.

LOANED WORKERS.—The first has to do with loaned workers. The following practice in recording loaned labor is somewhat detailed and is not used by many plants.

When no burden charge is involved, in the case of the loaned worker, his pay-roll number is not changed. The time or dispatch clerk of the department (home) where the worker is customarily employed makes out two cards, which indicate, among other things, the department to which he is loaned. One card is kept in the home department; the other is turned over by the worker to the time or dispatch clerk in the department to which the worker is loaned. The clerk sends the time cards of the worker back with him when he returns to the home department. Then they are forwarded to the pay-roll department.

Some contend that it is not necessary to use special records, such as loaned labor reports, for workers transferred temporarily from one department to

FORM 6. Bonus or Premium Report Card

another. These cases, they believe, can be handled in the following manner: Each worker gets a time card for each job he works on, and for each indirect labor task, reporting his time on separate time cards for each department in which he works. He has only one time-clock number, and hence it is impossible for him to receive duplicate pay.

By sorting time tickets to charges or charge accounts, and being sure that the labor charges agree with the pay-roll total by man number, the cases of workers loaned by one department to another, where a burden charge is involved, and where no burden charge is involved but only the labor cost, are satisfactorily taken care of. Furthermore, the detailed procedure for "loaned workers" described above is infrequently needed because most firms do not separate the pay-roll into departmental pay-roll accounts.

SHORT OPERATIONS.—The last special matter in accounting for labos deals with short operations. When operations are of short duration, it ir often impracticable to charge the direct labor involved to production order numbers through time cards, because many sizes may be handled together in one operation and each size may be on a separate order. Hence, these manufacturing operations are called "short operations," and code numbers are provided for them against which the labor involved is charged. Such accounting should be minimized as much as possible because it does not allow close cost analysis.

FINAL DISPOSITION OF TIME CARDS.—After time cards have been filled out, they are checked. They are then placed in numerical sequence and forwarded to the pay-roll department. There the next step is performed, namely, rating and extension of time cards. This work should be checked by someone who has not done the original work, so as to insure absolute accuracy. Now the cards are used in compiling pay-rolls.

Pay-Rolls

TIME CARDS.—Time cards are the originating records used in the preparation of pay-rolls, the objects of which are:

1. To calculate the wages of each worker.
2. To assist in labor control, and partially in burden and work in process control.
3. To determine the units of product made by each workman on direct operations.

The third object is not always accomplished by the pay-roll because the units of product made are shown on the cost sheets.

Time cards should reach the pay-roll department arranged according to the numerical sequence of the check numbers of workers.

PAY-ROLL SHEET.—The **basic record** in pay-roll work is the pay-roll sheet, a copy of which appears in Form 7.

Before the columns of the pay-roll sheets are filled out from time cards, the heading of the sheet should be written up, showing the department name, the name of the worker, his day rate and check number, and the dates of the pay-roll period. This saves time in preparing pay-rolls.

A brief explanation of the entries in the columns will be made.

The **slip numbers** are the numbers of the time cards of workers. The "charge" column shows the **order numbers** to be charged for the work done by employees. These order numbers may be either for direct (productive) work on production orders or indirect work on standing orders.

			Hrs.	Min.	Amount	Hrs.	Min.	Amount	Pce Work	Hrs.	Min.	Amount	Pce Work	Hrs.	Min.	Amount	Pce Work	Hrs.	Min.	Amount

FORM 7. Pay-Roll Sheet

It is not absolutely necessary to have the "transfer" and "O. D. S. O." columns on the pay-roll sheet, but they are shown on the form simply to indicate that such information appears on pay-rolls sheets in some cases.

Day-work and piece-work wages are entered in the "amount" and "piece-work" subdivisions of the "direct" column, respectively. The same is true of the "indirect" column.

The "total" column shows the total earnings of each worker for each day.

At the end of the pay-roll period, all columns of the pay-roll sheet are footed vertically and cross-footed to agree with the sum of the total column. If the work checks, it indicates that it has been done accurately.

The next step is to enter at the bottom of the sheet the **premium** or **bonus earnings** of each worker in case they are not shown on a special sheet. These "deductions," such as stock subscriptions and Liberty bond payments in behalf of workers, are entered to get each worker's net pay for his pay envelope. Sometimes these deductions are entered in a special column provided for the purpose.

In some plants the sheets have spaces for this information:

Entered by—	Checked by
Extended by—	" "
Added by—	" "

Some sheets also have a space "Income tax posted"; and columns for the weekly rate and the hourly rate of earnings; and overtime hours and earnings.

Where a special method of wage payment is in use, workers should be informed as to the procedure in compiling pay-rolls. Otherwise they may feel that their wages are not being calculated correctly.

SPLITTING PAY-ROLLS.—One step in pay-roll accounting is known as "splitting pay-rolls." Many times when the pay-roll period is one week, the end of the month falls in the middle of the week. In such cases it is necessary to enter the cards of the last working day of the month and to rule footing lines after the entries of this day. Then the entries for the remaining days of the week are made. After all the entries are in for the last day of the week, another subfooting line is ruled in. The pay-roll sheets down to the first subfooting are now added; and then the balance of the days of the week down to the second subfooting—each section being added separately. In order to arrive at the total for the week, the two subfootings must be added.

The next pay-roll operation is to arrive at the total of the pay-roll for each department, by adding the total time and amount of wages for each block on the pay-roll sheet. These totals are determined for each pay-roll period and also for each month.

The pay-roll check is drawn for the total of the wages for the pay-roll period. This figure is charged to the Pay-Roll account and of course credited to cash. But unless the pay-roll period coincides with the cost period, there is in the balance sheet a liability, Accrued Pay-Roll, because pay-roll entries are made in advance of the payment of the last pay-roll.

DISPOSITION OF PAY-ROLL.—At the end of the month the Pay-Roll account is credited and the Work in Process account charged for the grand total of the direct labor shown on the pay-roll sheets, and the proper departmental burden accounts are charged for the indirect labor.

In the cost department, time cards for direct work are charged to production orders; and those for indirect work are filed in back of the standing orders and used in preparing the monthly departmental burden statements.

Standard Costs

TERMINOLOGY.—Much confusion arises on subjects of cost because of lack of standardized or uniform terminology. An example is the loose use of the words **standard** and **standardization.**

There are various phases of what might be called the standardization problem, such as standardization of product, machinery and equipment, operations, methods, cost, and terminology. Furthermore, even the terms, standard costs, average estimated cost, and budget cost, are not always used with precision. Standard costs may be defined as costs based upon normal production rather than on average production, due regard being had to both current conditions and what is known or anticipated with respect to the future. Normal production of an organization varies with the industry but is usually regarded as 80-85% of the practical capacity. Not only normal production, but also current and probable future conditions, should be considered in determining standard costs.

Average estimated costs, as the name implies, is the estimated cost for a future period based upon past averages.

Budget cost may be set for varying speeds of production—30-60-80-90%, etc., of maximum production. Alternative budgets for these different speeds of production are sometimes prepared. But budget cost may correspond to standard cost in case it is estimated that a forthcoming period will be a normal one.

SETTING OF STANDARDS.—The preparation and recording of standard costs will be briefly described.

MATERIAL STANDARDS.—Standard material costs are based upon the specification sheets, rates of past material consumption (regular and waste), contract prices, current market prices, past and prospective prices and costs. If a firm has inadequate past records for establishing material standard costs, it may put a given product through a test run to determine standard material consumption for both quantity and cost. However, a test run is often not satisfactory because it does not represent a fair standard performance.

Standard prices for materials bought are sometimes carried into the records. The procedure briefly is as follows: A sticker or distribution slip is attached to an invoice or an invoice stamp is used, the standard purchase price in addition to the actual price being inserted on the invoice. The stock record clerk, after receiving and entering on the stock records the receiving slip for the goods transported from the receiving department to the stores department, forwards it to the purchase department, where the sticker or distribution slip is filled out with the standard price of material purchased. If quantity on invoice and that received vary, the difference, if large, is adjusted with the vendor. If not large enough, it is shown as a loss or gain, as is also the difference between the actual price of material and standard price.

At end of month a summary is prepared showing losses or gains on each class of material bought.

Standard prices of material are adjusted when conditions warrant, in many cases only once a year. They are not used in connection with all material purchases, as in the case of some expense materials and supplies, and material purchased for a special order. In these instances actual cost is charged direct.

LABOR STANDARDS.—In determining labor standards, standard **rates of pay** are established for each department. being based upon the average

earnings of workers on a given class of work at the time the standards are set. If there is not sufficient experience upon which to base standards, **time studies** may be made. Such studies, however, are practical only in continuous process industries—not in a special order or jobbing business, where orders vary so widely. An order made one month may not be made again for several months. But in this case an estimated cost may be arrived at against which actual cost of the order is checked.

Some firms record both standard time and labor cost, and actual time and labor cost, on time cards or tickets. The total standard labor costs for each department are also calculated.

Some firms carry both the standard and actual labor cost into parallel columns in the Work in Process accounts by lines of product for comparison purposes, and the ratios between the standard and actual labor costs are calculated and shown in these accounts.

But in the case of **piece-work,** some contend that the rates are the labor cost standards, so that there is no necessity of placing the standard time on the time cards. In such cases, however, when examining the pay-roll it is often discovered that for various reasons day-work allowances to apprentices and to experienced workers have been made in setting labor standards. This matter may be handled by charging all of these allowances to burden, thus leaving in the labor accounts the exact amount of production times the piece rates. Others believe that any allowance made should show up as a variation from standard labor costs. However, no factory probably will ever run 100% on piece-work.

STANDARD BURDEN.—The calculation and application of predetermined departmental burden rates have been explained on page 608. In this section, attention will be devoted to three questions:

(a) Length of time to be considered in arriving at these burden rates as well as standard labor and material costs.

(b) Method of recording unearned or overearned burden, as the case may be.

(c) Frequency and method of writing off the difference between standard burden and actual burden.

(a) There are two points of view with respect to the first problem. One is to use the fiscal year in setting predetermined burden rates; the other is to use a cycle of years.

An excellent statement with respect to the latter practice is found in the uniform system of the Electrical Manufacturers' Council issued Oct. 1, 1922. The statement follows:

> The fiscal year is largely an arbitrary period and may not represent average conditions. Consequently, the attempt to absorb the indirect expenses in the costs of the fiscal period in which they are incurred may work injustice or entail loss. It is, therefore, sound accounting and good financial policy to recognize, in determining the cost of production, the principle of the continuity of time.
>
> To avoid violent cost fluctuations, normal or mean average rates based upon a cycle of years should be used in cost estimates and in costing production and shipments. It will take study and care to determine such rates and to keep them normal.
>
> It is recommended, therefore, that:
>
> (1) Normal or average rates (based on direct labor, direct labor hours, or machine rates) be established for separate departments or classes of product and used for cost estimates and in costing production and shipments.
>
> (2) A separate "Reserve for indirect manufacturing expenses" be set up for each department or class of product, created primarily from amounts over-liquidated, i.e., amounts charged costs of production in excess of actual indirect manufacturing ex-

penses, during periods of abnormal production, when the rates used in costing are higher than the actual. If the reserves established in this manner are insufficient, they may, if the Board of Directors approves, be supplemented by appropriations from surplus.

(3) Under-liquidations of indirect manufacturing expenses, during periods of subnormal production, in any department or class of product, be charged against its reserve.

(4) Constant study and comparisons of the production and expense factors be made by means of charts and statements, so that the established normal or average rates may be periodically corrected or revised as experience or conditions may require.

(5) Inventories at the close of the fiscal year should be valued, for balance sheet purposes, upon the basis of normal rates of overhead.

NOTE: When, a a policy of conservatism, an adjustment of inventory is made to the basis of curren overhead cost, in those years when current rates are lower than normal rates, this adjustment should be a temporary entry to be reversed at the beginning of the succeeding fiscal period, and this practice should be interpreted as the exercise of executive conservatism rather than cost accounting procedure.

This statement also bears on the third problem raised above.

(b) In booking the difference between standard and actual burden, two accounts may be set up for it, one called "Burden Variance" and the other, "Unearned and Overearned Burden." The former shows the difference between the estimated and the actual burden; the latter, the difference between the estimated burden and the burden applied at predetermined standard rates. Those who favor this method contend that there are **two distinct factors** in the difference between the standard and the actual burden; and that they are overlooked if only one account is kept to show the difference. However, others contend that keeping these two accounts for the difference complicates the bookkeeping, and that the difference can be analyzed well enough by simply setting up one account—the Unearned and Overearned Burden account.

Some of the reasons which cause the difference are: variation in labor rates and efficiency of labor, idle equipment, etc.

(c) The usual practice is to write off to Profit and Loss the differences between burden applied at standard rates and actual burden, at the end of the year instead of each month, because an underabsorption one month may be offset by an overabsorption the next month. Still, some cost men contend that the most scientific way of handling these differences is through a Reserve for Overhead account; the business cycle, rather than the fiscal year, being considered in setting up the reserve.

The Machinery Builders' Society which issued a uniform system—"Standard Accounting and Cost System"—in January, 1922, favors the practice of writing off the differences monthly or yearly. The following is a quotation from this system: "The **unapplied indirect factory expenses** created by subnormal production should be charged off each month against operations or at least at the end of each closing period. Conversely, if due to abnormal production, an excess amount of indirect factory expenses has been applied to cost, such amount should be credited to cost of operations."

The writer favors the yearly practice. It is not good policy to defer burden during a period of declining prices, because there may not be sufficient profits to wipe off the deferred charge and a concern is simply postponing a matter that might as well be faced earlier and disposed of, and should not rob future years of the income which properly belongs to such periods. Those who favor the "reserve method" as outlined state that it makes provision in advance for just such a contingency.

Statement of Variation.—Some concerns prepare a statement showing the

variations between actual burden and normal burden, arranged by departments and months. Such a statement contains the following information: normal burden basis (direct labor hours, or whatever it is); actual direct-labor hours; actual burden, in a total figure; burden rate; total burden applied at the burden rate; variation (loss or gain) between normal or actual burden; and the variation (loss or gain) between normal and actual burden to date.

FINAL DISPOSITION OF STANDARDS.—Standard costs may be posted to the cost sheets against which actual costs are checked.

In preparing the profit and loss statement some cost accountants show the standard cost of sales and below this item the various accounts representing the variations between actual and standard costs. The difference, therefore, between standard cost of sales and these "variation" accounts equals actual cost of sales.

ADVANTAGES OF STANDARD COSTS.—The following is a succinct statement of the outstanding advantages of standard costs:

(a) They are useful in setting selling prices.

(b) They are used in valuing inventories. For this purpose standard costs carefully established are apt to be better in the long run than actual costs of a given period.

(c) They are valuable in controlling and reducing costs, and promoting efficiency. Efficiency is a relative term. A manager cannot determine the efficiencies of men, machines, departments, etc., unless there are standards against which actual performances may be compared.

SERVICEABILITY OF STANDARD COSTS.—An interesting question is: To what extent are standard costs serviceable? Or, to put it in another way, Can standard costs be used to advantage in all of the types of cost systems discussed on pages 628 to 635?

In the **special order type** of cost system, standard costs are not worth much because each job is apt to vary so greatly in nature and cost. In this case, however, the cost of each order may be estimated and checked with the actual cost. It should be emphasized, however, that this estimated cost is not a standard cost.

In all other types of cost systems, however, standard costs are very useful. In some cases it is too expensive to record actual costs. Then standard costs should be used. In other instances, actual costs cannot be obtained, as in a joint product industry where products move along together up to a certain point. Actual costs are not so necessary in a **continuous process industry.** In some instances actual costs are not typical—then standard costs should be used.

Another question relating to standards frequently raised is: As a check on production, is not the establishment of standard units of time for labor and material sufficient, without extending this time into money, admitting the desirability of standard costs for inventory purposes? One point of view on this matter is that, if these standard unit times are arrived at, it does not require much additional work to calculate standard costs. Another point of view is that the most important thing is to determine these standard unit times and then if care is taken to see that production is going through in standard time, the costs will, to a great extent, take care of themselves automatically. Hence, no real need exists of carrying standard costs, with the exception of burden, into the Work in Process accounts.

Types of Cost Systems[3]

SYSTEMS CLASSIFIED.—One of the most important phases of cost accounting is to select and use the best type or types of cost systems suitable to each individual company. Too many cost accountants assume that the type of cost system which they have inherited or devised themselves is necessarily best fitted to existing conditions, which too frequently is not the case. By accepting the *status quo*, irreparable harm may be done in decreasing the usefulness of a cost system to the management. Seldom can one type be used advantageously in all departments of a given concern.

The best main classification of cost systems, the writer believes, is:

1. Special order
2. Product
3. Class
4. Operation
5. Process

The **chief features** of each of these types will be considered in turn.

SPECIAL-ORDER TYPE.—The special-order type of cost system gets its name from the fact that each customer's order, when translated into a production (or factory) order, is separately costed apart from all other orders; and because each order is more or less special. Each order calls for the manufacture of a certain number of units. This type of cost system is, without doubt, still the most common and hence the best known. But it is too prevalent and often is unsuitable, but fortunately is being widely supplanted.

Direct material and **direct labor** are charged directly against the order, and **burden** is applied to the order usually according to one of the three common methods of handling burden, viz., the direct-labor cost, direct-labor hours, or machine-hour rate. When the detailed costs of the order are assembled on the cost sheet for the order, the total cost is divided by the number of units, tons, yards, etc., to get unit cost of the order. The costs of orders are usually compiled too late to be of service in day-by-day control.

While an order is still in process it may be necessary, because of a rush demand by a customer, to make a partial shipment of the units completed on the order to the customer, but the entire cost of the order cannot be determined until all the order is completed. If this is the situation, however, care should be exercised to arrange quantities on orders so that the costs of the order can be calculated as soon as possible after its completion. Individual parts may be made in one set of quantities and sub- or minor assemblies are turned over for major or final assembly. But there is usually trouble in charging parts costs to assembly costs, even though care is taken to limit quantities on any orders. Assembly work usually begins before all the parts necessary for assembly are done.

Nevertheless, this condition may be handled in the following manner, which, however, is not entirely satisfactory:

The last previous cost or the standard cost of parts may be used in costing assemblies. However, in this case standard costs should be employed only in case there has been sufficient past experience upon which to base them. But this standard cost is not the usual ideal standard cost based upon normal production but rather one based upon the figures for the previous two or three months.

Delivery sheets or forwarding slips or sheets show completion of parts as they are forwarded into a parts stockroom. Parts are entered on stock rec-

[3] Some of the material under this heading was suggested by writings of Mr. A. F. Stock in Bulletin of Lybrand, Ross Bros. & Montgomery, N. Y.

ords as completed at the last previous cost or standard cost mentioned above. Under this method, parts are then requisitioned for assembly at the previous or standard cost figures. This procedure does not mean that the actual costs of the order are not assembled later. The actual costs become the basis for the "next previous" cost. When actual cost is entered on stock records, next average price can be adjusted to take care of difference between actual, and estimated or last previous cost.

The point was made above that under a special order system, **partial shipments** are often made. These must be accounted for on the profit and loss statement. The estimated cost of these shipments cannot be credited fairly to the actual cost in the Work in Process accounts or to Finished Stock accounts. Consequently, an offsetting account, "Estimated Cost," is opened. This account is credited and cost of sales is debited with the estimated costs of the partial shipments, which, as the name implies, is an estimated cost based on previous cost or standard cost.

The **cost sheet** for the order has a space for noting whichever one of these costs is used.

Later, the Work in Process account is credited with total actual cost of the order, the estimated cost account being charged with a sufficient amount to wipe it out and the balance is debited or credited, as the case may be, to cost of sales.

The special-order system should be used only in industries where material, labor, etc., vary considerably. It is used chiefly in jobbing shops. Because orders are costed late and because each order may be different than every other, the shop management can make no intelligent use of order costs. But the shop management may get some value out of costs of orders if they are shown on a sheet analyzed by classes of products, by major operations, and given per unit, ton, piece, etc.

In determining the cost of an order it is not sufficient to get the material and labor costs in total. Material costs of parts and labor costs by operations should be shown on the individual parts cost sheets; and of course the total costs of parts are carried over to the assembly cost sheet.

Samples of cost sheets appear in Forms 8, 9.

PRODUCT TYPE.—The product type of cost system is applicable where a company is making a standard catalog line of goods, manufacturing the same product over and over again. In this case order numbers are disregarded and costs are charged against product or part numbers, for the reason that it is impractical to try to separate lots of orders going through a plant of the character just mentioned. Furthermore, quantities vary considerably as between operations. Work is scheduled by referring to a definite quantity of a part number to be made on certain operations. Then, too, there is no **physical check-up** between one operation and another with respect to the quantity finished on any particular order number. The costing is simplified if there is little or no defective work or spoilage. Time cards are filed against the product or part number by major operations; quantities made, of course, being noted.

Labor and **burden** are divided by total quantity made on an operation for the period, in order to determine an operation unit cost. Because quantities vary as between operations, in order to get the total cost of a part for a period, the individual operation unit costs must be added. Where there is no spoilage, the final quantity completed can be multiplied by the total of the individual operation unit costs and the Work in Process account credited accordingly.

FORM 9. Assembly Cost Sheet

Where a large amount of **spoilage** occurs, the cost methods used under the product type are somewhat complicated. The procedures to be described are used only when quantities made are large. A separate cost sheet is prepared for each product or part number; also for minor assemblies; and for major assemblies. Labor and burden are charged by operations, and the total of these two major costs divided by the quantity made shows total labor and burden cost of each unit of product completed. The cost thus far includes that of both bad and good pieces. Opposite each operation cost is shown the quantity defective at each operation. Multiplying this figure by the total cumulative unit cost up to this point gives total labor and burden loss of defective pieces. The figures in the columns on the cost sheet are added. If all pieces were good, the work in process could be properly cleared, but because of defective work, a certain figure must be added to this total cost to provide for a loss which otherwise would never be credited to work in process.

Divide the total loss of defective pieces, which includes labor and burden, by the final quantity of good pieces made at the end of the last operation which gives loss per good unit. Adding this loss to the previous cumulative cost of each unit, gives total labor and burden cost per unit. Then adding material cost per unit good, gives total factory cost.

Some of the **advantages** of these methods are: Actual costs of each operation for quantities completed are secured regardless of order numbers or lot numbers. This is quite serviceable to factory managers, rate-setters, time-study men, etc. The inspection department, of course, reports defectives on each operation.

It is not necessary to wait for costing of orders before any credit can be made to work in process, but actual costs for the previous period can be posted to stock records and used as against whatever parts were made during the month.

In many companies, the same results as described might be secured through proper production planning and control and issuance of shop orders for large lots, representing several hundred actual or anticipated customers' orders. But production orders are frequently not handled in this manner, and hence use of product costs is simpler and safer.

If spoilage is negligible, simply divide costs by production to get the unit costs. If no inspection department exists, and no standard waste percentages have been set, an easy way to get spoilage out of Work in Process accounts is to have each department physically segregate its scrap and turn in periodical reports showing parts scrapped and their stage of completion. The cost can be credited to Work in Process and charged to the Scrap account, which becomes a part of general factory expense. Sales of scrap are credited to Scrap account and the balance is a loss which goes into Profit and Loss account

CLASS TYPE.—The class cost system possesses utility where products are made in small job lots in great variety. Under this system articles are grouped into classes and costs are calculated for each class on some suitable unit basis, such as pounds, cubic feet, etc. In some instances, costs may be analyzed further for the articles in the class, while in other cases such analysis is not only impracticable but impossible.

This type of system has been found serviceable in small jobbing foundries manufacturing a large number of orders monthly. In such a plant some patterns are used very infrequently. In one case 90% of the orders were for five castings or less per pattern. Formerly, this concern had a special-order system. The detailed work in costing each order separately was great.

Furthermore, the sales department was constantly confronted with this question whenever a customer came in with a new pattern: "Which one of our past orders is similar to the new one?" Usually, no such order was found. Consequently, cost of each new order had to be estimated and it was often more or less worthless because of the frequency of requests for estimates. In a jobbing foundry where few castings are made on an order, it is almost impossible to ever get two costs alike. The concern in question needed a system which would show average cost per pound of certain classes of castings. Such a system was installed. The product was divided into some 16 main classes by weight and into 3 subclasses; no cores, simple cores, and difficult cores—making some 48 classes in all. The installation of a class cost system would not have been necessary if the company had made hundreds of castings from the same order, and if the jobs had lasted for some time. Castings of over 2,000 pounds, however, were still costed on a special-order basis.

After the new system was put in, when a new order was received, it was determined into which class it belonged; then past costs of that class were very useful in estimating the cost of the new order and in establishing a selling price. Furthermore, the class costs enabled the management to decide on the profitable classes to make and sell.

Class costs may be satisfactorily used also in the plating department; the cost basis being either units produced, square inches plated, or pounds plated.

One feature which sometimes can be used in conjunction with the class cost system is the **factor-unit basis.** This basis is established for the different sizes of product, and product is classified according to the complexity or difficulty in handling each class. For example, it is said that this product is twice as difficult to make as this one and so on.

Under the class cost system, **time tickets** may be turned in for both order numbers and class numbers. If class costs show any large variations, order costs can be compiled and analyzed to discover causes of variations within a given class.

OPERATION TYPE.—Under this type, direct labor, or labor and burden are combined and divided by a common unit of production for one particular operation, or a group of operations.

This type is common but could be used more frequently. It should not be confused, however, with keeping of operation costs in connection with special-order cost, where operation costs are simply a further analysis of order costs.

In the operation system there are no order or shop numbers so far as costs are concerned. All labor is charged directly to an operation because the product is usually mixed up as to orders.

The operation cost, for example, may be used in a rubber tire factory. Of course, in making or building tires, each size is costed by itself, but other operations are costed on an operation basis; e.g., the mixing of various compounds is done on the cost basis of the number of pounds mixed; the fabrics and rubber going through the calender are divided by the number of linear yards calendered; the curing cost per tire cured is determined; etc. There may be two groups of **operation costs:** (1) for cord tires, and (2) for fabric tires. **Other operations,** such as trimming the tread and bead rinds, are costed on a unit tire basis. It is necessary in an operation system to have good production records, so production at end of each operation may be known. The costs per unit of operations in manufacturing a tire are shown separately and added up to get total cost.

Material costs are obtained from specifications. A practical assumption made is that all tires finished in one month were made at that month's

FORM 10. Production and Cost Record

operation costs. This is not always true because of the lap-over of a few days between months, but the law of averages should work out. The quantity of each size made multiplied by total cost per tire gives the figure for crediting work in process and charging finished stock. The tire cost, which is built up as a summary of operation unit costs, is sometimes called **synthetic cost.**

After an operation cost system has been operated for a while, **standard costs** may be established and credited to work in process. Standards need be changed only periodically, perhaps every 3 months.

Defective work becomes part of burden and is credited to work in process. If this is impossible, standard waste percentages for each operation may be used.

The operation system, therefore, is used where specific orders lose their identity and where it is practical to keep costs for certain operations by common units.

A **production and cost record** serviceable in connection with an operation cost system appears in Form 10.

PROCESS TYPE.—The process system is used where all three elements of cost can be divided by some common unit of measurement, pound, foot, piece, etc. Under the process type of cost system we do not simply get a process cost per pound or gallon, etc., but we have an analysis of cost by major operations, material cost per basic unit, etc. Under this type one should watch changes in work in process, and consider the beginning and ending inventory in getting current month's cost.

Chemical plants often use the process type of system to advantage. In some chemical plants, all departments are costed on process basis, which does not usually hold in other lines of business.

Foundries use the process cost up to the pouring of metal in molds. The galvanizing department may use the process type.

Plating departments rarely are on a process basis, but where all products are nearly enough alike so that they consume about the same amount of material, labor, and burden per certain unit, such as square inches, the process system can be used advantageously.

Other industries using the process system are: Coal mining, ice, stone quarries, and paper concerns which make one type of product, such as heavy wrapping paper, and others.

Advantages of Cost Accounting

BASIS OF MANAGEMENT.—Probably the greatest advantage of a cost system is that it makes for more effective control and co-ordination of a business than any other mechanism of management. Cost accounting is not an end in itself. It is a diagnosis of business ills, not a cure for them. The management should supply the cure after proper diagnosis.

By setting up standards of performance and standard and budget costs for men, machines, and materials, and comparing actual performances and costs with these standards, a definite conception of the efficiency of the factors in production, distribution, and administration is secured. Remedial measures can then be instituted to eliminate or reduce waste and to control and co-ordinate the business more effectively. **Control** and **co-ordination** are words used more and more by cost men and managers. They are as vital in management as the words "debit" and "credit" in accounting.

Equipped with cost data, managers are in position to formulate business

policies with intelligence and with assurance which comes from the possession of experience data. With these facts budgets can be prepared; labor troubles can be more intelligently discussed with greater probability of an equitable settlement for all parties concerned; wastes of various kinds can be eliminated or reduced; and business conditions can be forecast better; etc.

After business policies are formulated on the basis of facts, there is greater probability that the policies will be carried out, because cost systems provide information with which to realize the day-by-day control of the business.

COST MANAGEMENT.—Cost systems foster the increasing use of scientific method, so called, in business pursuits. Industry is rapidly adopting a new type of management—**cost management.** This is management based upon facts—the facts resulting from use of a cost system. In industry several **types of management** have emerged: the military, Taylor or functional, Emerson or staff, committee, departmental, and divisional. Advocates of these types have not laid as much stress on the absolute necessity of adequate industrial facts, as have those who believe that cost management is growing.

Only by use of cost records can the multiple activities of modern business conducted under the factory system—which has supplanted earlier systems of industry, such as the family, handicraft, and domestic—be thoroughly visualized and proper policies formulated and carried out. Formerly the need for cost systems was not so imperative, because owners, who were also managers, were intimately in touch with details. This condition is not now common. Modern managers, directing the policy and operation of large businesses, must rely on records in visualizing the conduct of the business, so as to exercise intelligent control.

UNIT COSTS.—These records must be planned to show accurate **unit costs,** which, however, are not 100% accurate, because it is impossible to measure with exactness the incidence of certain burden items. Total costs alone do not satisfy managers; neither do average costs in many instances.

By keeping unit costs, profitable and non-profitable lines are clearly recognized. Thus the management can choose the kind of goods to push. Unprofitable lines need not always be abandoned. They may be continued:

1. For sake of their advertising value.
2. For purpose of completing a line.
3. For maintaining production in slack seasons because of organization and equipment which are expensive, due to fact that part of overhead is fixed and continues despite of changes in production volume.

Overhead formerly charged to a product no longer made must be borne by the products still being manufactured. If production of remaining units is increased sufficiently, thus taking up the "slack," higher unit costs do not result. The main effort is to increase sales of the paying product.

DETERMINING SELLING PRICES.—The advantage of cost systems as aids in establishing selling prices has been overemphasized. It holds true when a concern works on a **cost-plus contract,** when it has a **monopoly,** and when its product is highly specialized, as in case of a number of jobbing industries, and so considerably different from products of other concerns. But even industries manufacturing standard competitive lines of products must have definite bases for determining original selling prices of these products. Some selling prices are established by "charging what the traffic will bear"; but usually they are set by competition. Selling prices frequently determine costs. Thus in **packing concerns** and **chemical plants,** costs of

major, joint, and by-products are distributed in many cases over these products according to respective sales (market) prices of these products.

Instead of saying that one function of a cost system is to enable a concern to establish intelligent selling prices, it is better to say that it aids in establishing the **lower limit,** below which there is no profit on sales, called the **point of profit** or **stop-loss point.**

Too frequently, in determining selling prices, volume is disregarded by managers who do not consider that there are certain fixed expenses which do not fluctuate, whether volume is great or small; consequently, the higher the volume of sales is above this line of fixed expenses, the greater the chances are for making money.

The basic theory that might be advanced, then, is that the manufacturer should try to obtain, at least, such a volume of business as would pay the fixed expense of operating his plant, and also the variable expense which rises in proportion to the volume of production. Expressed in other words, each concern has what is known as its "point of profit" or the sales volume needed to operate without loss and from which profits commence to accrue.

It has been conceded by some authorities that a manufacturer should make the major part of his profits on the "effort of manufacture." The more effort one particular product requires over another, the more profit that particular article should bring. The whole theory of manufacture is to purchase material and then apply labor and the expense of co-ordinating labor and material (which is burden), in such a manner as to bring about a profit. This theory means effort. The manufacturer who adopts this theory does not consider so much the buying and selling of the raw materials as he does the effort put on the materials.[4]

NORMAL PRODUCTION.—Many firms vary production with changes in sales conditions by increasing production as sales increase, and vice versa. In periods of depression, equipment and labor may be idle, with the result that unit costs increase. In many cases it is better to cut selling prices slightly rather than to "hold the market," because the plant could then run more normally, and turn out product that could absorb "fixed" overhead, which otherwise would be dead loss. Production, therefore, should be as normal as possible. It is helped by standardized equipment, which depends on close correlation between operating departments, so that all may operate as uniformly as possible. Normal production is also helped by standardization of labor, which materially decreases labor turnover. **Scientific management** aims to bring about a **standardization of labor** approximating in degree the standardization of equipment accomplished largely through the interchangeability of parts for machines.

OTHER ADVANTAGES.—Other departments than sales—particularly production and financial—are helped by a cost system. With a system of

---

[4] See Official Publication, Vol. IV, No. 9, of the National Association of Cost Accountants, "Prices, Profits and Production," by A. F. Stock and M. B. Gordon. This article contains a "point of profit" chart bringing out the application of the ideas explained in the foregoing quotations. The same kind of chart appears in an article, "Finding the 'Stop Loss Price Point,'" by H. R. Boston, published in *Industrial Management*, Nov. 1921.

A method of "profit addition" somewhat similar to the "effort of manufacture" basis referred to above is explained in the uniform cost system adopted jointly by the Label Manufacturers' National Association, the Folding Box Manufacturers' National Association and the National Association of Employing Lithographers. This method is "based on the difference between the manufacturing effort turnover and the material turnover, a certain percentage being added to the manufacturing effort value and a variable per cent being added to the material value, depending upon the rate of material turnover."

cost records and also a system of production control, costs may be reduced, which is important today, owing to keenness of competition. It can be determined with the use of cost records whether it is more economical to make or buy certain goods, and which methods of manufacture are more economical.

If **budget costs** and **standard costs** are calculated, a firm can work out an intelligent financial plan, knowing what expenditures will have to be made and the possible receipts to be expected from various sources. Fixed capital and working capital needs can be determined, and steps taken to procure necessary funds needed to operate the business successfully, without tying up too much capital in inventories.

Another advantage of a cost system is that it enables monthly financial statements to be prepared because perpetual inventories (stock records) for raw materials, supplies, work in process, and finished goods are kept. If stock records were not maintained, it would be necessary to take a physical inventory before the statements could be drawn up.

With accurate profit and loss statements it is possible to make comparisons for different periods of costs and profits on the whole business and the subdivisions thereof, such as operating, selling, and administrative departments, and for processes, jobs, and lines of product, etc. Furthermore, with detailed cost data a basis is provided for comparison of total cost and the various elements of cost with past costs of similar units, with estimated or predetermined costs of the same unit, and subsequently with cost of similar units. To make cost data valuable for comparisons as between different periods, it is often necessary to keep the details in terms of units of material and labor as well as in monetary terms. By comparing balance sheets as well as profit and loss statements, changes in assets, liabilities, and capital can be ascertained.

Workers benefit directly and indirectly from better cost methods. Costs are reduced and wages either remain the same or are increased. By keeping performance records of workers, promotions in rank, wages, and salaries may be made on a fairer basis than if such records do not exist. If costs are reduced, selling prices can be reduced, which means that workers can buy more with their dollars. **Employers** are benefited through cost reduction. They are able to visualize the conduct of a business through cost records. They must have these because they cannot keep in touch personally with conditions as formerly when contact between employer and workers was more intimate.

The public pays for excessive costs which result from unnecessary waste in operations and from labor troubles. Many of these industrial ills are ameliorated, if not eliminated, if costs are better recorded and made public.[5]

Cost Reports and Managerial Uses of Costs

EXPENSE AND BURDEN STATEMENTS.—The final steps in cost accounting are the preparation of cost reports and financial statements, such as expense and burden statements, cost sheets, cost of sales analysis, monthly report of sales, inventory statements, balance sheets, and profit and loss statements. The two financial statements will not be discussed in this section.

One of the most important sets of cost reports are expense and burden statements, in which indirect costs are entered.

---

[5] See publication of the National Association of Cost Accountants, "Radio Educational Campaign," for material on "What Cost Accounting Means to Industry," "Advantages of Cost Accounting to Workers, Employers and the Public," prepared by J. P. Jordan.

Indirect costs are of two classes:

1. Expenses, which after collection are distributed to other expense accounts or to burden accounts. Some examples of these expenses, for which statements are drawn up, are steam, compressed air, power, trucking, and cost department expense.
2. Burdens, which are the final collection of all indirect costs of each direct or productive department. Burden statements show the detailed burden and, of course, burden appears on cost sheets likewise.

Before expense and burden statements can be prepared, a **code of standing orders** must be prepared which can be done intelligently only after the concern has been departmentalized. These are often gotten up in booklet form.

A **controlling account** for each expense and burden account must be opened in the general ledger. Debits to these controls are made from journal entries. All expense accounts are cleared monthly into the burden (debit) accounts. The **burden control accounts** should never be credited during the year except for correction, the credits for burden applied at predetermined or standard rates being made to a parallel **"Burden Credit" account.** These parallel accounts are opened in order to allow the burden accounts, both debit and credit, to accumulate, thereby giving a control for burden statement purposes which otherwise would be impossible. (See also discussion of burden or overhead in this section.)

In general, all expense and burden statements include **three main features:**

1. A section showing details of all charges to the account.
2. A section showing disposition of the cost:
   (a) In the case of expense accounts, this is a complete distribution to other expense accounts and to burden accounts.
   (b) In the case of burdens, this is the amount applied to costs at standard rates.
3. A section showing comparative unit and average costs.

A sample form of expense statement appears in Form 11. A sample form of burden statement may be found on page 615.

FOREMEN AND COST DATA.—Practically every progressive manager and cost man believes that department heads and foremen should be furnished with certain cost data, but considerable difference of opinion exists as to how much cost data they should get. A great amount of educational work in cost methods among foremen remains to be done, however, before they will extract the most out of cost figures submitted to them.

When foremen receive cost figures, they are likely to regard themselves as managers in the true sense of the word, and consequently will manage better than if no cost data were furnished them.

The point has been advanced that the tendency to take away some of the duties which foremen formerly had under the military type of management has possibly been carried to an extreme; and that foremen ought to have much to say about the planning of work and the control of production in their departments. Prior to the days of F. W. Taylor, the pioneer in scientific management, the foreman had too many duties and was "Jack of all trades and master of none." Taylor, his followers, and other industrial engineers have advocated a rather distinct separation of planning and performance, and the carrying out of this separation has resulted in the foreman being relieved of many of his former duties. Today, some feel that this development has been carried too far.

It may, nevertheless, be reiterated that foremen should get certain cost

Holden Manufacturing Company
Trucking Expense, June, 19—

	Jan. 1 to June 30, 19—	Month June, 19—	Month of May, 19—
Trucking Expense:			
G-101 Electric Truck Labor	$ 2,090.54	$ 323.36	$ 365.90
102 Maint. of or Supplies for Electric Trucks	3,010.50	123.94	503.34
103 Gasoline Truck Labor	1,477.24	136.49	285.64

4	5.60	85.14
5		
6	2.59	39.38
7	3.88	58.99
8	.38	5.78
		$1,520.38

Form 11. Expense Statement

data. But it must be properly assembled and of such a nature that they can readily interpret and use it. Order cost sheets are of little or no value to foremen because they get them too late to control costs. Furthermore, even if foremen get them promptly, they are usually too many to analyze.

Then again, the man in the shop likes to refer to production in total or to measure it with some sort of standard and not by different order numbers, even though there may be specific orders for different customers.

But order costs are of value to foremen if they are grouped by classes of product, by major operations, and by units of product, such as foot, piece, etc.

Most concerns do not give foremen direct costs, but many supply them with burden statements. There seems, however, to be no adequate reason why foremen should not get direct costs, since they are in a position to reduce not only these costs but also indirect costs.

Most of the trouble with special order cost systems occurs in getting foremen to use direct costs because there is no common unit which applies to all

orders. This is particularly true in all jobbing industries which often have poor standards, if indeed they have any standards at all. But even in these industries the cost of the order and the production per hour expected are estimated. Any deviations from these estimates can be observed while work is in process. These estimates are not standards but serve as quasi-standards.

In other industries where good standards exist, the foremen should watch the actual performances and compare them with standards, daily if possible, and if not so often, then weekly or monthly.

Some concerns take the attitude that if foremen get cost figures, the figures will leak out to someone outside the plant. Even if they do, they are not of much use to other firms, many conditions in which differ from those in the plant where the figures were compiled.

DEPARTMENTAL BURDEN STATEMENTS.—Each head of a direct or productive department should get each month a copy of the burden statement for his department. (See p. 615 for a copy of such a statement.)

The burden statements which foremen get should show the itemized burden, the **total burden,** including all apportioned or proportioned charges, such as light, heat, and power, trucking, depreciation, general expense, etc. Some cost accountants show the total burden which foremen can control, as a separate figure from the apportioned expenses, which some say are uncontrollable. Others take the position that practically all burden can be controlled to a certain extent. Foremen should be told why and on what basis the apportioned expenses are charged to their departments.

Each foreman should also get a statement showing him the comparison of his monthly burdens for 6 months. Such a statement has the following columnar arrangement: standing order numbers; name of account; average burden for previous 6 months; the amount of the current burden for the month for each standing order; the per cent which this burden bears to the burden basis, whether direct-labor hours, machine hours, or direct-labor cost; and the average per cent from the beginning of the 6 months' period for each item. Percentages which are higher than the figure for the same item for the previous month are entered in red; the other percentages in black. It is the percentages on this report which are significant since the burden may increase and still indicate a satisfactory condition because of the increased volume of business done. Many economies may be effected by a close study of monthly burden statements and comparative burden statements.

WATCHING DIRECT COST.—The number of direct-labor hours, the number of indirect-labor hours, the amount of burden, the ratio of burden to the burden basis, whether direct-labor hours, direct-labor cost, or machine hours, are statistical data always of interest to the management.

Keeping track of the direct cost is different from keeping track of the indirect cost. To determine how the direct cost is best watched, depends very largely on whether or not the manufacturing plant is running under a method of production control.

When a method of production control is followed and the various direct operations are carefully scheduled at standard rates, the natural way of controlling the direct operations is to keep in constant touch with performances as shown by the control methods. Each operation on each piece, whatever the line of industry, should be subject to some **approved standard of speed**—a certain number of pieces per hour or per day, as may be best.

With this method it is necessary—and fair enough—to wait until an order is completed before knowing exactly how that order is running in comparison to the speed estimated for it, on the basis of past experience. The superin-

tendents and foremen should, however, be given the advantage of seeing the actual cost sheets on each completed order, so that they may note exactly how successful their department has been in producing the work assigned. Even without being able to watch the progress of the work as it goes on, there is a psychological effect produced by looking at the completed cost sheet, whereon the final result is shown as a result of the actual circumstances which prevailed during the run.

In any business doing a large amount of rapid work, the **detailed cost of each run** should be entered on a comparative cost sheet. This comparison will show, side by side, the unit time and cost for each operation, and for each period where this particular unit has been in use. Fluctuations in direct cost are the net result of different workers who may run the same machine or perform the same operation. A very careful study should be made of the resulting cost as shown on the comparative sheet. Many times this comparison will bring out possibilities of eliminating the more serious fluctuations—and perhaps reducing time and cost—through careful examination and revision of operating methods.

LABOR COST INFORMATION.—Not only should foremen get burden statements, but statistics showing the amount of the direct-labor pay-roll and the amount of the indirect-labor pay-roll should likewise be placed in their hands.

Comparative labor costs on special orders are not of much value unless grouped by classes of product. When so grouped, the management can ascertain whether they are out of line with past and expected performances.

Other labor cost information of great value to the management is: monthly reports of direct- and indirect-labor costs by departments; the cost of indirect labor in each office department; relationship of indirect labor to total burden; the average rate per hour for indirect labor; the average rate per hour for direct labor; and the percentage of the total burden to the drect-labor cost.

Labor cost information is not only serviceable in normal times but also in periods of business depression. In the latter case, owing to the usual practice to discharge some of the direct workers, the ratio of the indirect labor to the direct labor rises. By having labor cost data, an intelligent reduction in the number of indirect as well as direct workers can be effected by comparing workers' actual performances with standard performances, and by studying over a considerable period the records of their production and their conduct generally. Workers' excuses to do work within the allowed or standard time are noted on their records and their future performances are studied in the light of their excuses. These excuses may reveal conditions, such as machines or fixtures out of order, which otherwise would never be discovered. Workers not reaching the standards consistently are given three warnings in some plants before they are discharged. Workers whose records indicate high efficiency are shifted to other jobs and tried out in many ways with a view of promoting them to foremanships. Performance records of workers are also studied to decide whether a man's request for an increase in wages is justified.

If labor statistics are properly used, the practice of penalizing jobs by charging as indirect labor, excessive direct time consumed on jobs will be checked.

In the case of the lost time of workers, the foreman must explain to the proper official the necessity of reporting lost time. Such procedure prevents the compilation of erroneous cost information and exaggerated labor costs against any particular job. It is also of material assistance in checking the effectiveness of schedules as prepared by the scheduling department.

MATERIAL COSTS.—Foremen should also get direct-material costs. While they cannot control **material prices,** they do have a large part in controlling the **use of material.** Excessive uses of material are detected by comparing consumption with material specifications or bills of material which show standards.

Among the most frequent reasons for diverging from the standard cost of material are:

1. Inability to secure the standard material.
2. Increase in cost of the standard material.
3. Large spoilage of material.
4. Waste on account of using wrong size of material.

It often occurs in making some product that too expensive material of a given size is used. This may be the fault of the operating department which has chosen the wrong material, or it may be the fault of general business conditions, which make it impossible to obtain the right kind of material. In either event, the foreman should know exactly what has happened, so that in the future he can choose more wisely, if the fault is his own, or can see that the purchasing department supplies him with the proper kind of material.

As for all the other faults—spoiling, etc.—it is entirely the duty of the foreman to eliminate to the greatest possible extent such causes as tend to increase the cost of the product in his department. It should be evident, however, that no foreman can properly or intelligently act in the best manner unless he is thoroughly posted in respect to what is taking place. For this reason, superintendents and foremen should be given constant access to the cost records in order that they may be fully posted concerning all that happens.

COST SHEETS.—The summarizing records for the total cost of the product made are the cost sheets. (See pp. 630, 631 for sample cost sheets.) Direct material, direct labor, and burden are entered on these sheets; sometimes, also, the **selling and administrative expenses,** which, when added to the factory cost, give total cost; and sometimes the **profit** on the product, thus arriving at the selling price of the product. Total cost divided by units of product made gives the unit cost, which is more significant to the management than total costs.

The value of cost sheets to the management, however, has been greatly overexaggerated. As stated before in this section, order costs are of little value because they are received too late to control costs, but are of some value if grouped by classes of product, by major operations, and by units of product.

COST OF SALES ANALYSIS.—Another valuable report for executives is the "cost of sales analysis" prepared monthly. This shows the monthly cost of goods shipped and billed. In order that this analysis may be prepared, a duplicate of every invoice is forwarded to the cost department. The analysis should be kept according to classes of product. It is possible, then, to determine the average percentage of profit by classes of goods, which is of great value to executives. Standard costs are often shown in this report and compared with the actual.

A real difficulty arises in preparing this record where **partial shipments** have been made on orders.

This situation may be handled in three ways:

First.—Separate costs can be worked out for each operation as far as it has been performed and so an actual cost on the partial shipment can be built up. This is accurate but impracticable because of the detail involved.

Second.—The billing price can be taken as the cost. This means that no profit will be shown in the Profit and Loss account until final shipment is made, when the entire profit on the job will develop. This is the conservative method, but many companies do not wish to postpone the profit showing so long.

Third.—The estimated cost can be taken as the actual cost, possibly adding 3% or 5% as a factor of safety. This would mean, then, that the estimated profit, less any percentage as a factor of safety, would be shown on the partial shipment.

When the job is actually completed an adjustment will be made on subsequent bills to cover any difference between the actual and estimated costs on the partial shipments. If the estimated procedure is on an accurate basis, this method works out very satisfactorily.[6]

See also discussion of types of cost systems (p. 628) for further material on the costing of partial shipments.

COST OF GOODS RETURNED.—Some concerns also prepare monthly a statement of the cost of goods returned.

MONTHLY REPORT OF SALES.—If the cost of sales analysis shows only costs and not sales prices, a monthly report of sales should be prepared. A serviceable form of this report follows: Item, this month; estimated this month; per cent increase or decrease, last month; per cent increase or decrease, to date this year; estimated to date this year; per cent increase or decrease, to date last year; per cent increase or decrease.

It will be noted that this form provides for estimated or budget figures as well as actual. The management by studying this record can effect a better control of sales than if without the record.

INVENTORY STATEMENT.—Foremen should also be kept informed as to the status of inventories as reflected on the balance sheet. An inventory statement may be prepared monthly which shows the control accounts for the inventory: raw materials, supplies, work in process, and finished goods; figures for the current month, the last month, the year to date, and the corresponding month last year being entered on the statement. These inventories are scrutinized by the management to see if the values stated are too high or too low. If the manager wants more information, he can refer to the stock cards which contain the details which appear in total in the inventory control accounts.

A **form of inventory statement** which can be used where a concern has a system of budgetary control is as follows: Item, inventory, estimated inventory, per cent increase or decrease, shipments, estimated shipments, per cent increase or decrease, turnover this quarter, turnover same quarter last year.

ADDITIONS TO PLANT CONTROL ACCOUNTS.—Another monthly statement of value to the management is one which shows the additions to the plant control accounts according to the classification of equipment and the department to which the additions are made. These represent the fixed assets. The supporting details are recorded on the plant ledger explained on p. 611. By a close watch over proposed expenditures for plant and equipment, large sums of money are saved, because it may be discovered that some of the proposed additions to plant and equipment are not vitally necessary to successful manufacturing.

SECTION 14

AUDITS AND WORKING PAPERS

CONTENTS

SECTION 14

AUDITS AND WORKING PAPERS

GENERAL.—The purpose of this section is to give an outline of procedure to be followed in the audit of the average business concern. Every business has some special points, every organization and every system their peculiarities. The auditor must have sufficient training and judgment to determine what should or should not be done in each audit. Principles involved in the application of accounting theory to problems presented in an audit are discussed in treatises on auditing.

DEFINITIONS.—An audit is an examination of the financial transactions of a business based to a large extent on the books, made, as a rule, to secure information necessary in the preparation of statements of financial position of the concern and of results of operations.

The classes of audits are:

- Balance sheet audits
- Detailed audits
- Cash audits
- Continuous audits
- Completed audits

A **balance sheet audit** is the verification of assets and liabilities and such an analysis of the income account as enables the auditor to certify that it has been properly stated.

A **detailed audit** differs from a balance sheet audit in that the transactions during a fiscal year must all be verified. The verification consists largely of review and tests; none the less, the tests should be made so that the general accuracy of transactions of the entire period under review will be determined.[1]

The **cash audit** covers a verification of the cash balance on hand at end of period and of cash receipts and disbursements for period in question.

Continuous audit is the designation given to examinations made monthly or at other regular intervals with the thought that through such examinations transactions of an entire period will be examined ultimately.

The expression **completed audit** is applied to an examination where a report is submitted after making an audit covering an entire period.

Preparation for the Audit

PRELIMINARY CONSIDERATIONS.—The audit of a concern begins when the auditor receives his first notification that an examination of the accounts will be made. Before commencing work familiarize yourself with

[1] See R. H. Montgomery, Auditing, Theory and Practice, Vol. I, p. 491.

the peculiar features of client's business; also make arrangements for the preparation by client's employees of certain data for use in the audit.

DATA RELATIVE TO INDUSTRY.—The auditor's report cannot be prepared intelligently unless he has some knowledge of the business in question and of current business conditions affecting the industry. As he cannot be expected to be conversant with data of this nature for all industries, he must in some cases collect information. Whenever possible this should be done before commencing the audit.

Data to be collected may be classified as follows:

1. Special conditions in the industry relative to prices, markets, labor rates, and foreign conditions. This information may usually be found in the trade papers covering the industry in question, or in commercial publications covering industries in general.
2. Special features in connection with finances, management, or accounts of the business in question.[2]
3. Uniform statements of operations or systems of cost accounting, published as a rule by an association representing a group of concerns in the industry, and in some cases by departments of the federal government or research associations.

STATEMENTS TO BE PREPARED BY CLIENT'S EMPLOYEES.—Considerable time can be saved by arranging in advance for client's employees to prepare certain statements, schedules, copies of documents, etc. Client's employees are as a rule very busy during the audit, which generally begins shortly after close of period under review. If request is made for certain statements during the audit or a few days before its completion, it is likely that the data cannot be compiled in time or that it will be furnished at the last moment and will delay completion of the audit. It is therefore advisable, where arrangements are made in advance, to request at that time that employees prepare certain statements, schedules, etc., for the audit.

The following list comprises some of the statements, schedules, etc., which employees of the client may be asked to prepare to facilitate the work and to permit the auditor to spend time on more important work.

List of bank balances (if there are many bank accounts).
List of cash funds.
List of cash items in transit.
List of notes receivable on hand (where not too numerous).
List of notes receivable out of office.
List of notes receivable discounted.
List of investments, including mortgages receivable.
List of special deposits made.
List of employees' accounts receivable (where not too numerous).
List of additions to plant during the period (if the items are very numerous, then a list of all items over a certain amount).
Statements of additions to and deductions from depreciation reserves during the period.
Schedules of prepaid insurance, interest, taxes, and other prepaid expenses.
Schedules of deferred charges such as bond discount, organization expenses, etc.
List of notes payable.

---

[2] Montgomery's Auditing, Vol. II, and Kester's Accounting, Theory and Practice, Vol. III, give information of this nature for certain industries.

List of mortgages payable.
Schedule of accrued interest, taxes, wages, or other accruals.
List of special deposits held.
Schedule of purchase commitments.
Schedule of sales contracts.
Schedule of insurance carried.

While this number of statements is formidable, not all will be found necessary in any one audit and the items in each statement for one audit will not be numerous. Many of these statements may be simply copies of parts of certain records which can be prepared by typists with little assistance from the bookkeeper.

INFORMATION RELATIVE TO CLIENT'S ORGANIZATION.—Without violating any rules of professional ethics, obtain as much information as possible relative to client's organization before commencing the audit. Obtain names of principal officers and of directors who are especially active, as well as any special ideas relative to operation of the business which these individuals possess.

Upon arrival at client's office examine a copy of the organization chart and make notations of those departments or individuals with whom you will have close contact. In some cases there may be friction between certain executives of apparently equal rank. If you become cognizant of this in the early stages of the audit, you will be less likely to do anything which may antagonize such persons.

Endeavor during first days of the audit to ascertain the relationship between executives or employees and officers and directors of the concern under audit, with a view to determining extent of the authority vested in each.

DATA RELATIVE TO SYSTEM OF INTERNAL CHECK.—Before commencing any part of the work, familiarize yourself with the system of internal check. This expression is well explained in the following quotation:

> Such a system consists in the accounting records, methods, and details generally of an establishment being so laid out that no part of the account or procedure is under the absolute and independent control of any one person; that, on the contrary, the work of one employee is complementary to that of another; and that a continuous audit is made of the details of the business.[3]

Determine the extent to which any record will be examined only after making inquiries as to adequacy of the internal check. Make the examination in such manner that it will bring out any shortcomings in the system of internal check. For instance, as to **cash receipts**, ascertain:

1. Nature of receipts.
2. Who receives cash.
3. In what form it is received.
4. First record made of cash.
5. Who next handles cash.
6. Entries made to record its deposit.
7. Whether the day's receipts are deposited intact.

As to **disbursements by check** the auditor should make inquiries concerning:

1. Authorization to disburse.
2. Preparation of checks.
3. Signing of checks.

[3] Montgomery's Auditing, Theory and Practice, Vol. I, p. 62.

4. Mailing of checks.
5. Recording of disbursements.
6. Number of persons handling disbursements.

And as to **disbursements** in currency:

1. Whether on imprest system.
2. Number of persons handling.
3. Method of replenishing funds.
4. Authorization for replenishment and extent of examination of vouchers at that time.

Trace each movement of merchandise and supplies from time when they are ordered until their receipt, storage, and subsequent shipment or consumption. Investigate the records prepared in connection with payment for merchandise or supplies.

Ascertain whether work is so divided that the same person does not prepare pay-rolls and also prepare pay envelopes and make the payments, and whether there is an independent check by someone who has no other connection with the work.

Give same consideration to other parts of the work, such as accounts receivable, handling of income from investments, recording of additions to plant, depreciation, etc.

Bear in mind that fitness of employees for the respective positions and their general attitude towards their work have an important bearing on the efficacy of any system of internal check. Personal relationships between employees also have an important bearing on value of such a system. Note any relationship which may cause employees to be lax or partial and make allowance for such tendencies.

Planning the Audit

ADVANCE CONSIDERATIONS.—While the fact that a report will be prepared is not the principal reason for making an audit, in many cases the result of the audit in great measure depends on the impression the report makes on the client. Start preparation of your report as soon as you commence the audit.

When the client or an executive of the concern is interviewed before beginning the work, certain impressions may be obtained of the type of report which will make the desired appeal or of data which should be included or excluded from the report. It is helpful, when the report is being written, if notes of this nature and others have been collected in the course of the audit so that reference can be made to them.

Much time is wasted in some audits by preparing schedules or other data which appear interesting but have no value for report purposes. It may be advisable simply to note that consideration should be given to the inclusion of such data in the report and to defer actual preparation of material until audit is completed.

If **report of previous audit** is available examine it as early as possible. Make memoranda of items to be considered and of special statements or references which may be of assistance. Consider general arrangement of the report and subject matter reference to material which may be included in or omitted from the report to be prepared. The fact that comment has been made on certain facts in the last report may tend to minimize the value of similar comments in the next report. In addition, aim to prepare your report, so far as possible, in a form different from that of the preceding.

AUDIT PROGRAM.—An audit program is an outline of work which is to be done. It has its greatest value in continuous and in periodical audits, especially where much work can be entrusted to assistants.

Audit programs are usually prepared by the principal after inspecting the records to be examined. They should be prepared preferably as a whole rather than in sections, as it is then possible to determine whether the program is well balanced.

Sometimes the time allowed for the audit is limited and the auditor may use his discretion as to extent of work to be done. In such cases a flexible program should be prepared and notations be made which will permit increasing or decreasing of the work covered by certain sections of the program according to amount of time available.

Prepare the program **in sufficient detail.** Thus if there are three bank accounts, it should be arranged so that work for each account will be shown. It will then be possible to note on the program work completed on each account, so that status of the entire audit may be readily ascertained from the audit program.

Directions given in program should be clear and specific. There is always the possibility that some other person than he who prepares the outline may have to complete it and therefore interpret the directions. Thus the words "Check the pay-rolls" are susceptible of many interpretations. On the other hand, "Examine authorizations for additions to pay-rolls and for increases in rates," "Verify extensions and footings of pay-rolls for December," "Compare pay-roll totals with cash disbursements," are specific expressions which do not confuse and save time by requiring work to be done in proper order.

As each piece of work is completed make a notation on the program; also where you leave off at close of day or when called away to other work. If this procedure is followed, work may be taken up at that point by another auditor without difficulty.

The audit program, with all amendments and notations made during the audit, should be a **record of actual work done.** Questions often arise as to extent of work done, or it may be necessary to state in the report the extent of some of the work. As a rule it is not possible to answer these questions by referring to the working papers. The information in a complete audit program is often very helpful after the next audit is made. **Legal controversies** may develop and the auditor be required to testify as to extent of work done.

Some auditors of considerable experience do not prepare audit programs. Unless a record is made in working papers in such cases, there is no record of scope of work done in connection with each item covered. There is also the possibility that important items in mind early in the examination will be ultimately overlooked.

If the program of a previous examination is available, do not use it without first considering whether it is adequate to meet present needs of the business as well as the views of the auditor. There may have been changes in the system of internal check or developments in the business which call for revision of parts of the program.

SAMPLE AUDIT PROGRAM.—The program for a balance sheet audit given below should not be applied in toto to any audit. It is presented to indicate what should be included in some outlines. A medium-sized mercantile business, however, might have transactions and accounts similar to those considered in the present case.

Reference to the pamphlet issued by the Federal Reserve Board, entitled "Uniform Accounting: a Tentative Proposal submitted by the Federal Reserve Board, etc.," which contains "general instructions for a balance-sheet audit of a manufacturing or a merchandising concern," will be helpful in the preparation of audit programs.

In this connection consider the following from "Auditing, Theory and Practice," by R. H. Montgomery: "Nothing can be more harmful to students than the exclusive use of condensed rules of procedure; practitioners who rely on programs prepared by others are chargeable with negligence if they permit fixed rules to take the place of independent procedure."

AUDIT PROGRAM

A. B. C. Mercantile Co.

1. Cash on Hand:

Count cash on hand.
Note any unusual items in fund.
Prove totals with records.
Confer with treasurer regarding differences or unusual items in the fund.

2. Bank Balances:

Compare deposits on statement with cash book for last month: First National, Atlantic Trust.
Compare paid checks with cash book for last month—list checks drawn to order of cash, bearer, employees, etc.: First National, Atlantic Trust.
Reconcile bank balance: First National, Atlantic Trust.
Compare total bank balances with cash book.
Confirm bank balances by correspondence: First National, Atlantic Trust.
Examine entries covering old checks outstanding and deposits not recorded by banks.
Compare details of the deposits for the last week with cash book entries.
Examine those paid checks which were outstanding at date of last audit.
Verify footings of cash disbursements for last month.
Compare total deposits on statement with total cash receipts for last month.
Scrutinize cash entries for balance of period and for month following period.

3. Notes Receivable:

Compare notes on hand with record of notes.
Confirm notes out of office by correspondence.
Prove total of open items in record with ledger.
Make list of notes with rates of interest and due dates, or if too numerous, list overdue and special items.
Verify calculations for accrued interest.
Ascertain whether any notes discounted have maturity dates subsequent to close of period; if so, confirm such items by correspondence.
Confirm special notes or notes for large amounts by correspondence with makers.
Trace into books entries for items collected since close of period under review.

4. Accounts Receivable:

Compare balances in ledgers with trial balances, testing accuracy of a few balances.
Verify footings of trial balances.

Note any overdue or unusual items still unpaid, by placing a distinctive mark on trial balance, next to such items.
Ascertain whether balances represent specific items.
Confer with treasurer and credit man regarding overdue and unusual items.
Verify sufficiency of reserve for doubtful accounts, including provision for doubtful notes receivable.
Prepare separate totals for credit balances, items representing deposits made, balances due by officers, employees, affiliated companies, etc.
Check postings for 1 month, or if many accounts, 1 month's postings for a few letters of the alphabet.
Ascertain whether a reserve should be provided for discounts, freights, refunds, etc.
Ascertain whether any accounts have been hypothecated.
Examine entries covering bad debts written off.
Consider advisability of confirming accounts by correspondence.

5. Inventories:

Test extensions by scrutinizing columns for quantities, prices, and amount.
Verify footings of every tenth sheet, or any sheet totaling over $......
Verify transfer of amounts to summary and footings of summary.
Compare prices with those on purchased invoices.
Ascertain from outside sources the present market prices.
Make inquiries relative to obsolete stock, and items for which large quantities are carried.
Compare inventory in sections with previous inventory.
Ascertain whether any portion of stock is hypothecated. If a first audit, scrutinize inventory at beginning of period to determine general accuracy and whether it was prepared on same basis as current inventory. If perpetual inventory records are kept, make tests by comparing portions of physical inventory with corresponding entries in perpetual inventory records.
Where possible, make tests of quantities on hand by actual count.
Test the inventory totals by the "gross profit" method.

6. Investments:

Prepare or have prepared list of investments.
Examine securities, and collateral documents.
Verify income credits.
Compare cost price with present market price.
Compare list with records.
Confirm by correspondence investments not examined.

7. Prepaid Insurance, Interest, etc.:

Examine insurance policies, special contracts, etc., in connection with prepaid items.
Test calculations made, or make calculations for prepaid insurance, interest, etc.
Compare totals with ledger accounts.

8. Furniture and Fixtures:

Examine entries for additions and reductions during period.
Determine whether adequate provision has been made for depreciation.

9. Notes Payable:

Confirm amount outstanding by correspondence, including collateral if any.
Compare total with general ledger account.
Examine paid notes returned during last 3 months.
Verify amount of accrued or prepaid interest.

10. Accounts Payable:

Compare ledger balances with trial balance, noting overdue items.
Compare total with controlling account.

Compare creditors' statements with ledger balances, investigating differences.
Examine purchasing records, receiving records, unentered invoices, and entries subsequent to close of period for additional liabilities.
Prepare separate totals for items representing debit balances, deposits received, amounts due to officers, employees, and affiliated companies, etc.
Investigate purchase commitments, sales orders for future delivery, etc., to ascertain whether there is possibility of loss on such contracts.

11. **Accrued Liabilities:**
Test calculations or make calculations for accrued wages, rent, insurance, interest, taxes, etc. Compare totals with ledger balances.

12. **Capital:**
Examine capital stock records or confirm amount outstanding by correspondence with registrar.
Compare total with general ledger balance.

13. **Surplus:**
Examine changes during period.
Note any large or unusual items.
Obtain authority for changes requiring it.
Prepare summary of surplus changes for report.

14. **Voucher Register:**
Compare vouchers with entries in voucher register for portion of the period, noting nature of charge, special terms, approval, distribution, etc.
Scrutinize voucher register for balance of period, investigating any items not in order.
Verify cross-footings at close of month for a few months.
Ascertain whether method of preparing vouchers is such that client's interests are safeguarded.
Investigate whether all deductions are made before approving vouchers for payment—such as freight on f. o. b. destination shipments, allowances for containers, allowances on special contracts, etc.

15. **Pay-Rolls** (For large audits a short period should be examined):
Verify additions and increases by comparing with original records.
Verify totals of pay-rolls.
Compare amounts of pay-rolls with cash drawn for pay-rolls.
Ascertain how unclaimed wages are handled.
Investigate method of preparing pay-rolls and making payments to determine whether there is a good system of internal check.

16. **Journal:**
Examine entries for 1 or 2 months in detail.
Scrutinize entries for balance of period and investigate any unusual items.

17. **General Ledger:**
Verify trial balance or take off trial balance.
Check postings for 1 month.
Scrutinize ledger accounts, investigating unusual items.

18. **Sales:**
Test prices on a few invoices in last month of period and first month of next period to determine whether prices are being maintained.
Make tests to determine whether all items included in sales immediately preceding close of period were shipped.
Scrutinize return sales items for 1st month of next period to ascertain whether total is unusually high.
Investigate method of making allowances, scrutinize allowances for 1 month, and investigate large items during balance of period.
Investigate method of entering cash sales and handling proceeds.
Verify, or, if many items, test footings of sales record for 1 month.
Verify transfer of monthly sales totals to general ledger.

If possible, prove production figures by using quantities for inventory at beginning of period for production during period for net sales and for inventory at end of period.

19. **Minutes:**

Examine minutes, making notes of any items which require attention, such as dividends declared, salaries authorized, contracts consummated, etc.

20. **General:**

Test sufficiency of fire insurance carried.

See whether all officers and employees are bonded who should be.

If other insurance, such as use and occupancy, burglary, automobile, etc., is not carried, determine whether such insurance is needed in this case.

Investigate method of receiving and delivering merchandise and records prepared therefor.

This program is rather full and detailed, because intended to outline practically all work which may be done in balance sheet audits of small or medium-sized concerns.

Audit in Progress

SELECTING WORK TO RECEIVE FIRST CONSIDERATION.—There is no invariable rule as to order in which auditing work should be taken up. Before doing any part of it, in each engagement, survey it as a whole to determine whether you cannot to advantage vary from the regular procedure. In some cases an examination of leases, special contracts, and even the minutes, may give you an insight into special features of the business which will be of material assistance in every phase of the work—even in the examination of cash. Before starting any work you should, if possible, familiarize yourself with the records and method of making entries therein. Trace several entries through the records to get the connection between the various records. If you can picture in your mind the system of accounts, you can more easily ascertain to what extent there exists a good system of internal check. This information will make possible the determination not only of the work which should receive consideration but the extent of the examination to be made.

AUDITOR'S ATTITUDE TOWARD CLIENT'S EMPLOYEES.—You should be a student of human nature, capable of forming in a short time accurate impressions of the capabilities and peculiarities of persons encountered in your work. Conduct your examination with due regard to its effect upon progress of the regular work of client's staff. Make every effort to interfere as little as possible with the routine work of client's office while at same time conducting the audit in an efficient manner.

It is difficult to make a good audit without the co-operation of client's employees. Much of the work done consists of tests which do not cover the entire period. Therefore, it will probably be found that in many instances discussion with a friendly employee will develop points which may not be disclosed by tests made.

Your attitude towards client's employees should be one of helpfulness. They should look forward to your visits as occasions for discussion and improvement. If the employee is made to feel that he is in a position to impart to you information about his system or his line of business and that you are ever ready to learn, a bond of common interest will be created,

which will not only make the engagement more pleasant but create a desire on the employees' part for periodical examination of the records.

Use tact in bringing errors and differences to the attention of employees. If you request an employee to explain an entry known to be incorrect instead of referring to it as an error, sensitive employees will not be antagonized.

Discussions of accounting systems not operating efficiently should take the form of requests for information relative to operation of the systems. In many cases the first impression that the system is not operating efficiently is not well founded; had the first impression been made known friction might have resulted.

Be dignified but not formal, avoiding familiarity and conduct yourself so that you will receive from the employees the respect to which you are entitled.

EXAMINATION OF VOUCHERS.—The word **voucher** here denotes a purchase or expense invoice which has been examined and approved either for entry in a purchase book or for payment.

It is advisable to defer examination of vouchers until you have had opportunity to gain some knowledge of the organization and office methods and of the peculiarities of the business under examination. If you can secure a knowledge of the business equal to that of the highest accounting officer or clerk who approves the vouchers, conditions will be ideal.

When **detailed audits** are being made, examine practically all vouchers. For other audits examination of those for one or several months may suffice. Make the decision relative to the months to be examined after inspection of records as a whole and consideration of conditions in the particular audit. As a rule vouchers for last month of period will be examined in any case, except in audits of large concerns having effective internal audits. In such cases vouchers for part of a month only may be examined.

After you have examined vouchers for one or more months, scrutinize entries for months not examined. All entries for unusually large amounts or those which do not appear to be in order should be vouched.

Purposes for which vouchers are examined may be of two kinds: minor and major.

The **minor purpose** is to determine that the charge has been made on proper authority and that entry has been correctly made. Following steps should be taken in verification of vouchers for the minor purpose.

Obtain a list of names of those authorized to approve vouchers as to purchasing, receiving, prices, extensions and footings, distribution and payment. If possible, secure actual signatures or initials. Note any approvals missing or not in order. Distribution of voucher should be verified. Then compare voucher with voucher register or purchase book as to name of creditor, amount, and distribution of charge.

The minor purpose also includes verification of footings of various columns of the purchase journal and cross-footings at end of month.

In some audits, notably those of associations or of persons acting in a fiduciary capacity, vouchers should be submitted to auditors for every entry. Auditors should, in such cases, place a distinguishing mark next to those entries for which the vouchers have been produced. If at completion of audit some vouchers have not been produced, missing ones should be reported unless the paid check together with other documents on hand can be accepted as good evidence that the expenditure has been authorized and payment made. However, this may not be acceptable in some fiduciary audits where a receipt must be submitted for every payment.

In commercial audits nature of the purchase or expense is considered and

it is the exception rather than the rule for the auditor to insist on a receipt for the payment.

However, when many vouchers are missing or incomplete, the auditor should have in mind the effect which such items have on the system of internal check. If he suspects that many more such items exist and that this condition has a bad effect and may cause irregularities, he should make further tests. If the tests bear out his suspicions, he should report his conclusions.

The **major purpose** of the examination of vouchers is to determine, as far as can be ascertained from the vouchers, whether client's business is being operated efficiently and economically and every advantage is being taken of opportunities to increase profits and decrease expenses. The auditor should be qualified to judge whether advantage is being taken of every concession to which the client is entitled.

Examine vouchers or invoices critically to ascertain what creditors offer as to discounts, allowances, refunds, etc. Thus invoices may cover shipments made f. o. b. destination and no deductions appear for freight which may have been paid by the client and charged to an expense account upon receipt of goods. Invoice may indicate that special allowances are made if certain quantities are purchased during specified periods. Investigation may show that the quantity has been purchased but the allowance has not been claimed. Refunds may be allowed for containers returned, but it may be found that refunds have not been claimed and containers are going to waste. Cash discounts at nominal rates only may be taken advantage of, while other payments where discounts at substantial rates could be earned are made gross. Numerous purchases may be made in small quantities at a disadvantage both as to price and delivery, when contracts could be closed for larger quantities on better terms. Note other items of like nature and make suggestions for improvements or memoranda for further investigation.

POSTINGS AND FOOTINGS.—Verification of postings and footings is of minor interest in balance sheet audits, especially where there is an internal audit and the postings and footings are verified and tested periodically.

Postings.—Where one clerk takes care of all records, receiving and disbursing the cash, it is advisable to check all postings to general ledger and to make tests of a portion of the postings in other ledgers. If a detailed audit of the accounts of a medium-sized concern is being made, same procedure should be followed. In balance sheet audits postings of the general ledger may be checked for 1 or 2 months and short tests made of those in the subsidiary ledgers. In balance sheet audits of very large concerns no check need be made of postings.

If possible, make verification of postings by checking from ledger to books of original entry. After completing the check of all entries in the ledger, scrutinize books of original entry to make certain that all entries have been checked.

Footings.—It is impractical to set down definite rules as to extent to which footings should be verified. Wherever possible prove totals of any record which has been checked in detail against another record by comparison with totals in the other record. Where there is no system of internal check and a detailed audit is made, verify all totals of cash book and general ledger, at least, and check those of the other records. Where there is a good system of internal check and a balance sheet audit is made, tests of footings of general ledger and cash book should be sufficient.

Place a distinctive mark under or next to each total which has been verified.

VERIFICATION OF TRIAL BALANCES.—Verify the general ledger trial balance by comparison of the balance of each ledger account with the amount appearing in trial balance. Instead of verifying the client's trial balance, many auditors take off their own general ledger trial balance. When client's trial balance is verified the totals should be proved. Unless there is a large number of accounts, verify the trial balances or lists of accounts of subsidiary ledgers. Where number of accounts is large, say 5,000 or more, test by verifying the balances of several sections, and investigate method of controlling and balancing.

ANALYSES OF LEDGER ACCOUNTS.—Make analysis of those ledger accounts which are confused, or where it is necessary to have more detailed information for the report. A transcript of an account is not an analysis. It is generally understood by an analysis that items of a like nature are grouped together, i.e., according to the nature of the transaction (not all journal entries, for instance), and that a summary is prepared giving totals of such items and also that a list of the miscellaneous items is included.

Some audits are partly made by analysis, that is, by taking each ledger account and grouping items of a like nature and then comparing the groups with entries in subsidiary reports.

TESTS AND SCRUTINY.—Where entries are not verified in detail, the audit is made by "tests" and "scrutiny." Montgomery gives the following definition of tests: "To try by subjecting to some experiment, or by examination and comparison; to subject to conditions that disclose the true character of. An examination made for the purpose of proving or disproving some matter in doubt."

Since in many audits it is neither practicable nor advisable to examine entries in detail, the auditor must make some audits through examination of a part of the entries and a scrutiny or inspection of the balance of the entries for the period under review. Any entries in the period so inspected which do not appear to be in order should be subjected to thorough examination.

Working Papers

GENERAL CHARACTER.—Working papers should be a permanent record of the items noted and work completed in course of an audit. Prepare them in such manner that if properly indexed any auditor can readily locate data relative to any part of the audit. Working papers are sometimes used as an aid in giving testimony years after completion of the audit. The **prime requisites** of good working papers are:

1. Heading should clearly state the subject matter.
2. Items noted under each subject should be identified as to their date and source of information.
3. Point at issue or reason for the notation should be set forth specifically.
4. Conclusions arrived at or directions for disposition of the notation are necessary parts of the papers.

CLASSIFICATION.—Working papers generally come under one of the following headings:

1. Notations relative to errors or special items.
2. Schedules and statements, such as lists of prepaid or accrued items.

reconciliations of bank balances, copies of financial or other statements, etc.

3. Correspondence, and extracts from, or copies of records or documents.

NOTATIONS.—It is impossible to overestimate the importance of preparing clear, concise comments which cannot be misunderstood when examined by someone else or even by the writer himself a few days or a few months later.

Considerable time is lost on many audits because it is not possible, when necessary, to locate in records of client the item which is the subject of comment. In other instances the item in question can be located readily in the records but it is not possible to tell why it was listed. Some such comment as "General Expense—Jan. 26—$385.24—Investigate" is made, but an inspection of every record in which this item appears does not furnish reason for the investigation which the auditor has in mind at the time when the notation is made, and the auditor himself at a later date is not able to recall it.

The notations may be divided into the following **principal groups:**

1. Errors.
2. Memoranda for the report.
3. Differences to be investigated.
4. Data prepared as a matter of record or for future audits.
5. Items listed to secure approval of someone in authority.
6. Information listed to prepare adjusting or other entries.

One **basic rule** in connection with notations is thus stated by Montgomery:

> There should be an absolute rule, strictly adhered to, forbidding the writing of more than one class of errors on the same piece of paper. The reason for this is evident. The work covered is assumed to be a test only, and no one can tell how many errors may develop if additional verification is required.

In preparing notes, one side of the paper only should be used, and if possible all sheets should be of one size.

Notations should, wherever possible, be prepared in some definite order. If the auditor makes his notations in the following order, or similar arrangement, he should have no difficulty in preparing notations which will assist materially.

1. Date of entry or transaction.
2. Title or description of item.
3. Amount of item (if amount is in question).
4. Reason it is noted.
5. Correction to be made, if then known.

Carry the **amount** out to the right where it will stand by itself, unless there is reason why it should appear in the body of the notation. This facilitates locating an item where the amount is known.

After each notation, leave at least five lines to provide space not only for further comments which may be made relative to the same item, but to set off each notation.

Place a **distinctive mark** on each notation after it has served its purpose, so that it will be clear that nothing further need be done as to that item.

Word each comment so that it will convey the message intended at the time. It should be the auditor's aim to make notations which are specific, not rambling, disjointed phrases.

Make separate notations of data which might be included in the report.

It is good practice to have special sheets headed "Notes for the Report," on which these items may be inserted.

SCHEDULES.—The word **schedule** in this case designates various lists of accounts, revenue or expense items, extracts from accounts or from subsidiary records, statements covering reconciliations of bank balances, counts of cash, groups of figures, and summaries.

As mentioned elsewhere, there is a tendency on the part of some auditors to prepare many unnecessary schedules. Many statements are highly interesting but not essential to complete the audit or to prepare the report. Other statements should be included but the auditors should arrange for their preparation by client's employees rather than spend time making the required copies.

The **heading** given to a schedule should be so clear that there can be no doubt in the minds of anyone who examines it just what is included therein and what it was intended to exclude therefrom. After giving such a heading to the schedule the auditor should be careful not to include any other extraneous matter unless the heading is properly amended.

Frequently certain information is sought in the working papers but, due to misleading headings, it is impossible to locate the data required without examining practically every sheet.

Arrange data and figures included in a schedule in logical order so that whenever possible data listed will practically form a narrative of transactions involved. While these figures, without this logical arrangement, may lead to the same conclusion, it is likely that the schedule will not in that case be readily understood by those examining it.

Schedules or groups of figures which are part of a schedule are sometimes copied from records or statements. In such cases prove the totals or other calculations in connection with the figures copied independently, using the figures listed. Errors are frequently made in copying figures, to be discovered only when the records from which they were copied are no longer available. Be careful when making such extracts.

EXTRACTS FROM RECORDS OR DOCUMENTS.—Many documents are quite lengthy, in some cases 10 to 20 pages or more. A large portion of such documents may comprise introductory remarks, detailed descriptions, and special clauses having little or no bearing on points to be covered in the audit. The auditor must decide just how much should be taken from each document in order that he may have a record of the substance of the document in as few words as possible.

The **heading of the extract** should be a full description of the document, with date and any other data necessary to distinguish the document in question from similar documents. There may be, for instance, several contracts of the same nature, between the same concerns, made at different times.

If it is found necessary to have copies of whole sections of documents, request the client to have such sections typed for your use. In other cases it may be advisable to have a copy of the document as a whole furnished, or photostatic copies prepared.

DISPOSITION OF WORKING PAPERS.—The proper filing or sorting of working papers during course of the audit facilitates work and minimizes the possibility that you may overlook an important item while completing the audit. Sort papers so that notations of like nature may be kept together. Some auditors, for instance, keep in separate folders papers relating to cash, accounts receivable, inventories, etc. As the notations on various sheets

have served their purpose, they may be inserted in a separate folder marked "Completed" or with some other similar designation. However, make certain that every notation on sheets so transferred has received attention.

Mark each notation which has served its purpose so that anyone may follow developments and know the conclusions reached. Such expressions as "OK," "Adjusted," "Have investigated," are often meaningless and sometimes are the cause of a second investigation. Additional remarks should indicate in as few words as possible what was done and result of the inquiry or investigation. Place **distinctive marks** across notations to indicate that nothing further need be done.

After completion of audit, file working papers in logical order so that any auditor can locate readily any papers required. When filing papers, ascertain whether all headings on the various sheets are clear. There are many plans for **indexing** working papers, which are sufficiently comprehensive for papers of the average audit. The following index is useful for working papers of a small audit:

A – Cash
B – Notes Receivable
C – Accounts Receivable
D – Inventories
E – Prepaid and Deferred Expenses
F – Investments
G – Plant and Equipment and Reserves
H – Miscellaneous Assets
I – Notes Payable
J – Accounts Payable
K – Accrued Liabilities
L – Reserves
M – Miscellaneous Liabilities
N – Capital Stock
O – Surplus
P – Profit and Loss Items
Q – Miscellaneous Notes
R – (For additional headings)
S – " " "

The letters given above should be written on the lower left-hand corner of sheet or in some other prominent place, and the series of sheets for each of the above captions should be numbered from 1 up; i.e., three sheets for cash call for A1-3 and five sheets for accounts receivable, C1-5, etc.

Bind the sheets securely or place them in an envelope. On cover or on outside of envelope insert name of client, date of audit, type of work covered, nature of work done, names of those engaged in the audit, and such other data as is necessary.

WORKING PAPERS ILLUSTRATED.—
CAPITAL STOCK AND SURPLUS

Capital Stock

PRINCIPAL STOCKHOLDERS:

J. G. Ralston	630	shares

EXAMINATION OF MINUTES, CONTRACTS, ETC.

Minutes

Jan. 20—Semiannual dividend of 5% declared payable on Jan. 31 to stockholders of record Dec. 31.

Apr. 19—President and Treasurer authorized to close contract with Avery Co. as of June 30 to purchase their output on special terms.

July 16—Semiannual dividend of 5%—payable July 31 to stockholders of record June 30.

Aug. 18—Treasurer authorized to loan J. G. Ralston, President, $2,000 on his demand note without interest. Salary of R. S. Thompson, General Manager, increased from $9,000 to $12,000 per annum, effective Sept. 1.

Examination of contract with Avery Co., dated June 30:

Provides for purchase of entire output of Avery Co. at current market prices.

Special discount of 5% if semiannual purchases exceed $30,000.

A deposit of $3,000 to be made which will bear interest at 6% payable annually, June 30.

Accounts to be settled promptly for purchases of each month on 10th of following month.

Examination of contract with T. V. Sampson, Sales Manager, dated Jan. 1.:

Drawing account of $375 monthly which is his guaranteed minimum.

Commission of 3% on all sales made directly.

Commission of 1% on all sales made through traveling salesmen.

Special commissions of 2% on amount by which total annual sales exceed $500,000.

All accounts over 90 days old to be excluded from sales in computing these commissions.

Examination of Lease of Premises Occupied for Warehouse Purposes

Period 5 years from Jan. 1—except as qualified later.

Rental $1,500 per annum payable monthly.

Lessor allows $600 per annum toward payment of taxes and ordinary repairs.

After first year lease can be canceled by lessor after expiration of first year on 90 days' notice by payment of $1,500 bonus to lessee and adjusting tax payments made.

RECONCILIATION OF BANK BALANCE

American Trust Co., Dec. 31, 19—

Balance per statement			$68,317.92
Add—Note of Albany Mfg. Co. protested, now returned, including $2.55 fees			252.55
Deposit of Dec. 31 not credited by trust company			1,892.00
Collection charges for December not entered in cash book			6.20
			$70,468.67
Less—Interest credited by bank not entered in cash book		$ 93.10	
Checks outstanding:			
6319	$ 50.00		
6682	125.00		
6714	73.10		
6	139.45		
7	68.25		
8	1,000.00	1,455.80	1,548.90
Balance per cash book			$68,919.77

INVENTORIES

Finished Goods

Page 7—3,390 lb. #37@26½¢	$ 898.35	
Should be @26½¢ per 100 lb	8.98	$889.37
" 12—One lot of various sizes of special ends formerly used—estimated value	$ 600.00	
Upon inquiry superintendent admits that best offer received for this material is	200.00	400.00
" 15—6,840 lb. #59-W@32¢	$2,188.80	
An examination of cost records indicates that present cost of manufacturing this article is 23¢, or a total of	1,573.20	615.60
Selling price was reduced lately from 55¢ to 39¢.		
" 23—Total of page stated at	$ 938.42	
Correct total	838.42	100.00
" 29—4,120 lb. #38-T@62½¢ extended	$3,375.00	
Should be	2,575.00	800.00

Page 33—8,520 lb. #38-T inventoried here in addition to 4,120 lb. carried on page —. Last year's inventory showed 5,300 lb. #38-T. Sales since Dec. 31 have been less than during corresponding period of last year and at reduced price of 60¢ as compared with former price of $1.10. Superintendent admits that demand for this article is lessening and in fact that #39-T is being sold instead. At our suggestion a reduction is made in inventory price from 62½¢ to 40¢. 13,820 lb. @ 22½¢		$3,109.50
" 47—6,340 lb. #43-R. A test is made of the quantities on hand. Allowance is made for sales and for quantities manufactured since Dec. 31, and it is found that inventory should call for 4,840 lb.—difference 1,500 lb. @ 42¢		630.00
Summary page 27 Carried forward as	$3,410.00	
Should be	3,140.00	270.00
TOTAL DEDUCTIONS		$6,814.47

Adjustments have been made to give effect to these deductions.

Inventory total before examination	$73,240.82
Less corrections	6,814.47
CORRECTED INVENTORY	$66,426.35

Count made of quantities on hand for many items indicates that quantities are correct. Item noted was the only difference and this was caused by an error of an unusual nature in stock record.

With changes noted, inventory appears to be valued at cost or market, whichever is lower.

EXAMINATION OF ACCOUNTS RECEIVABLE AT DECEMBER 31

(Accounts examined February 3)

Doubtful Accounts

	Balance	Reserve
Adams & Brown—August purchases. Dealing here many years—credit man says doubtful—say 50%	$ 198.20	$ 100.00
Carter Mfg. Co.—September. New customer—first purchase—does not reply to letters—both credit references doubtful—say 100%.	210.00	210.00
Dale & Dawson—June and July. Credit man insists good—past record good.	380.00	....
J. R. Evans & Co.—April to August. In hands of attorney—attorney reports doubtful—say 40%.	2,640.00	1,050.00
A. L. Jarlin, Jr., Bankrupt. Reports not favorable for large dividend 80%.	390.00	320.00

Gates & Brown—August and September. Credit man says he cannot understand delay—will place in attorney's hands if not paid shortly—say 20%.	350.00	70.00
A. J. Hanna—July. Cannot locate—say 75%.	620.00	460.00
Ives Mercantile Co.—August. Correspondence indicates account will be settled shortly.	410.00	....
Jason & Jason—September. Creditors' committee—say 20%.	1,320.00	260.00
A. L. Miller—October. Former employee—apparently will not pay—say 100%.	120.00	120.00
Nasmith, Jones & Co.—August. Correspondence indicates full settlement.	190.00	....
Total estimated reserve on these doubtful accounts		$2,590.00
Experience for past 5 years indicates an average loss of ¾ of 1% on charge sales.		
For accounts during last 90 days, sales $128,000 @ ¾%		960.00
Total estimated reserve required		$3,550.00

Note remarks following names, dates, and amounts were inserted after interviewing credit man and examining some of his correspondence.

Estimated reserve required	$ 3,550.00
Reserve per books	2,500.00
Additional amount to be reserved	$ 1,050.00

Summary of Accounts Receivable:

Customers' debit balances	$139,380.40
First Street Co. subsidiary	6,917.23
Officers' and employees' balances	8,384.19
Deposit on Avery Co. contract	5,000.00
	$159,681.82
Less credit balances	3,216.27
Balance accounts receivable	$156,465.55

ADJUSTMENTS

(a) Entries to be reversed Jan. 1.

(b) Entries made for our papers only.

(a) Accounts Receivable—Protested Notes	$ 252.55	
Cash—American Trust Co.		$ 252.55
To reduce cash balance and charge protested note of Albany Mfg. Co. $250 and protest fees $2.55 to special account (entered in January cash).		

(a) Miscellaneous Expenses	$ 6.20	
Cash—American Trust Co.		$ 6.20
To include collection charges for December as per American Trust Co. statement, in expenses of year just closed (entered in January cash).		
(a) Cash—American Trust Co.	$ 93.10	
Interest on Bank Balances		$ 93.10
To enter interest credited by American Trust Co. in their December statement (entered in January cash).		
Bad Debts	$ 1,050.00	
Reserve for Doubtful Accounts		$ 1,050.00
To increase reserve from $2,500 to $3,550, as per our estimate.		
Cost of Merchandise Sold	$ 6,814.47	
Inventory of Finished Goods		$ 6,814.47
To reduce inventory of finished goods as follows:		
Total before examination $ 73,240.82		
Corrected total 66,426.35		
$ 6,814.47		
Bad Debts	$ 600.00	
Reserve for Doubtful Accounts		$ 600.00
To set up additional reserve for probable loss on following notes receivable:		
Clarke, Niles & Co., Inc. $400 attorney says 50% $200		
Little, North & Co., Inc. $400 attorney says probably worthless $400		
(a) Accrued Interest on Notes Receivable	$ 35.00	
Interest Earned		$ 35.00
To enter accrued interest on note of Brown & Smith Co., $1,000, from June 1 to Dec. 31, at 6%. Treasurer states interest will be charged until collected.		
(b) Accounts Receivable—Customers	$139,380.40	
" " —Subsidiary Company	6,917.23	
" " —Officers and Employees	8,384.19	
Deposit on Contract	5,000.00	
Accounts Receivable		$156,465.55
Accounts Payable		3,216.27
To distribute accounts receivable for balance sheet purposes.		

(b) Notes Receivable—Customers............	$ 14,900.90	
" " —Subsidiary Company....	1,500.00	
" " —Officers and Employees.	2,000.00	
Notes Receivable..................		$ 18,400.90
To distribute notes receivable for balance sheet purposes.		

NOTES RECEIVABLE

Notes receivable examined which were overdue:	
May 31—Atlantic Mfg. Co., Inc., due Nov. 30, interest 6%—no indorsements..	$ 500.00
Company requested a 90-day extension which has been granted—expect to collect.	
June 1—Brown & Smith Co., due Dec. 1—interest not specified, indorsed by J. G. Blake & Co.....................	1,000.00
Indorsers agree to pay if maker does not settle by March 1. Treasurer says interest at 6% was agreed. See adjustments for accrual.	
Total notes receivable examined, all customers' notes including the above as per adding machine tape posted on this sheet..	11,340.90

Notes receivable out for collection with American Trust Co.:	
Allen & Smith, due Jan. 20..............................	$ 500.00
Cason, Jones & Co., due Feb. 10........................	600.00
Republic Mfg. Co., due Jan. 25.........................	250.00
Have bank confirm....................................	$ 1,350.00

Notes reported collected by the American Trust Co. since Dec. 31:	
Central Trading Co., due Jan. 5.........................	$ 380.00
Miller & Nolan, due Jan. 10.............................	430.00
	$ 810.00

Notes in hands of A. B. Drake, Esq., attorney for collection:	
Clarke, Niles & Co., Inc., due Sept. 30....................	$ 400.00
Attorney expects to collect 50%.	
Wilson Mercantile Co., due Aug. 31......................	600.00
Attorney has lien on property and expects to collect in full including expenses.	
Little, North Co., Inc., due Mar. 15......................	400.00
Attorney advises this note is probably worthless.	
	$ 1,400.00

See "Adjustments" for addition to reserve for doubtful accounts on account of Clarke, Niles & Co., Inc., and Little, North & Co., Inc. notes.

Notes of officers, etc.:

Aug. 31—J. G. Ralston payable on demand, no interest....	$ 2,000.00
(Mr. Ralston is the President of the Company.)	
Sept. 30—First Street Co., due Mar. 31, interest 6%......	1,500.00
This is a subsidiary.	

Summary of Notes Receivable:

Examined	$11,340.90
Out for collection	1,350.00
Collected since Dec. 31	810.00
In hands of attorney	1,400.00
First Street Co. subsidiary	1,500.00
J. D. Ralston, President	2,000.00
Total per ledger	$18,400.90

EXAMINATION OF VOUCHERS

Jan. 27—A. B. Stein & Co., 2 desks and chairs	$ 84.30
Charged to General Expense—see if this should not be charged to Furniture and Fixtures.	
Feb. 13—Cason & Dennis, paid Feb. 22	380.00
Terms 2%, 10 days—discount not deducted—why?	
Apr. 16—American Mfg. Co., special commission	218.00
No details; voucher not approved.	
May 9—New York Central freight on car N. Y. C. 101837 from Utica	183.40
See if this freight applied on goods purchased f. o. b. destination.	
June 17—Oceanic Metals Co., 1 special cutter #17 to replace old cutter for which $30 allowance was made	310.00
Charged to Repairs, Machinery—see if this should not be charged to Reserve for Depreciation.	
Aug. 10—United Transportation Co., for rent of touring car for Mr. Jones, salesman, 3 days	150.00
Charged to General Expense—see if this should not be charged to Selling Expense.	
Oct. 15—A. B. C. Mfg. Co. for 1 lathe	230.00
Charged to Repairs and Machinery—see if this should not be charged to Machinery account.	
Nov. 10—T. S. Watson, salesman	130.70
Commission not approved by Sales Manager.	

Cash

ITEMS INVOLVED.—Cash to be verified consists of one or more of following:

1. Petty cash funds
2. Branch office funds
3. Miscellaneous funds in custody of officers or employees

4. Receipts not as yet deposited
5. Bank balances
6. Funds in custody of other institutions or individuals
7. Cash in transit
8. Cash in foreign depositories

Wherever possible, count all cash on hand, including cash funds, simultaneously. If this is not possible, take precautions to prevent confusing of funds already counted with those to be counted. In some cases it may be necessary to place a seal on the package or receptacle, holding that part of cash already counted until balance of cash has been counted.

PETTY CASH FUNDS.—There is usually found, as part of the cash fund, vouchers and also memoranda representing cash. Examine the vouchers and, if possible, determine the propriety of expenditures during the count. Examine closely memoranda representing loans, advances, and miscellaneous disbursements to determine whether such memoranda truly represent amounts involved and also whether such items should be brought to attention of someone in authority. Other memoranda may represent charges to be made to expense or other accounts.

List items composing petty cash funds as to amounts only for such items as currency, bills, checks, or vouchers which are in order, etc., and in detail for those items to be investigated or reported, so that they can be taken up without further reference to the fund or client's record thereof.

Bear in mind during the count that the cashier may be ill at ease. Do everything possible to remove any nervousness on the part of the cashier. If differences or peculiar items are noted, they should be discussed with the cashier as if such items can without question be explained. However, this attitude should not prevent making a thorough investigation of such items.

BRANCH OFFICE FUNDS.—When arrangements are made for the auditor or his representative to visit the branch office, verification of the fund should be along lines outlined for a petty cash fund, with the possible exception that items representing disbursements made for account of the main office should be traced into to the main office records or confirmed at that office. If you do not visit the branch office, request someone in authority to furnish you a list of items composing the fund at a given date.

If the branch office is visited, bank balances, which may be a part of the branch office funds, should be verified in same manner as are home office bank accounts. If branch office is not visited, secure a certificate of the balance at a given date from the bank; a copy of the reconciliation of the balance should be forwarded to you for examination.

MISCELLANEOUS FUNDS IN CUSTODY OF OFFICERS OR EMPLOYEES.—Extent of verification of these funds depends on their amount and nature of the duties of the person in question. If a fund is relatively small, say $25 or $50, and is held by a salesman who does not handle any other cash for the firm, a confirmation by letter is sufficient. If the salesman is near at hand, however, the fund can just as easily be counted. Where these funds are large and are held by persons who handle other cash items, it is advisable, if possible, to count the funds and to make a verification of the other amounts for which such persons are responsible.

Where funds are confirmed by letter, make request for composition of the fund at time reply is made. To make certain that information desired is furnished, tell the holder of the fund that his reply should give the following information as to the fund:

1. Currency
2. Checks
3. Vouchers in detail
4. Memoranda in detail
5. Other items in detail
6. Total fund

The nature of the replies may be a revelation to the treasurer or the cashier.

RECEIPTS NOT YET DEPOSITED.—Make certain that when you call for all cash on hand, the cashier understands that receipts awaiting deposit are included in his request—otherwise you may discover later that other funds were on hand at the moment when the funds were counted. In such a contingency a question may arise whether all funds were really intact. Count receipts of this nature either at close or beginning of the business day, so that there will be no difficulty in proving such receipts with the records. In some cases it can be arranged that the cashier prepares his deposits for the bank from receipts on hand at the close or the beginning of the day, and the cash items making up the deposit can then be sealed until taken to bank, so as not to be confused with later receipts. An assistant should accompany the clerk making the deposit; in addition the deposit should be confirmed by correspondence direct with depositary. If this is done it is not necessary to count and prove with the records the later and undeposited receipts, and such a procedure serves to make certain that an amount equivalent to the day's recorded receipts was deposited.

BANK BALANCES.—Verification of bank balances generally consists of two operations, viz.:

1. Reconciliation of bank statement or passbook with client's cash records.
2. Confirmation by direct correspondence with depositaries of the balance appearing on statement or passbook and of any deposits in transit or other items in doubt, about which the bank may have knowledge.

Reconciliation of bank balance covers more than the preparation of a statement giving items necessary to reconcile client's bank balance with that reported by bank. The real purpose of this statement is to know the differences so that they may be investigated thoroughly. Entries in connection with checks outstanding should be examined, and, unless it is apparent why the checks should be undeposited, investigation should be made. It may develop that one check is outstanding because there is a dispute as to actual amount due. Another check may represent a duplicate payment, check for which is being held by creditor pending investigation.

When paid checks are being compared with cash records, examine the indorsements. Investigate checks for large amounts cashed or indorsed in blank. List all checks drawn to order of employees, "Bearer," "Cash," etc., for investigation if entries in cash records are not self-explanatory. Note other peculiarities for investigation.

Whether the examination covers all or only part of the period, items which do not appear in order should be investigated thoroughly; in fact, the merit of an examination of a short period consists, in large part, in that nothing in that period will be accepted unless absolutely in order, whereas too often examination of all checks issued during the period under review causes a loss of interest on the part of the auditor, with the result that an important item is overlooked and the favorable impression created by an otherwise good audit spoiled.

When deposits appearing on bank statement or passbook are compared with cash records, note the dates to make certain that receipts are not withheld a few days before their deposit.

Examine amount credited by bank for interest to determine whether rate of interest allowed is sufficiently high. Also examine charges for collection, etc., to determine whether excessive, and if total is high consider whether some other method of handling these transactions might bring about a saving.

Compare checks drawn for transfers between banks where there are two or more bank accounts with deposits representing transfers, and account for all such checks and deposits.

The letter to depositary requesting confirmation of the bank balance is generally dictated by the auditor and written on the client's letterhead. It should be signed by someone authorized to sign checks, as some depositaries refuse to recognize these letters unless the signature has been filed with them. Some auditors use their own letterheads or special forms with their names at the head and have the letter or form countersigned by client or his representative.

It is better to defer writing such letters until bank balances have been reconciled so there may be included requests for confirmation of deposits in transit or other items which should be confirmed by the depositary.

When the audit is made several months after close of period under review, question arises as to whether the bank balance of last month available should not be reconciled and confirmed in addition to that at close of period covered. Where cash receipts and cash disbursements are handled and recorded separately and each day's receipts are deposited separately and cash records appear to be in order, it is sufficient to reconcile and confirm the balance at close of period under review with a test verification in totals of the deposits recorded for subsequent receipts.

FUNDS IN CUSTODY OF OTHERS.—This caption does not include bank balances or funds in custody of officers and employees. Verification of funds in custody of others would generally be made by correspondence direct with holders of such funds. Satisfy yourself that persons or firms in question are reliable and that such funds are available for the purpose for which created. Also ascertain whether interest is being paid or accrued on these funds.

CASH IN TRANSIT.—Verify cash items in transit by inspection of the records or of reports prepared by forwarding and receiving offices. Where the examination is actually in progress at one or both offices at time of transfer of cash items, it may be possible to verify the actual forwarding and receipt and deposit of such items. In such cases the auditor of the forwarding office should immediately notify his co-worker at the receiving office so that he can inspect the cash upon its arrival.

CASH HELD IN FOREIGN COUNTRIES.—Supplement the usual verification of these funds as to the amount in foreign currency by a determination of the value of such funds in American currency. Unless there is some special reason, these amounts should be carried at rates of exchange prevalent at date of close of period under review and an adjustment made for difference between such values and book values.

CASH RECORDS.—Unless the concern under audit is large, having an adequate system of internal check, make certain tests of entries in cash records. The extent of these tests depends on size of the concern, adequacy of system of internal check, and scope of the audit.

Make tests of footings of cash records. Prove monthly amounts deposited with cash receipts.

When deposits per bank statement and paid checks are compared with the

records for a few months only, scrutinize entries for balance of period to ascertain whether all entries appear to be in order.

Compare composition of the deposits, if a record of details is available, with items representing the cash receipts, for a few days, to make certain that actual items received are deposited.

After verification of cash funds and bank balances, prove amounts thereof with balances in the records.

COMPOSITION OF CASH.—As a rule cash will be stated on the balance sheet either as:

Cash, or
$\left.\begin{array}{l}\text{Cash on hand}\\\text{Cash in banks}\end{array}\right\}$ or
Cash on hand and in banks

There is generally included in the cash on hand item a miscellaneous assortment of cash items. For instance, cash on hand may comprise any or all of the following:

1. Petty cash funds, including cash, checks, vouchers, memoranda, etc.
2. Cash advances to salesmen or other employees
3. Postage or other stamps (for nominal amounts only)
4. Cash on hand for deposit
5. Cash items in transit
6. Miscellaneous small deposits for which receipts are held in cash drawer

Make certain, before including any items in cash, that they are really of the nature of cash, that the amounts which do not represent currency or good checks are nominal only, and that the amounts can readily be converted into cash and can and will be used in current operations of the business. In any event, do not include items other than currency or good checks in a cash caption without qualification, if their sum is large in the aggregate and the total of such items represents a large portion of the cash item stated.

State cash funds held for a special purpose separately with proper qualification, unless amount involved is comparatively small.

Where there are several bank accounts and there is an overdraft in one or more accounts, do not state cash in bank as the net amount of all bank balances, unless the overdrafts are for nominal amounts which were made good shortly after close of the period. The overdraft, when stated separately, should be included among accounts payable.

Notes Receivable

PROCEDURE.—Notes receivable may be divided into four groups:

1. Notes on hand
2. Notes out for collection (not overdue)
3. Notes in hands of attorney or others (overdue)
4. Notes discounted (not due as yet)

Inspect **notes on hand** and compare with the **note record** or a list of the notes. The list of the notes should be prepared by client's employees, unless there are but few notes on hand. In the latter case you may prepare your list as you examine the notes. Compare the notes with the list or record as to date, name of maker, amount, due date, and rate of interest. Make nota-

tions as to rates of interest and names of indorsers, if any, and if there are no indorsers and no rate of interest is specified, note these facts, so that the data will be available if questions arise as to these points at a later date. Sometimes payments are made on account of notes and amount of such payments is entered on the note. Note the amount of such payment as a deduction from amount of the note.

Verify **notes out for collection** by correspondence with the bank or the other concern holding them. If there is a long list of such items, furnish the bank a list of the notes in duplicate, with a request that the list be examined and the copy returned with letter of confirmation. This list should contain a complete description of each note.

Some notes may have been collected since close of the period. Verify such collections by inspection of entries in cash records.

Overdue notes in hands of attorneys or others for collection should be verified by correspondence direct with holders thereof. Request should be made for the estimated realizable value of such notes.

The **total of these three groups** of notes should be compared with the Notes Receivable account and any differences should be located and adjusted.

Confirm **notes discounted** by correspondence with holders thereof.

It is as necessary to determine whether provision should be made for doubtful notes receivable as for accounts receivable. In some businesses notes given in payment of accounts are signs of credit weakness. In other businesses it is customary to give and take notes in connection with practically every transaction.

In examining accounts of concerns in the first group above mentioned, bear in mind that a reserve should be provided to cover practically all notes on hand. Make provision, as a rule, for old notes in hands of attorneys or others for collection which are not likely to be collected in full.

Make certain that the notes receivable received from others than customers—for instance, from affiliated companies, officers, etc.—are earmarked, so that they may be stated separately in the balance sheet.

Test calculations of accrued and prepaid interest on notes receivable. Do not include interest on overdue notes among assets unless it is reasonably certain that both principal and interest on such notes will be collected.

Scrutinize entries in the note record representing closed transactions, to ascertain to what extent notes on hand represent renewals of notes matured.

Accounts Receivable

CLASSIFICATION.—Consider the verification of balances representing accounts receivable under two main headings:

1. Customers' or trade accounts receivable.
2. Other accounts receivable

CUSTOMERS OR TRADE.—Work to be done in connection with the verification of balances of customers' accounts receivable varies in extent, depending on the size and general reputation of concern under audit, condition of accounts, and system of internal audit.

Small Concerns Without Internal Check.—Accounts of a very small concern having practically no system of internal check should be examined in some detail. Test postings, footings of accounts, and calculations of balances; and compare balances with the trial balance or list of balances. Verify footings of the trial balances and prove totals with controlling

accounts. Test postings of a section of the accounts receivable, especially those representing cash credited to the accounts. Ascertain whether all balances represent specific open items. Determine estimated value of the accounts.

Determination of the **value of the accounts** should be accomplished by scrutiny of the accounts and by placing a **distinctive mark** on the trial balance or other list next to the balances, or by listing the balances which can be allocated to any of the following groups:

1. Accounts which appear to be overdue, having in mind invoice terms.
2. Large balances in accounts where former balances have been comparatively small.
3. Accounts on which notations are found, such as "Bankrupt," "Deceased," "Cannot locate," or other expressions which might indicate that there is some doubt as to their being collectible.
4. Balances due from officers, employees, affiliated companies and depositaries.
5. Balances representing sales of equipment, scrap, etc., or charges made for services, or any charges other than those which are part of the regular business of the concern.

Review balances so marked or listed with the executive who handles credits. Examine the latest data available relative to each balance of this nature, and if the account does not seem to have full value, determine approximate amount which should be reserved to make provision for the doubtful accounts.

After all balances noted have been considered and total estimated provision for such balances have been figured, give consideration to the amount which should be provided for other balances not in the overdue period—for example, the balances representing transactions of the last 60 or 90 days. Based on past experience a **percentage** should be applied to the charge sales of the last 60 and 90 days, to determine amount to be reserved for these accounts. The sum of this amount and that provided for the overdue accounts, etc., represents the **reserve to be deducted** from the accounts so as to state them at estimated realizable value.

This procedure serves not only to value the accounts but to give the auditor information relative to the condition of the accounts and the ability of the executive handling credits.

Balances for very small amounts need not be considered in arriving at amount of the reserve for doubtful accounts unless such balances are numerous, in which case an estimate should be made for the amount to be provided for these balances as a whole.

If the small balances do not represent amounts owing for current transactions investigate them, as it is likely that these items should be closed out by credits for refunds, allowances, etc., or that they represent disputed balances which will probably not be collected. Ascertain whether disputed items and claims for refunds, allowances, etc., are on the increase, and bear in mind this tendency in valuation of the accounts and preparation of the report.

Total credit balances in the accounts receivable so as to state such items separately as a liability in the balance sheet. Examine such balances to make certain that there is an actual liability, or that the amount of the liability in each case is not in excess of the balance carried. If some of the credit balances represent deposits for substantial amounts made with creditors and others which are not repayable in a short period, state the aggregate

of such balances as an individual item so that the nature of this liability may be clear to anyone.

Determination of the value of the accounts necessitates consideration of possible **reductions** through discounts, allowances, freights, miscellaneous rebates, etc., not indicated in the accounts. An account which will be collected subsequent to date of balance sheet should not be carried at a greater value than the amounts which would have been added to the assets if the same account had been collected prior to such date. An amount should be reserved for discounts, etc., to be allowed subsequently.

Where the balances are fairly large and are owed by business concerns, but not by individuals, and in any event in case of balances due by affiliated companies, consider the advisability of confirming the balances by direct correspondence with each debtor. This is a real verification of customers' balances, if all requests for confirmation are complied with. However, many clients object to such confirmation, and when this method is used many debtors addressed will not reply to requests for confirmation.

Procedure generally followed in **verification of accounts receivable by correspondence** is as follows:

1. Statements are prepared by client's employees of balances as at date of audit.
2. Statements are compared by the auditor with ledger balances.
3. Either a letter requesting confirmation of the balance is enclosed with the statement, or confirmation is requested through a notation inserted with a rubber stamp on face of statement.
4. Statements should not leave custody of the auditor after they have been compared with ledger balances.
5. Statements should be mailed by the auditor and as a rule a stamped envelope addressed to the auditor should be enclosed for reply.
6. In some cases debtors are requested to communicate with the auditor only in event that the statement is found incorrect.
7. Replies received should be examined carefully and all differences thoroughly investigated.
8. If replies are received covering practically all accounts, those for which no replies are received should be scrutinized closely.

When the total of customers' balances is not in agreement with the control account, it is not the auditor's duty to locate the difference. Call the client's attention to the difference and the general condition of the accounts. A special arrangement may be determined on, whereby the auditor undertakes to place the accounts in agreement, but the auditor should be careful in such case not to underestimate the time necessary for such work if a fixed fee is arranged, or to permit the client to have too optimistic a view of the situation if the work is done at day rates.

As a rule the method of locating such differences which gives best results is by "reverse posting." This consists of a detailed analysis of the entries in the ledger so that the items for any given period are grouped according to their source. If possible, the groups are arranged in chronological order. Totals of each group are then compared with corresponding totals in books of original entry. The differences should be localized and located readily through this process.

Large Concerns With Good Systems of Internal Check.—Verification and valuation of accounts receivable in audits for this class of clients as a rule does not vary in the nature of work done, but primarily in the ex-

tent of the work. In the first instance, make a thorough study of the system of internal check, including an estimate of the ability of client's staff to follow the system outlined. The work as outlined for the examination of small concerns should then be performed for one or more sections of the accounts and a scrutiny be made of the unusual or extraordinary accounts in the other sections.

If the system for calculating the reserve for doubtful accounts followed by the client's staff is not adequate, examine all accounts with balances in excess of a fairly large amount, and as to these balances follow the procedure outlined for audits of small concerns.

Bad Debts Written Off.—Examine the accounts written off during the last 2 or 3 years and ascertain what is being done to follow up accounts where there is possibility of further realizations. Study the system of handling proceeds from such accounts to make certain that proceeds are properly accounted for.

Accounts Hypothecated.—Be on guard to note any hypothecated accounts. When authority for hypothecation does not appear in the minutes or in a contract submitted for the auditor's inspection and the amount borrowed through this method is stated as an ordinary loan, it may be difficult to ascertain whether or not the accounts are pledged. However, examination of a portion of the cash book entries and scrutiny of the period not examined, as well as examination of the interest, commission, and miscellaneous expense accounts, should bring to the auditor's attention certain peculiarities generally found when money is borrowed in this manner.

OTHER ACCOUNTS RECEIVABLE.—In many audits there are certain receivables which are either included in the balance sheet among accounts receivable or are stated separately. As these items partake of the nature of accounts receivable their verification is discussed under this heading.

C. O. D. Accounts.—Accounts which represent charges for merchandise, which charges will be collected on delivery of the merchandise, are generally referred to as C. O. D. (Cash on Delivery) accounts. As the examination generally begins several days or weeks after the close of the period, verification of such balances is usually not difficult, as it is possible to account for all outstanding C. O. D. items at close of the period by an inspection of the entries for cash receipts or for merchandise returns subsequent thereto. When a certain number of outstanding accounts are found after close of the period, ascertain why the accounts are allowed to stand for any length of time. Make certain that merchandise for the outstanding accounts not shipped to distant points is held and that it has not been included in the inventory. Consider the condition and value of this merchandise. It will be found that certain C. O. D. accounts for merchandise to be shipped to distant points are being handled by express companies, and that allowance must be made in those cases for time required for delivery and return of proceeds. For local C. O. D. items there is no reason, except in unusual cases, why the accounts should be outstanding more than 3 or 4 days.

Deposits.—Amounts deposited under special contracts, etc. (bank deposits excluded), are in the nature of receivables. If amount is large, confirm the deposit by correspondence with holder. Request for confirmation should include inquiries as to interest allowed, if any, and whether there are any liens, offsets, or special conditions which must be fulfilled before return of the deposit.

If amount of deposit is nominal and there is a receipt on hand which must be surrendered before return of the deposit, an inspection of such receipt

should be sufficient verification. This class of deposits includes amounts deposited with gas, water, or electric companies, and similar deposits.

Instalment Accounts.—As to verification of total outstanding, procedure to be followed for instalment accounts does not differ materially from that for other groups of accounts where numbers are large and individual balances small. The system of internal check must be studied closely, with reference to method of taking off trial balances.

As to valuation of these accounts, the important consideration is the number of periods elapsed without receiving the periodical amount owing, and past experience with debtor or with the class to which debtor may be allocated by client. While the concern doing an instalment business has the right to "replevin" the goods in question in case instalments are not forthcoming, proceeds from sales of merchandise replevined are generally not sufficient to cover balance owing on such account. As a rule, for purpose of deciding on amount to be reserved for doubtful accounts, the accounts are grouped according to number of periods elapsed since receipt of last instalment, special consideration being given to fairly large accounts or to accounts which for credit purposes are considered to be of a special nature.

Officers and Employees.—These accounts may aggregate a large sum in some audits and therefore require special consideration. As to the officers, executives, and those employees who have a good credit rating because they have special resources, consider the accounts on the same basis as accounts of other individuals. However, call attention to any of these accounts which are allowed to run for some time without some payments being made by debtors.

As to the other accounts settlements in whole or in part should be made periodically on a definite plan. Any deviation from the plan should be authorized by an executive, the reason for the exception being stated in the authorization.

Officers' and employees' accounts should be summarized so they may be stated separately in balance sheet.

SPECIAL CONSIDERATIONS.—Examine closely contracts for sale of product of the concern under audit and note conditions in such contracts which may have an effect on the valuation of the accounts or the inventories.

Investigate the method of putting through and approving credits for refunds, allowances, and merchandise returned. Try to ascertain whether many of such items are still to be passed. Investigate merchandise on hand which has been returned awaiting credit.

Scrutinize shipping records and consider the possibility of shipments being made without recording a sale. In some audits sales entries immediately preceding close of the period should be compared with entries in the shipping record.

SUMMARY OF ACCOUNTS RECEIVABLE ITEMS.—During the examination keep in mind the manner in which the various accounts receivable items will be stated in the balance sheet, i.e., as to whether or not they will be included among the current assets and whether certain classes of accounts receivable will be stated separately or be grouped with others as part of a miscellaneous item.

It will probably be necessary to provide for some or all of the following divisions of accounts receivable in course of several audits:

1. Customers
2. Employees and officers, for current transactions
3. C.O.D. accounts

4. Deposits repayable during a few months
5. Balances due by affiliated companies for current transactions
6. Deposits with mutual insurance associations or other associations
7. Deposits not repayable within the current year or at a fixed date
8. Accounts in hands of attorneys for collection
9. Accounts in suspense
10. Accounts pledged as collateral
11. Balances due by officers, not being liquidated currently
12. Balances due by affiliated companies, not being liquidated currently

Inventories

NATURE OF SUBJECT.—Verification and valuation of inventories cannot be completed solely by following certain definite rules. There are so many special features in connection with the organization or the methods of each concern which should be considered in every inventory examination that it is impossible to give instructions which can be followed in toto for any inventory investigation.

For convenience discussion of the examination of inventories will be divided into:

1. Verification of inventory quantities and amounts
2. Valuation of inventories

VERIFICATION OF QUANTITIES AND AMOUNTS.—Inventories to be verified may be in the form of:

1. Raw materials or finished goods
2. Merchandise in process of manufacture
3. Merchandise in storage covered by negotiable receipts

PRELIMINARY CONSIDERATIONS.—The first step in verification of quantities of inventories is to ascertain how inventory was taken. If a copy of instructions for taking inventory is available this should be examined, and if such instructions are not available, make inquiries relative to the following:

1. Arrangements made for recording merchandise received (including merchandise returned by customers) just prior to close of period and for recording that received just after close of period.
2. Method of segregating merchandise received on consignment or other merchandise not property of the concern.
3. Provision made for recording obsolete and other stock which does not have full value.
4. Method of checking accuracy of original count.
5. Safeguards against losing or misplacing tags, sheets, etc., used in inventory.
6. Procedure outlined to make certain that liabilities will be entered for all merchandise received in stock.
7. Method of recording units, dozen, gross, tons, etc., so that there will be no confusion when extensions are made.
8. System outlined for pricing inventory, for making extensions and footings, and checking these calculations.
9. Procedure followed in summarizing inventory sheets.

RAW MATERIALS OR FINISHED GOODS.—Verification of quantities of raw materials or finished goods is not a difficult task where merchandise

consists of large and valuable items and the auditor is present when inventory is being taken, or immediately thereafter. In such cases verify practically all quantities by actual count of articles and list comparison of your count with the items on inventory sheets. If, however, all the stock is not to be counted but tests are to be made, work from sheets to stock rather than from stock to sheets, to determine whether the items which have been listed are really in stock. While making the count, note condition of the articles.

If stock consists of many small articles with low unit prices, it is generally not feasible nor advisable to count a substantial portion of the whole inventory; be satisfied with an inspection of the stock as a whole. In such cases examine closely instructions given for taking inventory and question the men who were entrusted with taking the inventory to determine whether they may be depended on to take an accurate inventory. Where possible, endeavor to make tests of some quantities.

While the stock is being examined, make inquiries of storekeepers or persons familiar with the stock as to whether there is any **slow-moving stock** or stock **materially depreciated** in value. Select items here and there which appear to have been in stock for some time. If perpetual inventory records are available, examine the entries for these items to determine how long they have been in stock. If no inventory records are available, question persons familiar with the stock. Make similar inquires about unusually large items in the inventory.

Test general accuracy of the inventory books or sheets. The extent of this verification should depend on the system followed in preparing the sheets and the impression gained of the personnel handling the inventory work.

Test **prices** by comparison with prices for similar items, as shown by some of the late invoices. Also test inventory prices by comparing with the prices on invoices for sales subsequent to the period, to determine whether the prices are being maintained.

Make **tests of extensions.** A good method of making such tests is by scrutiny of each page of the quantity, price, and amount columns as a test of the extension for each comparatively large figure. For instance, if quantity of an inventory item is large, the amount should be correspondingly large unless unit price for such an item is very low, and same is true of an article which had a very high price—the amount would be high unless the quantity is very small. On the other hand, a large amount should arise from a comparatively large quantity or a high price. Through this method you should discover errors for substantial amounts and time taken for such verification should be relatively brief. With an inventory of, say, several hundred thousand dollars it is hardly worth while to endeavor to locate a certain number of small errors which might change the inventory total by only a few dollars. However, if it appears that there are many such errors, call attention to this condition and request a further check of the inventory calculations by client's employees. If there are comparatively few sheets, footings of dollars only for all sheets may be verified. If sheets are numerous, test footings of sheets by scrutiny of amounts and of total for each sheet, verifying those for which the details appear to aggregate more or less than the total listed.

Check the summary of the inventory in detail unless it is voluminous.

When scrutinizing the quantities and prices, note for further investigation any **peculiar items** not in order, as:

1 lot of scrap metal and parts....................	$1,320.00
Merchandise stored in room 14..................	935.00

Any large quantities should also be noted.

Note **names of parties** taking inventories and pricing stock, and of those making the extensions, and ascertain the capabilities of such persons for the tasks assigned.

Where possible make comparison of inventory totals by departments or in sections with the totals for similar departments or sections for the inventory of corresponding period of prior year. Investigate abnormal fluctuations in any department or section. Consider the activity of the sections or departments in connection with the inventory totals for such subdivisions.

If **sheets submitted** for examination are not the original record of the inventory, call for the original sheets or slips and compare some of these data with entries on inventory sheets to make certain that in copying the inventory sheets errors for substantial amounts were not made.

Make certain that all items listed in inventory are **property of client** and that no **liens** exist on any part of the stock.

Whether or not there is a **physical inventory** which can be verified directly with the stock when a **stock record** is maintained, make tests of the stock record to determine the general accuracy of quantities and prices appearing in such record.

In certain instances where inventories for succeeding periods are taken in practically the same order, it is advisable to compare some items to ascertain whether a large part of stock is being carried for a long period and has become obsolete.

Examine the **entries in receiving records** for a few days immediately preceding the end of the period and ascertain whether invoices covering these purchases were included among liabilities of the period. Scrutinize **invoices entered after close of period** to make certain they do not represent liabilities applicable to period under review.

MERCHANDISE IN PROCESS OF MANUFACTURE.—Verification of this item does not present any difficulties where there is a fairly accurate cost system. In such cases familiarize yourself with the method of making entries in cost records and make tests of a number of entries. Verify balances taken off as at close of period. If sufficient time has elapsed so that a certain number of items have been completed, examine cost of goods in process at end of period, subsequent entries, and cost of finished product for some of these items. It should be possible in this manner to ascertain whether the amount as stated for cost at end of the period was fair.

If there is no adequate cost system, it is difficult to determine whether the inventory of merchandise in process is even approximately correct. If amount of this stock is small and there are no indications that there should be a large inventory, little need be done. If amount of such inventory is fairly large, make sufficient tests of the figures presented and investigate thoroughly the method of preparing the figures.

MERCHANDISE COVERED BY NEGOTIABLE RECEIPTS.—Verify the quantities of this stock by inspection of receipts as well as by correspondence direct with the custodian.

INVENTORY CERTIFICATES.—Some auditors request from the officers or certain executives certificates relative to quantities, the price of inventories, and obsolete items therein. There is no harm in requesting such certificates, since it is likely that in some cases such request may bring out information which otherwise would not be forthcoming. However, the fact that such certificates are obtained does not relieve the auditor from any

responsibilities in connection with verification of quantities or of valuation of inventories.

VALUATION OF INVENTORIES.—As both "inventories" and "valuations" are covered in another section, valuation will be treated briefly here.

The general rule of valuation of inventories followed for many years is "cost or market, whichever is lower." During abnormal times it is necessary to value inventories on other bases. Thus where current replacement cost of an article appears to be less than cost, and market price, which is apparently an artificial price, is not representative of that which would really be paid if purchases were made then, it is right to value the inventory at less than "cost or market."

However, the general rule is probably the safest basis for valuation unless extraordinary conditions prevail; even then the inventory should not be valued on such a basis that a profit is anticipated. An exhaustive discussion of this phase of the valuation of inventories is given in Montgomery's "Auditing, Theory and Practice," Vol. I, pp. 116-162.

Value **finished goods** at cost, but the cost figure should only include manufacturing expense, not administrative or selling expense. Examine **overhead expenses** closely to determine whether items included are proper charges. Where goods are being manufactured under peculiar circumstances, such as part time operation or other conditions which create excessive costs, carry finished goods at market prices if such price is available and is less than cost prices.

Cash discounts are sometimes deducted from purchases in entering such items in the books. In such cases deduct the discount from prices used in the inventory.

Freight, duties, and other **incoming charges** are in some cases added to costs. There are proper additions to purchase prices for inventory purposes. Make certain in such cases that these additions to costs have been made properly.

In connection with valuation of inventories, give consideration to **purchase commitments for future delivery.** Ascertain whether quantities purchased are such that, while requirements of the future are provided for, such quantities are not excessive. Also make certain that prices at which these purchases have been made are such that a reasonable profit will be realized on future sales. If commitments, however, are insufficient to take care of future needs, consider the question of prices at which purchases must be made.

Any indication that the situation relative to future purchases will cause a loss should be the subject of a notation on the balance sheet.

Consider sales orders for future delivery in connection with current or future costs; any unfavorable condition in this respect should also be the subject of a balance sheet notation.

Merchandise on hand which has been **sold for future delivery** should not be valued on the basis of selling price less charges to be incurred when the transaction is completed. This serves to anticipate a profit which belongs to the next period. The many contingencies such as cancellation of orders, loss of merchandise through fire, insolvency of purchaser before delivery, make such a practice inadvisable.

SUPPLIES.—Inventory of supplies should be verified in practically the same manner as the merchandise inventory. The question of excessive quantities should receive serious consideration.

State inventories of supplies on the balance sheet separately from merchandise items.

In manutacturing audits it is usually advisable to state inventories in following detail:

1. Raw materials
2. Goods in process
3. Finished goods
4. Supplies

Investments

PROCEDURE.—The auditor's verification of investments may de divided into:

1. Verifying existence of and title to investments.
2. Valuation.

Verification of existence of investments is made either by inspection of the documents representing the investments if these can be examined, or by correspondence with the holders thereof if an examination cannot be arranged.

Ascertain whether the investments are in the name of the client or are in negotiable form. Note the description carefully to ascertain nature or class of the stock or bond. Note maturity dates of bonds not only as to years but also as to month and day, as some bonds are issued in series maturing annually, semiannually, monthly, or even semimonthly, and there is generally a difference in value of bonds with different maturity dates. Examine coupons attached to bonds to make certain that all unmatured coupons are intact.

Examine all investments on hand at one time to prevent the possibility of same items being submitted twice for inspection and thereby covering a shortage. It is advisable to have a list of investments as per records when inspecting the securities, to make certain that the items submitted are all those which should be on hand.

When verifying securities by correspondence ascertain not only that the securities are in client's name or in negotiable form but that they have not been pledged or hypothecated.

Where there are many security items and there is a possibility that the securities might be borrowed and later replaced, note dates of the stock certificates and the certificate numbers for comparison with brokers' invoices or other data received when securities were acquired.

If investments are in form of real estate bonds and mortgages, inspect all the papers in connection with the investment. Make certain that taxes have been paid, that sufficient insurance payable in case of loss to the mortgagee is carried, that title policies and appraisers certificates have been obtained. Verify balance outstanding by correspondence direct with mortgagor, and in some cases, where the amount is large or circumstances justify it, by inspection of public records. Ascertain whether all income has been collected.

Verify receipt of all income from bonds and stock and note whether the income is being collected promptly. If the income is large and interest is credited on bank balances, delay in such collections may cause loss.

Valuation of investments which have a ready market presents no difficulties, as it is generally possible to refer to quotations in current publications for prices or to obtain from reputable bankers or brokers prices for securites in question.

If there are no current market quotations for the investments, if the amount is nominal only and income is being received regularly at a fair rate, there can be no objection to carrying such items at cost. If, however, the amounts are large, the auditor should call for and examine the financial statements of the company. If no such statements are available and there is no return from the investments, note in the balance sheet that the investments are stated at book values without verification.

Investments available for sale are generally stated in the balance sheet at cost or market, whichever is lower, unless the difference in amount is not material, in which case cost is used.

Investments not available for sale should be stated at cost, with a notation of the market value.

Plant

INTRODUCTORY.—This expression is used to designate land, buildings, machinery, fixtures, and equipment used in operations of business under audit. Items of the same nature not in use but discarded and probably available for sale are treated under the caption "Other Assets." As the items in question are in use they are discussed from the point of view of a going concern.

If you made the previous audit, you are concerned only with verification of changes during the period. If, on the other hand, it is a first examination, examine the opening entries and principal changes subsequent thereto.

It may be found that there has been considerable confusion in the plant accounts through inclusion of many charges representing renewals or repairs, or that the opposite condition exists wherein a large number of additions have been charged to expenses instead of being capitalized. In such case make adjustments so that plant accounts will represent cost of plant then in use. Sometimes plant accounts are so confused that the balances cannot be considered an indication of plant values, and it may not be possible to trace the entries which should have been made therein. If this condition exists request an appraisal of plant.

Before making any decisions as to plant values or depreciation rates, visit the plant and note the general condition of building, machinery, and equipment. Encourage the superintendent or foreman to talk about the condition of plant, and policy of the concern relative to renewals and repairs. Inspect any large additions or renewals and ascertain reason for addition or renewal at this time. If economies or additional earnings are expected from such changes, make an effort to ascertain from records whether these expectations have been realized.

As a rule verify **plant items** separately in following order:

LAND.—Land should be carried at cost. Where possible, examine original papers in connection with acquisition of land. It is customary to include in cost of land all expenses of acquiring it, such as commissions, fees for title examination, survey fees, etc.

If the examination is a first audit, obtain a certificate from a title company or from an attorney to the effect that the title to the land is in client's name, which certificate should include a list of liens on the property for any purpose. However, if you are qualified to examine public records you can probably satisfy yourself relative to these matters without assistance.

BUILDINGS.—Carry this asset at cost. If any buildings have been purchased, examine the papers connected with the deals. Purchase price prob-

ably includes cost of land, which makes necessary a division of such price so that an amount may be stated separately for the building, in order to calculate periodical depreciation charges. If the building was constructed for client, examine contract and vouchers covering payments made to contractor to verify costs.

If building was constructed by client, examine the charges critically. Include all expenditures in connection with construction in cost of building, as for instance, architects' fees, building permits, inspection fees, salaries and expenses paid as a part of the business expenses directly chargeable to to construction. However, make certain that any overhead expenses apportioned to costs have been equitably prorated. If there is doubt as to such amounts they should be excluded. Interest paid on money borrowed for construction may be included as part of cost. However, take no profit on cost of the building even if total cost is less than estimates received for construction of building or less than cost of similar buildings.

Where some part of building cost has not been paid, add such amount to the assets and also include it among liabilities. Make certain that all buildings are in current use and that none are useless. If any buildings are available for sale, state them separately on the balance sheet.

LEASEHOLDS.—Such contracts are usually valued at purchase price, and annual charges are included among operating expenses so that the leasehold will be written off at its expiration. Examine the contract and make certain that it still has value, and that the amount and time on which periodical charges are based are correct.

MACHINERY, FIXTURES, AND EQUIPMENT.—Items in this account representing large amounts acquired through purchase for which vouchers are available are not difficult to verify. Besides examining the vouchers, ascertain that machinery in question is in use and that it does not represent a renewal or an article having a relatively short life.

The cost of **smaller units** may represent expenditures which should be charged to repairs. Determine that such charges are additions to plant. Depreciation rates applicable thereto should be considered.

Where machinery and fixtures are manufactured by the concern itself, consider the questions mentioned under "Buildings."

Cost of foundation and overhead and other fixtures installed with machinery should be capitalized.

Ascertain whether any machinery has been discarded or is obsolete. Consider the disposition of such items and their valuation. They should be carried at realizable values under such a heading as "Assets Available for Sale."

Verify **instalment payments** in plant accounts by inspection of contracts covering the instalments. Add the amount of instalments still to be paid to both plant account and liabilities. For depreciation purposes consider the total cost of such item from date of acquisition.

Certain **equipment** such as delivery equipment, office equipment, small tools, etc., should be stated separately from the machinery and fixtures, as they require special consideration for purposes of revaluation and depreciation. Small tools are generally revalued at close of each period. Due to the large number of these articles lost, mislaid, or destroyed, this is the best method of valuing this asset.

Some plant items are **deferred charges,** i.e., extraordinary repairs or improvements which are capitalized to be applied against earnings of a certain number of periods. Determine whether the items capitalized represent

extraordinary repairs and improvements, also whether future operations will benefit from these expenditures to such an extent as to justify deferring these charges. Satisfy yourself that the period over which these charges are deferred is not too long. Best practice is to charge such items as a whole to operating expenses when incurred, stating them as special items in the income account.

APPRECIATION.—Some concerns have appraisals made of plant, believing that actual value of plant at a given time is considerably in excess of book value. This appraisal may be made having in mind an increase of insurance carried or an interview with prospective purchasers.

The client may think that appreciated value should be placed on books. Nothing is to be gained by this procedure and you should try to prevent it. If, however, appreciated values are entered on books, increase should be credited to a special reserve or a special surplus account and this latter account should not be used for payment of dividends. Where appraised valuations are not entered on books, plant will be stated on balance sheet at cost and, if desired, a notation may be included giving appraised values.

Examine appraisal papers and satisfy yourself that they cover the plant in its entirety, but nothing else. Ascertain the basis of the valuations, especially if you are not familiar with the work of the appraisal company.

DEPRECIATION.—This is treated elsewhere in this volume. A few remarks are made here.

Depreciate **buildings** over the period of their life in use, the amount of depreciation being based on cost irrespective of present-day values. If buildings are erected on **leased lands,** life of lease should be considered so that value will be extinguished, at the latest, when lease terminates.

Depreciate **machinery, fixtures,** and **equipment** over their useful life, having in mind obsolescence and other causes operating to shorten apparent life.

Examine calculations made for the period under review and ascertain whether provision has been made on a similar basis in previous periods. Consider rates used in connection with estimated life of plant. Ascertain how plant items sold or scrapped have been handled.

When information is available, state the plant account so that the following items will be shown separately:

Land
Buildings net of depreciation
Machinery net of depreciation
Delivery equipment net of depreciation
Office furniture and fixtures net of depreciation

In some cases, where ample depreciation reserves have been provided, it may be advisable to state both cost and amount of the reserve for depreciation in each case so that client will get the benefit of the full provision made. Even in this case the reserve should be stated as a deduction from the asset item.

Other Assets

Several groups of assets cannot be classified under headings already mentioned. Verification of such items is discussed below.

STOCK SUBSCRIPTIONS.—Examine the contract for subscriptions. note dates on which calls are to be made and amounts to be paid on those dates. If these dates have passed and calls have been made without collecting

amounts subscribed, consider the financial responsibility of subscribers. Where number of subscriptions is not large and amounts are substantial, verify subscriptions by correspondence direct with subscribers. Subscriptions due within 60 days from responsible persons may be carried among current assets, but it is preferable to carry these among "Other Assets" rather than in the current asset group.

WASTING ASSETS.—Verification of wasting assets consists of an examination of the papers in connection with their acquisition to determine cost and charges for depletion. As a rule an estimate has been secured of the units the property will yield. The depletion charge represents an equivalent amount per unit which, if set aside as each unit is produced or extracted, serves to extinguish cost of property when all units have been recovered and marketed.

CONTINGENT ASSETS.—Ascertain whether there are contingent assets. If the amount of such assets is of consequence and there is a reasonable possibility of realizing something therefrom, mention them in the balance sheet. Thus the client may be suing in connection with the infringement of a right and developments of the case may be favorable. There may be a substantial amount due from an estate in bankruptcy and information may be submitted which indicates that a dividend will be paid. Question the officers of the company and the attorney relative to contingent assets.

TREASURY STOCK.—Examine certificates in custody of treasurer or other official with reference to date of issue and as to whether they are in company's name. Ascertain how dividends declared on such stock have been handled. Verify cost of such stock.

Accountants differ as to the method of showing this stock on the balance sheet. The majority favor stating treasury stock as a deduction from stock issued, with the difference between cost and par as a special reserve or special surplus. However, many accountants prefer to show treasury stock as an investment at cost.

PATENTS.—Ascertain cost of patents, which is the amount at which they should be carried. Write this amount off over the legal life of the patent, which is 17 years. However, if the value of the patent is materially less after a few years, it should be written off sooner.

COPYRIGHTS.—Like patents, copyrights are valued at cost and written off over their legal life, which is 28 years. In some cases, however, it is advisable to make greater reductions in the cost value of these assets, because their value may be diminishing rapidly from special causes.

SINKING FUNDS.—Verify assets held by trustee of the fund by direct correspondence. Also verify income from securities or other assets since the last examination. Enter this income in client's books in same manner as other income of the client.

GOOD-WILL.—This should be carried at purchase price. The auditor's work in connection with verification of good-will after it has been entered in books, consists in verifying its purchase price. Good accounting practice does not sanction arbitrary increase of the value of good-will.

However, when requested to determine the value of good-will of a business to be purchased, pursue recognized methods. See section on "Good-will."

One method generally followed consists in taking excess profits after allowing adequate executives' salaries and, say, 6% on the investment, and capitalizing such excess profits on the basis of 3 or 5 years' earnings.

Deferred Charges

DEFINITION.—The expression **deferred charges** is used to designate not only such items as bond discount and deferred selling expense, which are deferred charges, but also **prepaid expenses** such as prepaid insurance, rent, interest, etc., which have been expended for current operations and may have value in liquidation. It is preferable to make a distinction in the balance sheet between prepaid expenses incurred entirely for current operations and long-term expenses which may be charged off entirely when incurred if conservative accounting practice is followed.

Verification of deferred charges is treated in two parts, as outlined above.

PREPAID EXPENSES.—As a rule, calculations for prepaid expenses are made by client's employees and the auditor's duty consists in verifying such calculations and making certain that all such items have been included. There may be included under this heading some or all of the following prepaid items:

1. Advertising
2. Insurance
3. Interest
4. Rent
5. Salaries and Wages
6. Royalties
7. Taxes
8. Miscellaneous Expenses

Where calculations have not been made and the auditor must make them, he should arrange his working sheet so that the items will be listed or grouped to make possible the calculation in minimum time and to permit the preparation where possible in one operation of other data in connection with items listed. For instance, when verifying amounts of prepaid or accrued interest on loans payable, the items may be grouped as to maturity dates or as to names of lenders.

DEFERRED CHARGES.—Deferred charges not included in the category of prepaid expenses may be divided for purposes of verification into two parts: (1) deferred charges wherein the original expense by its nature can be allocated to a definite time in the future, and (2) other charges deferred for special reasons.

In verifying charges in the first group it is necessary to make certain that there remains a value to be deferred. For instance, expenditures in connection with **advertising campaigns** may be deferred over periods of 3 years, because benefits to be derived are spread over these periods. However, at the end of a year, due to changes which cannot be foreseen, there may be no further value to the advertising in question. In such case the amount should be written off.

There are expenditures for such items as **bond discount, lease expense,** and other deferred charges through which the expenses incurred in connection with a long-term contract are spread over period of the contract. It is not difficult to verify such items, as practically all that has to be considered is the amount, duration of contract, and the fact that the deferred charge still has future value.

When charges for **experimental expenses** and **organization expenses** are deferred, it is difficult to value these items. Consider first whether these expenditures should not have been absorbed in operating expenses when incurred. If it was proper to defer them, it is necessary to determine whether the period over which these items have been deferred is not too long. The deferred charges should be so stated in the balance sheet that the reader will not be deceived as to their nature. **Current prepaid expenses** should be

listed just below current assets, while **other deferred charges** may be listed below plant. Each of the latter items, if of reasonably large amount, should be stated separately, with full description.

Notes Payable

NOTES PAYABLE CLASSIFIED.—Notes payable may be divided for purposes of verification into four classes, viz., those given to—

1. Banks or bankers
2. Trade creditors
3. Affiliated companies
4. Officers, employees, etc.

VERIFICATION.—If feasible, it is preferable to verify the amount of notes payable by correspondence direct with holders thereof or their representatives. However, where there are many small items representing notes issued to trade creditors, which are in effect the same as current accounts payable, this procedure is not usually followed.

It is not sufficient to confirm only those notes payable which are recorded. The auditor should make certain that he has brought to light all such existing liabilities. Depositaries should be requested to furnish full account of liability for loans, notes, discounts, etc. Scrutinize the **cash book** for items which indicate liabilities in connection with notes outstanding. Examine **interest account** to determine whether there are charges for interest on loans or notes which have not been recorded. Examine **entries in officers' or partners' accounts** to make certain that proceeds of notes payable have not been credited there.

If collateral accompanies a note payable, verify the collateral by correspondence with holder.

Payments for fixed assets are sometimes made by issuing a series of notes payable at regular intervals. In some cases charges are made to the asset account as each note is paid. Examine entries of this nature in the plant accounts and ascertain, before setting up the liability for portion still to be paid, whether it is in the form of notes payable; at such times examine the indorsements to ascertain whether amounts paid in such cases were received indirectly by payee. Paste the paid notes preferably on the stub of the notes payable book.

Call for paid notes and compare them with entries representing discharge of the liability for such items.

Make inquiries as to whether it is customery to issue drafts or acceptances in payment for merchandise or debt, and if so, prepare a list of such acceptances to state the liability on the balance sheet.

Prepare a **summary of the notes payable** outstanding so that it may be possible to state separately, if necessary, the amount of notes due banks and bankers, trade creditors, affiliated companies, and officers and employees. In addition, where maturity dates of notes payable are spread over a long period, prepare a summary giving maturities within such periods as 30 days, 1 to 3 months, 3 to 6 months, 6 months to 1 year, and over 1 year.

Compare the total of notes payable outstanding with the ledger balance. Verify amount of interest prepaid and/or accrued interest on notes payable which has been calculated by client's employees; in the absence of such figures prepare them.

Accounts Payable

ITEMS OMITTED.—Verification of accounts payable outstanding as at date of balance sheet presents some difficulties. The auditor must assure himself that the accounts payable stated on the balance sheet represent the entire liability of client for such accounts.

If a complete record can be maintained of all purchases and contracts for services and supplies, it may not be difficult to determine whether all liabilites incurred and unpaid at date of balance sheet had been entered in books. However, as such a complete record is seldom kept, examine entries made subsequent to date of balance sheet and by inquiry from every possible source of information, ascertain whether all liabilities have been recorded.

PROCEDURE.—Investigate method of handling purchase invoices from time they are received in client's office until they are filed after payment. In some offices each invoice is registered upon its receipt and notations are made in the registers when invoices are returned to the office approved as to receipt of goods. Other concerns do not register invoices, and no record is made until invoice is approved and entered in purchase record.

Plan your work so that all invoices in the office at time of examination will be submitted for your inspection. If there is a **register of invoices,** investigate open items on this register representing invoices covering transactions during the period under review.

Investigate the method of making notations which indicate that goods have been received, also method of approving invoices as to quality and price.

Study the procedure followed in verification of extensions and footings and in placing the final approval before payments are made. Consider the possibility of making duplicate payments, also method followed in forwarding checks to creditors.

Compare the trial balance of the accounts payable ledger, or the list of vouchers payable, with their records and prove the total with the controlling account.

CREDITORS' STATEMENTS.—Compare creditors' statements with creditors' accounts and investigate the differences, however small.

Small differences may represent disputed items for discounts, refunds, etc., which will not be allowed by creditors. If these differences are of long standing, ascertain what is being done to adjust them and whether similar items are likely to arise periodically in future.

Some differences between creditors' statements and the records may relate to shipments in transit from creditors. Note these items so that they can be added to both assets and liabilities.

A statement should be produced for every creditor's balance. If suspicious about missing statements, insist on either the verification of such balances by correspondence or the production of duplicate statements.

RECEIVING RECORDS.—Compare entries in receiving records for a few days prior to close of period with invoices entered, to determine whether liabilities for all merchandise received have been entered in books. Some concerns set aside certain merchandise received shortly before close of the period, omitting this item from both inventory and accounts payable. Insist that these goods be included. A statement of such a firm's condition is not correct unless all known liabilities are included.

ENTRIES SUBSEQUENT TO CLOSE OF PERIOD.—Scrutinize entries made subsequent to close of period in purchase records, cash disbursements records, and other records of a similar nature, to make certain that no liabilities of the period under review have been entered in the following period.

FREIGHT PAYABLE.—The question of freight payable on merchandise which has been received is important in some lines of business where the article handled is low in price and transportation charges comparatively high. In such cases ascertain whether freight on all goods received either has been paid or has been set up as a liability. Such goods should be carried at a price including freight to destination, and freight be set up as a liability.

OVERDUE BALANCES.—Ascertain whether accounts payable consist of current balances not due, or of balances overdue. If there are balances overdue aggregating a substantial amount, this should be commented on in the report.

DEPOSITS.—Balances representing deposits made with the concern under audit should be stated separately from regular creditors' balances unless the amounts are comparatively small. The amounts of these balances should be confirmed by the depositors.

DEBIT BALANCES.—Debit balances of the accounts should be summarized and stated among the accounts receivable. If these balances are large, look into their nature and consider whether it may not be necessary to exclude such amounts from current assets because their collection may be deferred; or they may be offset against purchases.

CONSIGNMENT ACCOUNTS.—If there is merchandise on consignment, make certain that liability has been set up for that portion of consigned goods which has been sold. Amount due on account of goods sold and amount of merchandise on hand should be confirmed by correspondence with consignor.

JOINT VENTURES.—Ascertain whether any liability exists on account of joint ventures, the entire proceeds from which may have been collected by client.

GENERAL.—Some concerns enter all invoices net of cash discounts which they expect to deduct in making payments, in which case purchases and expenses are charged and accounts payable are credited at net amounts. If rate of discount is low and client has ample funds to discount his bills, there is no objection to this practice. As a rule, however, discounts are generally considered as earnings of the period in which payment is made and full amounts are set up as liabilities.

State accounts payable in the balance sheet so that amounts due each class of creditors may be ascertained. However, where amount due any class is relatively small, there is no objection to its being included with that for some other class. Accounts payable may be stated in the following detail:

1. Trade creditors
2. Officers and employees
3. Affiliated companies
4. Deposits
5. Credit balances of accounts receivable

Accrued Liabilities

CLASSIFICATION.—The expression "accrued liabilities" is used to designate accounts owing but not due which are not evidenced by invoices

or other definite form of account payable. Items for which invoices have been received should be included among accounts payable. Some items usually classed as accrued liabilities are:

1. Accrued wages
2. Accrued interest
3. Accrued taxes
4. Accrued royalties
5. Accrued insurance premiums
6. Accrued rent
7. Accrued traveling expense or other miscellaneous expenses

As a rule, calculations and entries for accrued liabilities are made by the bookkeeper. The auditor verifies these calculations and makes certain that all such items have been included. Prove the amounts with balances appearing in the ledger. Verification of these amounts includes an examination of the contracts on which the charges are based. Investigate terms of the contract to determine the necessity of the expenditure and whether the charge made is excessive.

COMMISSIONS.—A form of accrued liabilities which may easily escape detection is commission on sales, especially where salesmen receive salaries and a small commission in addition. Investigate commissions, refunds, or special discounts allowed customers. These amounts are sometimes deducted from settlements made by customers and no record is made until that time. Set up these commissions, etc., accrued to date of audit as liabilities or as deductions from assets.

LEGAL FEES.—Another form of liability which may easily be overlooked are legal fees. Lawyers, as a rule, do not send in bills promptly. As you will undoubtedly come into contact with some of the fruits of lawyers' work, ascertain whether the client has been billed and, if not, obtain a bill or at least an estimate of the expenditure incurred.

Foreign Accounts

CONVERSION RATES.—In addition to the usual verification of items held in foreign offices as such, the question of valuation of the balances is important. Convert cash and current items at rate prevalent at date of balance sheet. Carry fixed assets and permanent investments at cost, i.e., the rates which were in effect when the assets were acquired. There is no more justification for reducing the value of such assets, if they are used in operations of the business, when there is a drop in exchange rates, than there is for reduction of the amount at which plants in the United States are carried because values have dropped. Depreciation of these foreign assets should be based on full cost.

Bonds and Mortgages Payable

BONDS PAYABLE.—Verification of bonds payable is generally made by correspondence direct with the trustee. However, if the bond records are kept by the corporation, examine the bond ledger, making special note of bonds listed as being held by the treasurer. Examine canceled bonds, representing reduction of indebtedness, to make certain that they have been sufficiently mutilated to prevent being issued again.

If the bonds have been issued shortly before date of the examination, examine the minutes of the board of directors, also contracts for sale of the bonds, and trace proceeds through the records. As a rule, a copy of the bond

is preserved and attached to the minutes. Examine this carefully, noting any special stipulations. For instance, some bond issues define net income from which dividends are to be paid as the balance after deducting certain expenses, depreciation, etc., stipulating rates of depreciation. In such cases, insist that the stipulation be followed and, if it is not, call attention to the violation of the terms of the agreement if such violation is not apparent from the financial statements published. There may be provision for a sinking fund. Ascertain that the fund is created and kept up in accordance with the stipulations. Investments and cash held by trustee for the sinking fund should be confirmed and income from such investments verified.

Verify interest accrued on bonds. If coupons which have been paid are in custody of the client, make certain that they have been canceled so that they cannot be presented for payment a second time. If paid coupons have been destroyed by trustee, obtain a certificate from trustee relative to their disposition.

MORTGAGES PAYABLE.—Verify mortgages outstanding by correspondence direct with holders or their representatives. The confirmation should include not only amount of the mortgage and date of maturity, but also amount of interest due or accrued. If there are special conditions in connection with payments to be made, familiarize yourself with terms of the mortgage so that you can call attention to those conditions which have not been fulfilled. If considered necessary, inspect the public records to determine that the amount of the mortgage has not been understated. If doubtful as to whether you can make an intelligent examination of the public records, it may be advisable to employ a local lawyer or to resort to a title company for such service. This procedure should usually be followed if partial payments have been made on the mortgage and it is considered necessary to verify the fact that such payments have been recorded.

Note whether the mortgage is the direct liability of client or whether client purchased the property subject to a mortgage executed by previous owner. In the first case the client, in case of foreclosure, is liable for the deficiency, if any, after applying the proceeds of sale of properties, to full amount of the bond and all expenses; in the second case, mortgagee has recourse for such deficiency to the previous owner only. The mortgage mentioned in the second case should be stated on balance sheet as a deduction from value of property; in the first case it is necessary to state the mortgage so that it will appear among the liabilities in some form.

Reserves

CLASSIFICATION.—Reserves may be grouped under following principal headings:

1. Valuation reserves such as reserves for bad debts and for depreciation of machinery.
2. Reserves to set up estimated liabilities where actual amount of liability is not known.
3. Reserves to set aside profits or surplus for special purposes, such as for working capital or sinking funds.

Reserves of the first group have been discussed under headings for the respective assets.

Reserves to set up liabilities should be verified through an examination of all data in connection with each liability in question. This form of reserves

should not be used where the liability is definitely known and is represented either by an invoice, which should be included among accounts payable, or by charges accruing for specific amounts, which should be stated as accrued liabilities.

As an illustration, a reserve should be provided for estimated losses to be incurred in connection with employees' liability insurance carried by the concern itself. The auditor should ascertain the basis of the reserve, and from past experience of the concern determine whether amount reserved is approximately correct. A reserve should be provided for contingent liabilities, the amount of which can be estimated on the basis of data which indicates that an expense or a loss may be incurred.

RESERVES FOR TAXES.—Reserves are usually provided for federal and state income taxes. If preparation of the tax return is not a part of an auditor's duties, at least examine the calculation to satisfy yourself that the liability has been figured correctly. Also make inquiries relative to the possibility of additional liability in connection with taxes of prior years. Your knowledge of tax work should be such that you may know intuitively when special questions will arise which may cause large assessments to be made for income taxes for prior years. If not allowed to look into tax questions of prior years and you have a suspicion that large assessments may be levied, note on the balance sheet that the question of the tax liability of prior years has not been reviewed.

RESERVES OF INSURANCE COMPANIES.—Reserves are set up by insurance companies for unearned premiums and for losses not yet settled. The first mentioned reserve is not difficult to verify. The reserve for losses of insurance companies is an estimate of the amount which it is expected to pay on each of the large items, and as a rule a lump sum estimate for the smaller items. Verification of this reserve requires a certain amount of technical knowledge. However, as the auditor's work is generally done some time after the reserve is created, he usually has the advantage of knowing that a number of the losses have since been settled and that additional data has been received concerning others.

SURPLUS AND SECRET RESERVES.—Examine reserves mentioned in the third group in connection with data considered at time they were created. They are part of surplus and should not as a rule be placed with the liabilities.

The secret reserve is not a direct reserve but represents a condition which exists when assets are understated or liabilities are overstated, so that there is created a margin which cannot ordinarily be ascertained without a detailed examination of the records. Do not encourage the creation or continuance of such reserves unless certain that it is not done to deceive and that those who have knowledge of its existence will not use it for personal gains.

Contingent Liabilities

PROCEDURE.—Ascertaining the amount of contingent liabilities is, as a rule, not a simple task. Amounts of such contingent liabilities as those for **notes discounted** at bank or for the indorsement on paper held by bank with whom the client has funds can usually be determined through a request for such information as a part of the letter written to confirm the amount of the bank balances. Contingent liability for notes discounted elsewhere may be ascertained in some cases by an inspection of the proceeds of notes receiv-

able and a comparison of such entries with entries in the record of notes with special reference to maturity dates.

Contingent liabilities for **indorsements** and **guaranties** other than those to depositaries should arise in case of corporations only after authority has been granted by directors as evidenced by the minutes of their meetings. However, in many cases such liabilities may be created, especially in connection with the transaction of affiliated companies or subsidiaries, without specific authority for each transaction. Make inquiry of the officers relative to such items. In some cases it may be advisable to request the officers to make their replies in writing so that the auditor will have a permanent record. The company's counsel should also be asked to furnish a statement of contingent liabilities.

Another class of contingent liabilities consists of claims contested by client. As a rule these items are not entered in the books of account. However, it is quite likely that legal fees or expenses in connection with such litigation will be found in the records and that a record of these items may be found in the minutes. Letters to company's counsel should also cover this class of contingent liabilities. There may also be contingent liabilities in connection with unfulfilled contracts, which should be noted in an examination of the contracts.

Other Liabilities

Certain liabilities should be considered in every audit which cannot be classified under preceding headings.

CONTRACTS FOR FUTURE DELIVERY.—There is no present obligation to make a payment in connection with contracts of this nature and in some cases no liability will arise, since the goods ordered may not be delivered. However, examine such contracts, ascertain the extent of the liability, consider the client's ability to meet the payments, and also ascertain whether the prices of the goods ordered have been reduced appreciably since placing the order. If client may not be able to meet the payments, a notation of amount and dates of payments should be made on the balance sheet and the question should be discussed in the report.

JUDGMENTS.—Make certain that there are no liabilities on account of judgments entered against the concern. Sometimes data relative to judgments will be found in the lawyers' bills or in the minutes. If there is ground for suspicion that there are judgments entered against the client, search the public records. If not competent to make search, employ an attorney.

AUDIT FEES.—It is usually stated that all liabilities must be included in the balance sheet. There is probably one exception to this rule, since it is not customary to include among the liabilities the amount of the audit fees except where liquidating accounts are prepared. As a rule it is not possible, except where there is a fixed fee, to determine the actual liability before completing the audit.

CERTIFICATES AND COUPONS NOT REDEEMED.—Some concerns sell special certificates, coupons, etc., to be surrendered when merchandise is purchased. An amount should be set up for liability for unredeemed certificates and coupons at date of balance sheet. Examine the stubs or other records of the issue of these certificates or coupons, also entries covering delivery of merchandise for which certificates, etc., have been surrendered.

CONTAINERS.—Where containers, i.e., bottles, barrels, etc., are billed to customers at a price greater than their value in use, with the provision that refunds will be made on their return, a liability should be provided for the amount by which the amounts billed for the outstanding containers exceed their value. Investigate the method of handling returned containers, to ascertain whether there is any possibility of containers from other concerns being accepted. Ascertain whether refunds are made for containers in poor condition.

UNCLAIMED DIVIDENDS.—Entries in this account should be scrutinized to determine whether all unclaimed dividends have been credited. Payments made subsequently to stockholders claiming such dividends should be examined closely, receipts therefor submitted for inspection, and indorsement on the paid check examined. Payments made in currency and charged to this account should be considered with suspicion, especially if the dividends have been unclaimed for several years.

Capital Stock

VERIFICATION.—Examine a copy of the certificate of incorporation to ascertain amount of capital stock authorized and kinds of capital stock, i.e., first preferred, second preferred, common, etc. At time of such examination preferences or special stipulations should be noted. The amount of capital stock outstanding which is reflected in the accounts should be verified by correspondence direct with registrar or by examining the capital stock ledger and stubs of stock certificate books. Ascertain, in connection with the verification of the outstanding capital stock, whether there are any dividends accumulated on preference stocks. Make notation on balance sheet of amount of such dividends, if any, so that present or prospective holders of other stock issues may know their status as to future dividend payments.

Examine the **capital stock ledger** to ascertain whether balances therein are in agreement with stubs for stock certificates outstanding. Where periodic audits are made and there are few or no changes made in the stockholders, it is not necessary to examine all stubs at each audit. If a distinctive mark is placed on the stub for the last number outstanding, a verification of the changes is sufficient. Canceled certificates surrendered during the period should be examined.

Some auditors prepare, during the first audit, lists of stockholders, which are checked and brought up to date at subsequent audits, instead of preparing new lists at each audit.

DIVIDEND.—Verify rate and payment date of dividends by reference to the minutes. Make certain that dividends have been declared in accordance with legal requirements. If the dividends are paid by the corporation itself and the items are not too numerous, paid checks covering dividend disbursements should be examined. Ascertain how dividends are paid on the stock which the entries in the stock ledger or stubs indicate to be treasury stock.

SUBSCRIPTIONS TO BE COLLECTED.—Where there are subscriptions to capital stock to be collected, investigate the agreement for the subscriptions, and call attention to any subscriptions overdue. The question as to whether such debtors can pay should be looked into, so that the subscriptions may be stated properly on the balance sheet.

NO-PAR-VALUE STOCK.—Verification of no-par-value stock should be made in the same manner as for par-value stock. As to the amount at which this stock is stated in the balance sheet, examine the minutes and all other documents in connection with the stock issue to ascertain whether the stock is carried at values authorized by the directors and in accordance with the laws of the state in which the corporation is organized.

STOCK SOLD AT A PREMIUM.—Where capital stock has been sold at a premium, see that such premium is carried as capital surplus, or in some similar account. Make certain that such surplus is not used for regular cash dividends, which should be declared from the earned surplus.

SPECIAL STIPULATIONS IN CONNECTION WITH STOCK ISSUES.—In many cases preferred stocks and other stocks are issued with special stipulations through which issuing company agrees to do or to refrain from doing certain things. For instance, it may be stipulated that issuing company will maintain at all times a certain ratio of current assets to current liabilities or that no dividends shall be paid on common stock which will reduce surplus below a certain amount. Acquaint yourself with all the stipulations and ascertain whether the provisions have been carried out. Any neglect in this connection should be reported by the auditor. Persons who know that the accounts are being examined look to you to protect their interests.

Surplus

EXAMINATION REQUIRED.—Make such examination of this account as will enable you to have in your papers a complete statement of changes during the period. If the audit is the first examination made, prepare a summary of the principal changes in the Surplus account from organization of company to date, or at least for a period of years. For example, unusual adjustments should be noted, since they may give a clue to substantial changes in asset values.

ADJUSTMENTS FOR PAST PERIODS.—Some concerns charge or credit to Surplus account all items affecting prior periods which come to the surface after books have been closed. In many cases these items are comparatively small and are of such nature that similar items are likely to be omitted from figures for current year. Unless these transactions are large in amount and unusual in nature, nothing is gained by charging them to surplus instead of current operations. If desired to have such amounts stand out in the Profit and Loss account, state them separately. Inclusion of many such items in surplus frequently confuses the results of operations as reflected by the change in the Surplus account and makes necessary special explanations to clearly state the surplus changes for the period.

MISCELLANEOUS.—Ascertain whether entries in Surplus account have been made after proper authorization. Also consider the effect of such entries on statements of operations prepared monthly or at other regular intervals.

Conservative accounting demands that items which may be considered to be special earnings should be credited to surplus only after considering the advisability of reserving such amounts to take care of losses in similar transactions or even of other losses or of contingencies. For instance, what appears to be a gain on a sale of discarded machinery may, when sales of similar items of later years are considered, be in effect an offset to a loss, and it is likely that the results of such sales over a period of years may indicate

a net loss. It is, therefore, preferable in such cases to credit the excess in the first case to a reserve account.

If a certain portion of surplus has been appropriated or set aside for a definite purpose, ascertain whether the amount in question has been transferred to a separate account. Also verify the items charged against such surplus to make certain that these charges were made in accordance with provisions creating this special surplus.

Record **capital surplus** separately. Ascertain whether the changes made in such surplus were proper charges or credits to this account. Capital surplus may arise from any of following causes:

1. Sale of capital stock at a premium.
2. Gifts.
3. Sales of capital assets at a profit.
4. Increases in asset values through reappraisals.
5. Capital contributed by stockholders without issuance of additional stock.
6. An excess of assets over liabilities and capital stock at time of incorporation of company.

The two last-named items are usually called **paid-in surplus.** Cash dividends should not be paid from balances in Capital Surplus account.

On the balance sheet, appropriated or special surplus or the cash surplus should be clearly stated. Use the expression **surplus** without qualification only to designate earned surplus available for dividends.

Capital and Income

MEASURE OF INCOME.—A most important duty of the auditor is to make a clear distinction between changes which affect capital assets and those which increase or decrease income.

The income of a business has been defined as the amount by which net worth at end of the period exceeds net worth at beginning of the period.

Eliminating dividends declared and special surplus adjustments, increase in surplus is represented by the amount of net income for the period. This increase in surplus must be reflected in changes in asset and liability balances. If asset and liability balances are incorrect because of errors in determining whether certain items were capital or income entries, income account cannot be correct.

REPAIRS, RENEWALS, ADDITIONS.—Scrutinize charges to these accounts to ascertain that entries have been correctly allocated. Items representing operating expenses of the business should be included in repairs. If these items are erroneously considered as renewals and charged against the depreciation reserve or as additions and capitalized, expenses are understated and assets overstated. If renewals or additions are included in expenses, the opposite condition prevails.

APPRECIATION IN VALUE OF ASSETS.—It is not good practice to credit appreciation of assets to profit and loss. If there is reason for taking appreciation on assets, offsetting credit should be to capital surplus or to a special reserve account. No profit is realized when assets are appreciated.

SALE OF CAPITAL ASSETS.—Credit excess of sale price of capital assets over their depreciated value to a special reserve account or to capital surplus, rather than consider such amount as earnings. However, where the difference is relatively small it is generally carried to earned surplus.

WORK IN PROGRESS.—Treatment of profit on this item requires special consideration. Conservative practice is to defer taking profits until work is completed. In some cases, however, where the job as a whole can be segregated into definite sections, and it is apparent that the cost of sections to be completed will not exceed the amount allowed for it, it may be possible to determine profit made on sections completed. A safe rule, however, is to defer profit-taking until the entire job is completed, as many unforeseen contingencies may arise to increase cost of the uncompleted sections so that there will be no profit on the job as a whole.

INTERCOMPANY AND DEPARTMENTAL TRANSACTIONS.—Exercise care to eliminate intercompany or departmental profit on goods not yet sold to outsiders. Items billed to other departments and to affiliated companies at a profit may subsequently be sold at a loss.

Revenue

SALES.—When verifying revenue from sales determine:

1. That all goods which have been shipped or delivered were recorded as sales transactions.
2. That sales invoices have been correctly prepared as to prices, terms, extensions, etc.
3. That proceeds from sales have been accounted for.

The extent of work done in this verification depends in large measure on the system of internal check. Time may be wasted, unless the auditor considers work done by clients' employees before he starts verification of revenue from sales.

RECORD OF SALES TRANSACTIONS.—Except in the audits of large concerns having adequate systems of internal check, compare, for a short period, the entries for merchandise shipped with the sales orders. Investigate shipments made for which no sales orders are found to make certain that such items have either been billed or are included in cash sales and that the transactions are regular. Sales orders should then be compared with sales invoices, as a test that such items have been billed.

While examining shipping records list any shipments of discarded machinery, scrap, containers, etc., so as to trace into the records the proceeds of such sales. Make inquiry of the shipping clerk as to method of handling shipments of such material, since it is likely that shipments of this nature may not be recorded or perhaps only recorded now and then.

Consider at this time possibility of merchandise shipments being made without a record therof.

SALES INVOICES.—Ascertain whether sales invoices have been prepared in such manner that the client does not suffer loss because of errors or misunderstandings as to prices, terms, etc., or, in lesser degree, because of errors in calculations. Compare prices on a certain number of invoices, preferably those near close of period, with price lists, catalogues, or other permanent record of prices. At the same time test the terms by comparison with data relative to discounts, allowances, etc.

Examine a few invoices for shipments after close of period to ascertain whether the prices are being maintained. A considerable reduction may have been made in prices. Consider this factor in connection with inventory valuation and, if the difference is subtracted, a reduction in the inventory prices may be made or a notation may be made on the balance sheet.

Examine credit memoranda issued subsequent to the close of the period for merchandise returned, allowances, refunds, etc. If returns are excessive, consider the advisability of including them among the entries for the period under review. This may also be true of refunds and allowances.

Test credits to customers' accounts representing refunds and allowances, to ascertain whether such credits have been approved by someone in authority, and to make certain that these credits are not abnormal.

Except in audits of large enterprises having good systems of internal check, test the accuracy of the summaries of invoices and distribution of sales and sales returns.

ACCOUNTING FOR PROCEEDS OF SALES.—Sales are represented either by direct receipt of cash, as in case of cash sales, or by charges to customers. Verify the charges made to these two groups of accounts. As to cash sales, ascertain how proceeds are handled, whether the day's cash total is checked against the summary of the detailed record of cash sales and whether slips provided for cash sales are all accounted for. Make tests of the slips for a short period, proving them in totals against corresponding cash entries.

Compare totals of charge sales with amounts charged to customers' controlling account. Test credits to customers' accounts for cash collections, by comparing such entries in a section of the ledger with the cash book entries. Investigate thoroughly any journal entries credited to accounts receivable; also cash discounts allowed customers. Secure a memorandum of terms from someone in authority and make tests to determine whether rates are correct, also whether discounts have been allowed on collections which were not in accordance with terms.

GENERAL.—Ascertain that only bona fide sales made to outsiders at regular prices have been included in general sales figures. Investigate interdepartmental sales or sales made to affiliated companies as to prices, also as to the possibility that reductions or allowances may be made.

Make certain that sales of discarded machinery or other items not regularly a part of sales are not included in totals representing the regular business. State such sales separately, if possible, and likewise state the profit or loss therefrom as a separate item.

When a department store or a retail establishment having many transactions is under examination, it is not found advisable or practicable as a rule to make detailed verification of even a small part of sales entries. In such cases study closely the system of internal check relative to sales transactions. It will be found that many persons handle the entries so that the likelihood of fraud or gross errors is minimized.

INTEREST.—Verify revenue from interest and dividends. Revenue from interest is derived from two sources, viz., interest on bank balances, deposits, and loans, and interest on investments.

Verify interest on bank balances by an examination of the bank statement and test of the calculations. Note the rate of interest allowed; if lower than that usually allowed, comment on this fact in your report. Verify the rate of interest on other deposits and on loans by inspecting the contract for the loan or deposit. The fact that no interest is credited on a loan or a deposit should not be accepted as conclusive evidence that it was not intended to charge interest in such case.

Interest received on investments should be in accordance with the rate appearing on the bond or note. If no interest has been collected, verify the

fact that there has been a default by examining financial publications or by inquiry made to the proper financial institution. If the securities are coupon bonds, coupons for overdue interest should be found attached to the bonds.

DIVIDENDS.—Verify dividends on stocks as to the rate by inspecting securities for those investments having fixed dividend rates. For other securities make reference to financial publications, or for very inactive items correspond with the company issuing the stock. Dividends credited as to the number of shares should agree with the record of the securities. Be careful to make certain that any dividends earned on securities sold during the year have been credited.

RENTS.—If client receives revenue from rentals of property owned, verify amounts by examining the lease. In some cases leases provide that certain expenses or the cost of certain repairs are to be borne by lessee. Make certain in such cases that expenses of this nature are not being borne by client. Where possible, properties supposed to be vacant should be inspected by the auditor. If not possible to inspect them, try to verify the vacancies by inquiring of some representative of the client who knows about such things. If rentals are handled by an agent, obtain a statement of the balances due, rentals, etc., from the agent.

CASH DISCOUNTS.—Examine discounts received on payments made and ascertain whether maximum discounts are being received and whether all invoices on which discounts can be taken have been paid net.

INCOME FROM AMOUNTS PREVIOUSLY CHARGED OFF.—It may be possible to realize something on many items already charged off if they are properly followed up. Investigate the items charged off and make inquiries as to what is being done about following up those not absolutely bad. If the items are in the hands of attorneys, communicate with them; if not, send out another request for payment or investigate the items if they consist of obsolete or damaged merchandise, supplies, etc., written off.

SPECIAL REVENUE ITEMS.—If special revenue has been collected at any time, ascertain whether further items of the same nature may not be collected.

Expenses

PURPOSE IN VIEW.—The first step in examination of expenses is a study of the system of internal check, because the extent of the examination of the various records depends on the adequacy of the internal check.

The purpose of the examination of entries for expenses, as previously stated, is not to make certain that book entries are correct, but to ascertain whether, as evidenced by the nature and amount of the expenses, the business is being operated efficiently and economically. From experience gained in examination of various enterprises, the auditor is qualified to call attention to those expense items which are unnecessary or the charge for which is excessive. This work will give him a view of the business as a whole not possessed by any executive in the business, so that possible economies through consolidation of departments, purchases, etc., may be apparent to him. On the other hand, the auditor should not go out of his way to look for probable economies of this nature. Such things should come to his notice during the course of his regular work.

While examining the expense entries keep in mind the following:

1. Authorization of the expense by someone in authority.
2. Extent of examination of the voucher before payment.
3. Method of making payment.
4. Correct allocation in the accounts of the expense.
5. Whether the expense was really necessary.

VOUCHERS.—Procedure to be followed in examination of vouchers generally may be found under the caption "The Audit in Progress." Special points in connection with specific expenditures are discussed here.

PURCHASES OF MERCHANDISE AND SUPPLIES.—Make certain that invoices examined cover purchases **for the client delivered to him at his address.** Scrutinize items charged to merchandise purchases to make certain that they represent additions to stock, not expenses.

Many defalcations are covered through payments made to fictitious creditors for items charged to Merchandise account or similar accounts. This is especially true where the payments made for merchandise are charged direct to the account from the cash book. Examine closely any round sum amounts charged in this manner.

Investigate closely invoices for comparatively large purchases of either merchandise or supplies, especially with reference to excess stock. Note for further investigation any remarks on the invoice which indicate that a contract for a large quantity exists or that special terms have been made.

Consider the possibility that duplicate payments may be made, especially where there are many repeat orders with the same concern.

REPAIRS AND RENEWALS.—The principal consideration in the examination of charges of this nature is whether the items represent repairs or renewals, since they may in fact be additions. Study policy of client as to repairs and renewals to determine whether in the long run charges made to expense accounts will not operate to create a secret reserve. Substantial additions which should be capitalized may be erroneously included among expenses. It is conservative accounting to charge items about which there is doubt, to repairs rather than to additions. This does not mean that expenditures which clearly represent additions should be charged to expenses.

Items clearly expenses and in no sense additions may be capitalized, thereby increasing the profits unduly. Insist that such items be included among the expenses.

Ascertain whether competitive bids have been secured for all repairs and renewals of substantial amounts.

When the work in connection with repairs and renewals is done by the client's organization, scrutinize the charges to determine that no profit has been taken on such items and that overhead included is on a proper basis. Such surplus work should hardly be charged with a proportion of administrative expenses.

PAY-ROLLS.—Examination of pay-rolls should commence with a test of additions and deductions to the pay-roll and of the increases in rates. Entries representing such changes for a portion of the period, or for the entire period if the pay-roll is not large, should be compared with employment records or other original data in connection with the employment of help. Test rates paid some of the other employees by comparing with the original records. If pay-rolls are prepared from time cards or time books, make a test verification of the time by comparing the time entered on the

pay-roll with that on the cards or books. Make tests of extensions and footings and verify summaries.

Investigate the method of drawing money for the pay-roll, putting up of pay envelopes or preparation of pay checks, and paying of employees. If possible, attend at the paying of the help. Investigate method of handling unclaimed wages. Ascertain how long pay envelopes or checks which are not called for are kept before being deposited. Investigate method of handing out such envelopes or checks when called for and inspect receipts taken at that time.

Verify distribution of a few pay-rolls. Compare totals of pay-rolls with amounts of cash drawn; if amounts are not identical, make a reconciliation.

Make a comparison of the total of the wages by 3 or 6-month periods as distributed, with corresponding amounts for previous year; the differences should be considered in connection with production figures or volume of business. Investigate abnormal increases or decreases.

SALARIES.—Study changes in the salary list during the period, i.e., additional employees, increases in salaries, and names which have been discontinued. Secure authority for the new employees and for increases of salaries. Make tests of the mathematical accuracy of salary lists and of the summaries prepared. Prove totals of the salary list with cash drawn to pay salaries.

PETTY CASH.—Make a test of petty cash disbursements by examining vouchers for a portion of the period. Note the nature of the expense and the authorization and bring any large or unusual items to the attention of an executive. Summarize some of the vouchers making up a reimbursement check and prove the totals with the records. Investigate totals of vouchers for the entire period, scrutinizing any large amounts. If large items are paid in currency which could as well be paid by check, recommend change of procedure as to these items.

INTEREST AND COLLECTION CHARGES.—Compare vouchers for these charges or entries on the bank statement with entries in records. Make certain that the charges are not excessive. In case of collection charges ascertain whether a saving cannot be effected by making other arrangements for collection of items.

JOURNAL VOUCHERS.—Examine the journal vouchers for the entire period, if not too numerous. For large concerns, examine the vouchers for a portion of the period and scrutinize those for the balance of the period. Investigate the vouchers which cover charges to expense accounts, to profit and loss accounts, or to the reserves, as it is possible to cover irregularities through the medium of such entries. Entries of this nature should be approved by someone in authority.

COMMISSION TO SALESMEN, ETC.—Examine contracts or agreements with the salesmen, etc., and note any special terms. Verify commissions paid or credited with reference to special terms. Make certain that it is not intended to deduct uncollectible accounts from total sales before arriving at amount of commission paid on sales.

TRAVELING EXPENSE.—Examination of these vouchers, in addition to the scrutiny of the approvals and distribution, should include a query as to whether the amounts charged are reasonable.

INSURANCE.—Make a thorough examination of bills for insurance premiums. Consider the rates and investigate the amount of return premiums

credited. If there are many cancellations and the return premiums are received net of the brokers' commission, consider the question of having the broker pay gross or of the client taking out shorter term policies.

FREIGHT AND EXPRESS.—An audit of the freight bills which would cover the authorizations, the distributions of the charges, and the verification of the fact that the payment had been made correctly, would not be complete. Make certain that freight which is paid by client is not charged to shipper. If a purchase is made f.o.b. destination, the freight should be paid by or charged to shipper. As a matter of convenience the shipper in many cases arranges for the payment to be made at destination, with the intention that the freight will be deducted from amount of his invoice. It is possible in such case that the receiver of the goods may charge such a freight payment with others for merchandise billed f.o.b. shipping point to a freight account or to a purchase account, instead of charging the freight to the shipper. Compare some of the freight bills with the invoices of the shippers to make certain that no loss is being sustained through neglect to deduct freight charges from purchase invoices.

MISCELLANEOUS EXPENSES.—Audit of miscellaneous expenses, which include charges for services, special supplies, etc., requires consideration on the auditor's part, among other things, of the necessity for such expenses. This class of items is more likely to be omitted from the records because the expenses as a rule are not incurred periodically but only now and then. Bills for legal services, for instance, are generally received long after the services are rendered; there is a likelihood that such an item may be omitted from the liabilities if the auditor does not insist on the production of the invoice. It is important that such bills be seen, since they may furnish information relative to contingent or other liabilities not recorded elsewhere. Other bills for special services may cover instalment payments on long-term contracts. Determine whether the balances due on such contracts should not be included among the liabilities, since it may be possible that all benefits from the arrangement have been received prior to the date of the balance sheet.

General

In addition to the verification of assets and liabilities and examination of the income accounts, examine into general business policies to make certain that all the client's interests are protected.

INSURANCE.—Make certain that the amount of fire insurance carried is adequate, also that the lines carried over the year are not excessive. Examine the coinsurance clause in the policy and consider its effect on the insurance carried.

There are many special forms of insurance which may be carried to advantage by the client, such as use and occupancy, burglar, employees' liability, insurance on the lives of the officers payable to the concern, etc. Keep these in mind, and where advisable to carry some of these special forms of insurance bring the subject to client's attention. Consider the question of bonding all employees directly or indirectly connected with the handling of cash.

RECEIVING AND SHIPPING RECORDS.—Make an examination of receiving and shipping records to determine whether methods followed are such that goods are likely to be shipped without a record being made. Consider the nature of the entries made and their value as a check on the billing

records. Examine the receiving records in same manner, and trace the movements of merchandise after its receipt and until goods are consumed or shipped out, so as to be reasonably certain that the possibility of merchandise being misappropriated is remote or that any weak links in the chain have been located.

AUDIT FEE.—Consider this question before the audit commences. Make definite arrangements as to scope of the work and amount of the fee before the start. Otherwise you may make a bad impression by bringing up questions during the course of the audit about the work to be done and changes in the fee because of so-called special work. If a definite amount has been fixed for the work and the scope of the audit in a general way is apparently understood by the client, any additional work which obviously could not be provided for when the engagement was made, should be undertaken only after an understanding with the client.

Where possible, encourage the client to have work done on a **per diem basis,** an approximate amount being named for cost of the work. **Fixed fees** are generally unsatisfactory because it may be necessary to do considerably more work than first appearances indicated or the auditor may be tempted to make as large a profit as possible by "cutting corners."

MINUTE BOOK.—An audit is not complete without examination of the entries in the minutes of the directors' and stockholders' meetings. Make notations of dividends declared, salary increases, special contracts, loans, and any items covering transactions which you are supposed to verify during the course of the audit.

TRANSACTIONS SUBSEQUENT TO PERIOD UNDER REVIEW.—While an examination is restricted in a sense to transactions during the period under review, you should note any unusual transactions recorded subsequent thereto which may materially affect the financial condition after the balance sheet date. Give serious consideration to the advisability of making a notation on the balance sheet of the effect of such a change. In any event, if the balance sheet is made for creditors or for bankers, communicate the condition in question to them.

LIENS AND HYPOTHECATIONS.—Make inquiries to satisfy yourself that there are no liens on any of the assets or that they are not hypothecated. If there are liens against some of the assets, state such items separately and indicate the fact that they are not free on the balance sheet.

FRAUD.—It is not good policy to have in mind constantly the idea that you will uncover fraudulent entries. Your work should be done in such manner that if any fraud exists in transactions recorded in several months or more, it will be brought to light. When you discover items which apparently represent fraudulent entries, do not be too quick to accuse the one who appears to be guilty. Ask such party in the presence of his superior to explain the entries and give the defaulter an opportunity to confess.

BRANCH HOUSE ACCOUNTS.—If making an examination at a branch office, as well as at the head office, follow same procedure at branch as to verification of assets, liabilities, earnings, and expenses as at head office. Make a reconciliation of the inter-office accounts between the branch office and head office and verify the open items in such reconciliation.

When no examination is made of the accounts at the branch office, if branch is small and one not visited by staff auditors and not controlled by a good system of internal check, request a statement of the details of each

asset and liability account in the branch office books, as well as a transcript of the transactions recorded in the head office account during the last month or two. Study this statement closely in connection with entries found in head office books. If there is a large inventory at branch, the local representative should furnish some data relative to the old, damaged, or obsolete stock. If the branch in question is large and well controlled by head office, critical examination of reports received and an investigation of the system of internal check should enable one to determine whether assets and liabilities are correct. In any event examine a detailed statement of the cash balance.

STATISTICS AND GRAPHICS

CONTENTS

(For list of forms, see complete table of contents.)

SECTION 15

STATISTICS AND GRAPHICS*

The Statistical Method

DEFINITION.—By the statistical method is meant the interpretation of masses of data by means of processes of summarization. These processes of summarization reduce the significance of such masses of data to an intelligible basis. When studied by the statistical method, large numbers which in themselves are meaningless, are usually found to obey certain laws and so may be employed as a basis for the determination of policies.

Statistical method formulates rules of procedure in the handling of large groups of numerical data.

Applied statistics treat of the application of the rules of procedure formulated by statistical methods to concrete problems.

The **methodologist** is frequently primarily a mathematician. There are, however, certain methods which involve little or no mathematical consideration. The specialist in applied statistics may be an accountant, economist, biologist, census expert, or a state official. He applies the methods formulated by the methodologist to the problems which fall within his field.

Descriptive statistics consist of the records as ordinarily found in the volumes published by the census bureau, other governmental departments, and by private agencies. These may be studied with some degree of profit without the application of scientific methods of analysis.

Scientific statistics apply the rules and methods formulated by the methodologist to the concrete data furnished by **descriptive statistics** to secure interpretations of that data which cannot be had from mere observation.

RELATION OF STATISTICS TO ACCOUNTING.—Accounting records are the source of valuable statistical data, but this data should not be regarded as being statistical until properly classified and tabulated. From the accounting point of view figures are usually regarded individually; from the statistical point of view they are regarded collectively. Much accounting data can be usefully interpreted by means of statistical processes. Valuable comparisons can be made not only of data relative to internal conditions, but by collecting data from representative establishments progress can be made in the standardization of methods of procedure It is in this direction that much remains to be done. Various manufacturing and trading processes are subject to statistical control. Much of the original data which must be secured in order to apply statistical methods of comparison can be derived from accounting records. As yet statistics have not become as familiar to the average business man as has accounting, but nearly

*By permission of the author and publisher a considerable portion of this section is based upon "An Introduction to Statistical Methods" by Professor Horace Secrist, copyrighted by The Macmillan Company.

all large concerns have established statistical departments. These departments, if properly run, add to the value of the work performed by the accounting departments by making useful interpretations of the data which the accounting department is able to supply. Many accountants do not realize to what degree the material supplied by their records is subject to statistical interpretation. Every accountant should familiarize himself with the fundamental principles of statistical and graphic representation. He will find place for their use in the construction of his reports and statements.

STATISTICAL METHOD.—Statistical method comprehends all analytical and synthetical processes by means of which the statistician is enabled to explain the fundamental significance of groups of statistical data. This subject is considered in this section from two points of view, viz., (1) method itself, and (2) the field of application of statistical method. Professor Secrist gives the following outline of the application of statistics to business problems:

1. Application within business units.
   - (a) Analysis of sales and sales possibilities by districts, by periods, by products, etc.
   - (b) Analysis of production by departments, processes, etc.
   - (c) Analysis of employment as to rapidity of turnover, scale of payment, labor supply, welfare work, etc.
   - (d) Analysis of production and factory organization.
   - (e) Etc.
2. Application without and between business units, affecting:
   - (a) Consumption
     - (1) Family budgets.
     - (2) Price phenomena.
     - (3) Etc.
   - (b) Production
     - (1) Capital and labor employed, the absolute amounts and proportions.
     - (2) Expenses incurred and their distribution.
     - (3) Materials used—amounts and values, and their distribution.
     - (4) Products created—amounts and values, and their distribution.
     - (5) Etc.
   - (c) Exchange
     - (1) Prices—wholesale and retail.
     - (2) Sales—number and amounts involved.
     - (3) Crises—financial and industrial.
     - (4) Failures—financial, commercial, and industrial.
     - (5) Etc.
   - (d) Distribution
     - (1) Rents.
     - (2) Wages and methods of payments, real and nominal wages, etc.
     - (3) Profits—competitive and monopoly.
     - (4) Interest rates.
     - (5) Etc.
3. Application to governmental distribution and policy.
   - (a) The determination of the benevolent or malevolent effects of a given state policy.
   - (b) The determination of "fair values" and "reasonable returns" as bases for the exercise of administrative discrimination and the shaping of governmental policy.

(c) The supervision of private business methods, looking toward the insuring of competition, the regulation of monopoly, the guaranteeing of favorable conditions of employment, etc.
(d) The evaluation of properties as a basis for taxation, condemnation, and forced sales, etc.
(e) The recording of domestic and foreign trade movements, estimating national wealth and its distribution, recording national progress so far as revealed statistically.

STATISTICAL UNITS.—Statistical units are of two kinds, viz., **units of enumeration** and **units of exposition.** Statistical units are both quantitative and numerical in character, i.e., quantity in reference to a unit is always expressed numerically. Illustrations of units of enumeration are: inch, foot, meter, gallon, bushel, ton, mile, ton-mile. Units of this type are definite and fixed, but frequently it is necessary to define and limit the unit of enumeration employed with great care. Thus, in enumerating all trading establishments in a given territory it is first necessary to define what is meant by the unit of enumeration—trading establishments. This depends to some extent upon the purpose in view. Thus, the purpose may be to ascertain the number of trading establishments independently owned. If so, certain conditions govern. Or it may be to ascertain the number independently managed, in which case other conditions govern. Purpose determines the definition of units of enumeration, except in case of those of simple linear or quantitative measurements. The work of defining statistical units of enumeration of the more complex type is a problem in analysis and limitation. Thus, if we wish to define **accident** for purpose of workmen's compensation it is necessary first to analyze the law governing workmen's compensation in the given jurisdiction and then limit the application of the unit accordingly. Accurate definition of statistical units must precede any attempt at collection of data.

Units of enumeration are **simple** and **composite.** Simple units are those which are unqualified. Examples: horse, boat, farm, building. Composite units are those which are qualified. Examples: black horse, steamboat, dairy farm, brick building. The process of limitation as applied to units of enumeration is dependent entirely upon the purpose of the enumeration.

Units of exposition are employed to **interpret** data collected in accordance with units of enumeration; also to **present** the results of such interpretation in the best form possible. Interpretation means comparison. Data which are numerated according to certain units must be used to make comparisons to be of value. Thus, we wish to know not only the number of a given article sold in a given state, but we have a basis for comparison with other states if we know the sales per 1,000 population. If it is 100 per 1,000 inhabitants in a given state, then the coefficient is .1. This can be compared with similar coefficients for other states. If the article is one which appeals only to a given class of persons, the sales must be related only to the number comprising that class. This produces a **corrected coefficient.** This is illustrative of Quetelet's dictum: "Never compare data which have nothing in common." Differences in time and space may make comparisons useless.

Coefficients, when regarded from the point of view of practical usefulness, make necessary a consideration of **units of presentation.** Comparison must be such as will give effective representative results. Little good is secured from coefficients derived from data taken from such large areas that variations in conditions within such areas are hidden. Coefficients

derived from non-homogeneous data are meaningless. For many purposes the average per-capita sales of tobacco per annum in the United States is meaningless because it is based on total population instead of on the number of persons using tobacco. The per-capita sales for tobacco users by states would be a step nearer to a corrected coefficient of presentation.

Illustration.—A study is to be made of operating expenses of grocery stores. It is necessary to define what is meant by the unit—grocery store; also what is meant by operating expenses. Having properly limited the use of the expression "grocery store" so that the one assigned to collect primary data can exclude all stores not coming within the field as thus circumscribed, it is next necessary to secure a classification of operating expenses typical of the grocery business. It thus becomes necessary to define each item of operating expense, the extent to which division of operating expense is carried being subordinate to the object in view in making the investigation. Having thus defined all statistical units and having secured data in accordance therewith from a wide area, it is apparent that for purposes of comparison the coefficients expressed as rates of the various items of operating expense to net sales are not corrected coefficients if based on average results for the entire country. Two steps are necessary to secure corrected coefficients: (1) classifications on a geographical basis in order that variations resulting from geographical position may be brought out, and (2) classification on basis of capitalization in order that variation resulting from differences in size of undertaking may be brought out. When this is done, corrected coefficients are secured and these may be employed for making intelligent comparisons between grocery stores of various capitalizations and between grocery stores having different geographical locations.

Statistical Classification

DEFINITION.—Statistical classification consists in the arrangement of statistical data to facilitate its uses for purposes of interpretation and comparison.

TABULATION.—Tabulation is based on classification. Classification is the basis of orderly thinking, and consists in arranging statistical data into

Table 1. Condensed Statement of Manufacturing Costs

	Year 1922		Year 1923	
	Dollars	% of Total	Dollars	% of Total
Raw Materials	$ 320,000	31.07	$287,600	37.06
Direct Labor	441,500	42.86	301,300	38.83
Manufacturing Expense	268,500	26.07	187,100	24.11
Total	$1,030,000	100.00	$776,000	100.00

groups in accordance with the character of the data. After classification, tabulation consists in arranging data thus classified in form of tables. Tables are arranged as flat surfaces containing classified data which may be read from either of two starting points, viz., (1) the stub, which shows the basis of horizontal classification, or (2) the caption, which shows the basis of vertical classification. Tables possess the advantages which classified data possess over unclassified data. These may be summarized as, regularity, comparability, compactness, legibility. Table 1 is one of the first order, that is, one in which all of the details are classified according to certain common characteristics.

Certain conditions control method and arrangement in tabulation. One factor, frequently, is time, in which case the arrangement is chronological. Other arrangements are based on geographical location, magnitude, and the alphabet. In the above table time is the controlling factor, vertically, but it is doubtful whether any factor was consciously employed in determining the horizontal position because of the fewness of the items. In Table 2 time is the controlling factor in horizontal arrangement.

Table 2. Schedule of Accumulation—Bond Payable May 1, 1923

Date	Total Interest 3%	Net Income 4%	Accumulation	Book Value	Par
1918, May 1.....	....	....	....	$ 95,508.71	$100,000.00
Nov. 1.....	$ 1,500.00	$ 1,910.17	$ 410.17	95,918.88	
1919, May 1.....	1,500.00	1,918.38	418.38	96,337.26	
Nov. 1.....	1,500.00	1,926.74	426.74	96,764.00	
1920, May 1.....	1,500.00	1,935.28	435.28	97,199.28	
Nov. 1.....	1,500.00	1,943.99	443.99	97,643.27	
1921, May 1.....	1,500.00	1,952.87	452.87	98,096.14	
Nov. 1.....	1,500.00	1,961.92	461.92	98,558.06	
1922, May 1.....	1,500.00	1,971.16	471.16	99,029.22	
Nov. 1.....	1,500.00	1,980.58	480.58	99,509.80	
1923, May 1.....	1,500.00	1,990.20	490.20	100,000.00	
	$15,000.00	$19,491.29	$4,491.29		

Where geographical distribution is considered in the United States Census Reports, the order of arrangement usually is as follows: New England, Middle Atlantic, East North Central, West North Central, South Atlantic, East South Central, West South Central, Mountain, Pacific.

Arrangement must always be considered as a function of purpose and should be varied when the purpose changes if a more effective presentation can be secured.

Material should not be allowed to take tabular form without first being subjected to careful examination to determine the relationship of the different parts. An inspection of Table 2 above will make this clear.

PREPARATION OF DATA.—After preliminary classifications are determined upon, statistical data are usually gathered in the form of schedules and are transferred to tabular forms. Sometimes intermediary processes are necessary. Since the first principle of tabulation is classification, it is

necessary to arrive at a correct basis of classification before tabulation is begun. The data is to be divided into certain classes and these must be segregated for the purpose of arriving at totals. For this purpose tabulation cards are used. The data is transferred to the cards in accordance with the nomenclature adopted, each card representing a given class or group of data. For convenience symbols are sometimes used in place of words in describing given classes of data. If the amount of data to be tabulated is large, mechanical tabulating machines may be used. The Hollerith and Powers machines are both widely used. After the data are transferred to cards, these must be sorted according to the classification determined upon as the basis of classification. This may be done mechanically where statistical machines are used, although cards punched mechanically may be sorted by hand. Ordinarily there will be as many groups of cards as there are groups to be tabulated. Each group may be sorted into as many subgroups as desirable. The next process is counting, to determine the number in each group and subgroup. Where large numbers must be counted a listing machine should be used.

TECHNIQUE OF TABULATION.—The technique of tabular forms is a function of the information to be presented. It may be desirable to present one or more facts regarding a given class of data, and ordinarily the number of facts to be presented determines the construction of the table. In Table 3 are tabulated the amounts shown for cash in the annual balance sheets of the American Bank Note Co. for the years 1917-1921, inclusive.

Table 3. Cash of American Bank Note Co., by Years

Year	Amount of Cash
1917	$ 697,372
18	588,012
19	1,919,447
20	1,276,652
21	1,759,929

In Table 4 are shown the amounts of the assets of the American Bank Note Co. for the years 1917-1920, inclusive.

This arrangement may be reversed, the years being placed at the top and the asset captions at the side, in which case the arrangement is that of a comparative balance sheet. The **form to be adopted** is the one which best brings out the relationships which it is desired to emphasize. In addition, certain other considerations of general character must be allowed for. One is the **physical limitation** of the printed page. An arrangement which crowds either dimension of the page should be avoided. Where totals are to be shown, their position must be carefully considered. Until recently it has been customary to show these at the bottom of the page, but it has now become the frequent practice to show them at the top as in Table 5. This places the totals in the most conspicuous position, which is their proper place if it is desired to emphasize them.

Table 4. Assets of American Bank Note Co., by Years

Year	Real Estate	Materials and Supplies	Accounts Receivable	Notes Receivable	Marketable Investments	Contract Deposits	Special Deposits	Cash	Deferred Charges
1917..	$8,555,294	$1,431,507	$1,058,500	$1,601	$ 268,600	$55,595	$121,092	$ 697,372	$60,233
18..	8,652,111	2,400,050	1,134,630	367	189,307	55,520	128,457	588,012	32,957
19..	8,002,617	2,438,704	2,187,412	....	418,690	55,720	140,549	1,919,447	21,917
20..	8,853,020	2,953,950	2,105,800	....	1,608,950	55,520	....	1,267,652	12,503

Table 5. Number of Real Estate Mortgages in Kentucky, by Years

Year	Number of Real Estate Mortgages in Kentucky		
	Total	Taxable	Non-Taxable
Total.........	....	....	....
1915.............			
16.............			
17.............			
18.............			
——.............			
——.............			

Great care should be exercised in formulating the titles of statistical tables. While they should be brief, they should state clearly what the contents are. Improperly worded and arranged titles are a frequent cause of failure in presenting useful data.

The **nature of the data** to be tabulated must be taken into consideration in determining the form of table to employ. In case of historical data time is a controlling consideration and must dominate the arrangement. Where data give a cross-sectional view as at a given time, the factor of time may be ignored except in the title. In preceding illustrations time is a controlling factor. In Table 6, showing the range of prices of certain stocks on the New York Stock Exchange on Sept. 21, 1922, time is not a controlling factor in determining tabular arrangement. Here alphabetical arrangement controls horizontally, while order of sales controls vertically. In a sense, time is a factor, since the "open" price occurs first and the "close" price last, but this is not true of the "high" and "low" prices.

Table 6. High, Low, and Closing Prices of Eight Industrial Stocks on the New York Stock Exchange on Sept. 28, 1922

Name of Stock	Open	High	Low	Close
American Locomotive......	124	$124\frac{7}{8}$	$121\frac{1}{2}$	$121\frac{1}{2}$
Beech-Nut Packing........	$43\frac{1}{2}$	$44\frac{1}{2}$	$42\frac{5}{8}$	$43\frac{3}{4}$
Continental Can...........	$87\frac{1}{2}$	88	86	86
Hudson Motors............	$22\frac{1}{8}$	$22\frac{1}{8}$	22	22
Marin Rockwell...........	17	17	17	17
Moon Motors.............	$16\frac{3}{4}$	$16\frac{3}{4}$	$15\frac{1}{8}$	$15\frac{1}{8}$
